Berkshire encyclopedia of world history / William H. McNeill, Jerry H. Bentley, David Christian, editors. — 2nd ed.

p. cm.

Includes bibliographical references and index.

Summary: "An integrated view of the history of our global community from a 21st-century perspective, with a focus on environmental and social issues. The 580 articles, edited and written by scholars around the world, examine connections and interactions made over time (and across cultures and locales) through trade, warfare, migration, religion, and diplomacy"—Provided by publisher.

From the earliest stages of planning the encyclopedia to its fruition as a second edition, our goal has been to present a body of knowledge whose core is about the movement, interaction, and change that has shaped the world. With that continued focus, on connections and movements over and across time and place, we've designed our Reader's Guide. Its thirty-five topical, alphabetically organized categories—under which we list all the entries relevant to each category—emphasize the ways in which a specific subject can apply to more than one broad field of study. Textiles, for instance, can reveal a people's aesthetic sense and development, as well as provide insight about socioeconomic, political, and cultural aspects of a people. Thus the article "Textiles" appears under the categories Arts and Literature, Commerce—Trade Goods and Products, and Daily Life.

The categories themselves often reflect important themes—lenses through which we view a particular aspect of history—such as Conflict and War or

Diplomacy and Peace. Some categories are based on geographical constructs, others on governments or states. Still others group processes, models, or forces that have driven history over the centuries. We've "dispersed" the names in our Biography category to indicate the places where these figures had their primary or initial influence, and (wherever possible) the field, discipline, or specific topic in which they made an impact. The British political economist Thomas Malthus (1766–1834), for example, one of the first to warn against the dangers of overpopulation, appears under Environment and Ecology; Europe; Philosophy, Ideas, and Thoughts; and Population, while we list Olaudah Equiano (1745–1797), the African writer and abolitionist, under Africa; Americas; and Social and Political Protest Movements.

We include the Reader's Guide here—and of course in its interactive form for online subscriptions—as a valuable resource for students, teachers, course planners, and general readers alike.

World history is both very new and very old: new because it entered high school and college classrooms only in the last fifty-five years, and old because it dates back to the first historians' attempts to answer an age-old question—"How did the world get to be the way it is?"—in a different, more adequate way. The most obvious answer was a creation story, and creation stories were probably universal among our remotest ancestors, since they sufficed to explain everything—as long as people believed that the world continued as it began, with only seasonal and other cyclical repetitions such as birth and death.

But in the second half of the first millennium BCE, in three different parts of the world, social and political changes became so swift and unmistakable that a few individuals in Israel, Greece, and China pioneered what we call historical writing. The historical books of the Jewish scriptures, as edited after the return from exile in Babylonia (subsequent to 539 BCE), recorded in some detail God's universal jurisdiction over history from the time of Abraham—and more generally from the moment of creation in the Garden of Eden. Soon afterward, the Greek historian Herodotus (484–425 BCE) set out to award "a due meed of glory" to the deeds of Greeks and barbarians within a wide circle extending from Egypt in the south to Scythia (modern Ukraine) in the north, touching on India to the east, and extending throughout the Mediterranean coastlands to the west. About three centuries later, the Chinese historian Sima Qian (c. 145–85 BCE) brought Chinese historical records, already voluminous, into comprehensible order by

writing a comparably far-ranging account of China's ruling dynasties from their beginnings, including their relations with a wide circle of adjacent barbarians. Faint traces of contact between the Chinese and Mediterranean worlds have been detected in Herodotus's remarks about mythical peoples living somewhere beyond Scythia, but for all practical purposes the historiographical traditions of China, Greece, and the biblical scriptures remained independent of one another for many centuries.

By the fifth century CE Saint Augustine (354–430) and others had given the Christian version of world history an enduring form, building on Jewish precedent, modified by faith in human redemption through Christ's sacrifice, and anticipating a Day of Judgment when God would bring the world to an end. This remained standard among Christians through succeeding centuries and soon was matched by a Muslim version of the same story, starting with Creation and ending in the Day of Judgment as freshly set forth in Muhammad's revelations.

In China the structuring of world history around the rise and fall of imperial dynasties, pioneered by Sima Qian, remained unchallenged among Confucian scholars until the twentieth century. But in the Western world, as early as the fourteenth century, Jewish, Christian, and Muslim religious narratives began to compete with the revived interest in ancient and pagan Persian, Greek, and Roman historians. Accelerating social change that did not fit easily with religious expectations also disturbed older ideas. This provoked a handful of thinkers to propose

new views of world history. Among Muslims, Ibn Khaldun (1332–1406) stands pre-eminent; he developed a thoroughly secular, cyclical and strikingly original theory of social change. Among Christians, Giambattista Vico (1668–1744), perhaps the most provocative thinker, set out to fuse the Christian and pagan traditions of historiography into what he called a “new science” of social change that also featured cyclic repetition. But such radical new ideas remained exceptional. Nearly everybody remained content with at least lip service to familiar religious accounts of God’s plan from Creation to the Day of Judgment—even when Muslim poets revived the Persian language as a vehicle for celebrating ancient pagan chivalry, and among Christians the study of Greek and Roman classical authors, including historians, began to infiltrate schools and universities.

In the early nineteenth century, however, when medieval and modern history first entered the curriculum of leading German universities, liberal and nationalist ideas dominated the minds of those who set out to discover “what really happened” by investigating state archives and medieval chronicles. These scholars hoped to discard superstitions and other errors by careful source criticism and, intent on detail, assumed that all the true and tested facts of history would speak for themselves. And speak they did, shaped as they were by questions about the national past from eager researchers who wanted to understand why German states had come to lag so far behind the French in modern times.

Simultaneously, source criticism began to challenge the Christian version of history as never before by treating biblical texts as human handiwork, liable to error just like other ancient, often-copied manuscripts. This style of historical research soon spread from Germany to the English-speaking world, even infiltrating France after 1870. Detail and more detail often became an end in itself, and the enormity of

available source materials grew steadily as new sub-themes for investigation proliferated. Nonetheless, by the close of the nineteenth century Lord Acton (1834–1902) and others—drawing largely on classical precedents—created an overarching liberal interpretation of history: it flattered French, British, and U.S. national sensibilities so well that it soon dominated schooling in those countries.

At risk of caricature, this liberal-nationalist version of world history can be summarized as follows. What mattered in the past was the history of liberty, since free men, acting voluntarily, were more efficient both in war and in peace and thus acquired collective power and wealth, as well as all the satisfactions of personal freedom. So Europe, and more specifically western Europe, was where history—significant history, that is—happened, and elsewhere endless repetition of insignificant routines prevailed. Thus Leopold von Ranke (1795–1886), the most revered German historian of his time, could say in his nine-volume *World History* (1882–1888) that history ended for Muslims in 1258 with the Mongol sack of Baghdad, since by then they had fulfilled their world historical role of transmitting important Greek texts to medieval Europeans!

Those texts were important because they helped to show how ancient Greeks and republican Romans pioneered the history of liberty. But ancient liberty did not last and had to be refreshed in western Europe by barbarian invasions in the early Middle Ages, followed by slow and precarious constitutional and legal innovation, punctuated by sporadic revolutionary upheavals, all aimed at restraining tyrannical government and dogmatic religion. By the end of the nineteenth century, the principles of liberty embodied in representative government and religious freedom had become clear, and their fruits were apparent in the superior power and wealth that Great Britain, France, and, *in potentia*, the United States enjoyed.

But Germany and Russia were also eager aspirants to greatness, and clashing national ambitions in due course provoked World War I.

This was the view of history to which I was apprenticed in the 1920s and 1930s, even though my teachers had half forgotten the reason for the distribution of attention that prevailed in their classrooms. Yet World War I had already profoundly challenged the theme of progress toward constitutional perfection upon which this naive and ethnocentric version of human history rested. Freedom to suffer and die in the trenches was a questionable climax to liberal progress; the prolonged depression that set in after 1929, followed by World War II, cast still further doubt on the idea that the recent emergence of constitutional government, as exercised in a few nation-states in a small part of the world, was what gave meaning to the whole human past.

As usual, a few restless thinkers responded. The most notable were Oswald Spengler (1880–1936) in Germany and Arnold J. Toynbee (1889–1975) in Great Britain, both of whom elaborated on classical notions of cyclical rise and fall by treating western Europe as one of several parallel civilizations that followed similar, perhaps even identical, patterns of growth and decay. Spengler and Toynbee both attracted many readers by offering a new explanation for the shifting currents of world affairs, but academic historians paid scant attention, busy as they were pursuing ever more numerous hotly debated questions about specific times and places in the past.

Their investigations expanded literally around the globe after World War II, when Asia, Africa, and every other part of the world started to attract the efforts of professional historians. Simultaneously, archaeologists and anthropologists were exploring the deeper, unrecorded past as well. The resulting very rapid advance in general information about diverse local pasts soon allowed a few ambitious

world historians to develop more inclusive, more nearly adequate versions of the whole human career. In the United States serious efforts to teach world history also began to invade high school classrooms after World War II, as U.S. entanglements abroad became more and more obvious. Colleges and universities lagged behind, but of late many have also begun to teach the subject.

What to emphasize and what to exclude remained a critical question, for, like other scales of history, an intelligible world history requires selective attention to the confusion of knowable facts. Some world historians chose to organize their books around the rise and fall of civilizations, as Spengler and Toynbee had done; others took a continent-by-continent approach. A school of Marxists emphasized a world system in which better-organized core states exploited peripheral peoples for their own enrichment. But the debate about whether such world systems were very ancient, or dated only from the rise of modern capitalism, divided this school into clashing factions. Others argued that cooperation was more significant than exploitation and that communication, allowing the spread of new techniques and ideas within geographical and ecological limits, was the governing pattern of world history.

No single recipe for writing and studying world history has yet emerged and none ever may, since different peoples, with different heritages and different local conditions, are sure to remain at odds with one another, even if globalization persists and intensifies in times to come. But it seems certain that as long as entanglements with the rest of the world remain as inescapable as they are today, national and local history will not suffice to explain how things got to be the way they are. In that case, that age-old question will surely continue to require teachers and scholars to provide some sort of world history for an answer.

This pioneering *Berkshire Encyclopedia of World History*, now in its second edition, is designed to help both beginners and experts sample the best contemporary efforts to make sense of the human past by connecting particular and local histories with larger patterns of world history. Contributors have no single viewpoint, but the editorial process, in choosing what articles to commission and how to distribute attention, aimed at inclusiveness and aspired to insight. How well

we succeeded is for users to discover. The only thing uniting those who cooperated to produce this volume is the belief that human history as a whole is important to study and think about, since genuinely inclusive world history is such a helpful, even necessary, guide for survival in the crowded world in which we live.

William H. McNEILL
Colebrook, Connecticut

Introduction to the 2nd Edition

The *Berkshire Encyclopedia of World History* is, we believe, the first truly *encyclopedic* resource for world history. We've chosen that adjective to reflect the etymology of *encyclopedia* as a "circle of learning." Indeed, from its conception, we intended our encyclopedia to contain a body of knowledge whose core is about the movement, interaction, and change that has shaped the world as we know it today. Beginning with the first edition, published in 2005, the encyclopedia has taken a dynamic world history perspective, showing connections and interactions over time and place through trade, warfare, migration, religion, and diplomacy. In its introductory pages David Christian explained the three periods in human history—the foraging era, the agrarian era, and the modern era. (These essays have now become a popular book called *This Fleeting World: A Short History of Humanity*.) In the articles that followed, a total of 330 historians, archaeologists, anthropologists, sociologists, geographers, and other experts from around the world examined essential themes and patterns, such as government, science, and the arts, then took a closer look at processes, movements, places, events, and people.

Early reviews praised the first edition as "masterful . . . the benchmark against which future history encyclopedias [will be] compared" (*Booklist*) and an "engaging analysis of how history has been shaped" (*Choice*). Students and teachers at the high school and college levels, as well as scholars and professionals, adopted the first edition as a definitive work for a

connected, holistic, view of world history—the story of humans and their place on Earth.

Now, six years later, we are proud to publish a revised six-volume second edition with continued emphasis on the broad themes that help students orient themselves in world history, and an even greater

At a White House ceremony in February 2010, President Obama presented the National Humanities Medal to William H. McNeill for "expanding our understanding of the world," apt words for McNeill's lifelong commitment to scholarship and teaching.

William H. McNeill with Jerry Bentley and a student at the World History Association Conference, 2009.

focus on interdisciplinary approaches to traditional subjects—biological and physical sciences, economics, and the visual arts.

Berkshire has tackled many ambitious projects since publishing the first edition of the *Berkshire Encyclopedia of World History*, including the four-volume *Berkshire Encyclopedia of World Sport* (2005), the five-volume *Berkshire Encyclopedia of China* (2009), and the ten-volume *Berkshire Encyclopedia of Sustainability* (the complete set will be available in 2011). We've also launched "This World of Ours," a series of tiny books on huge topics: David Christian's *This Fleeting World* (in its third printing, this time with an endorsement from Bill Gates), *This Is China* (distilled from the work of our distinguished contributors to the *Encyclopedia of China*), and *This Is Islam* (written by a renowned scholar of Islam) will be followed by *This Good Earth: Sustainability Through the Centuries*. Our forthcoming *Dictionary of Chinese Biography* will tell the "story" of China through the remarkable (and not always famous or "recognized") men and women whose lives helped shape the country over millennia. But publishing a second edition of one of our titles was something we had never done before. Where to begin?

Putting Western Civ Behind

First we renewed our commitment to the teaching of world history, no longer just a study of civilizations, regional histories, chronology, and "great men" but a dynamic field that recognizes over time and place the importance of interactions, connections, and exchanges—of people, other organisms, ideas, and material goods. World historians today, we believe, take an increasingly comparative approach that examines what happened in different places at the same time and thus helps us to understand why life has not always been the same in all places at all times.

Historians themselves have come to the field from many different paths. William H. McNeill once noted in an interview that he was drawn to world history in the 1930s by the work of the anthropologist Clark Wissler, whose studies of social change among Plains Indians provided an intriguing model of culture change. Another of our editors, David Christian, looked toward world history to find the answer to his students' very basic and sensible question, When did history begin? His search led him to archaeology, paleoanthropology, astronomy, and biology, resulting in a synthesis of these seemingly unrelated disciplines within a field he coined as "big history"—a course of study that places the history of humanity and the Earth in the very largest of contexts, that of the universe.

Reassembling Our Editors

Our first-edition editorial team, and the core group that inspired and supported our work on this edition, came together under the direction of William H. McNeill. In the late 1990s, while working on another world history project, the distinguished U.S. presidential historian Robert Ferrell suggested

Planning the *Berkshire Encyclopedia of World History* in October 2002, a group of historians met in Great Barrington. Shown here, after a luncheon at the Egremont Inn, are Judith P. Zinsser, Heidi Roupp, J. R. McNeill, Elizabeth McNeill, William H. McNeill, David Christian, David Levinson, Ralph C. Croizier, and Alfred J. Andrea.

I contact Bill, who had retired to a family home not far from Berkshire Publishing's location in western Massachusetts. From the start Bill blessed us with advice, always generous and sometimes cautionary. Over the years he followed Berkshire's progress with publications we prepared for other publishers. Perhaps our successful creation of the *Encyclopedia of Modern Asia* (Scribner's 2002) convinced him we could produce the goods when we announced our plans to launch our independent publishing imprint with an encyclopedia of world history.

Bill, who understands the web of communication that enables human creativity and invention, initiated the connections that in turn have made this remarkable project possible (in both editions). He introduced us to, among others, Heidi Roupp, founder of the e-journal *World History Connected*, and David Christian, author of *Maps of Time: An Introduction to Big History* (2004). (Christian, along with John McNeill, Bill's son, attended what we fondly think of as the encyclopedia's first official meeting, held on the porch of Bill's Colebrook, Connecticut,

home in August 2002.) John, then the lead editor of our *Encyclopedia of World Environmental History* (Routledge 2004), had already suggested I contact Jerry Bentley, the editor of the *Journal of World History*. And thus we established our connections in the field.

We held a small conference for our editors in October 2002, an ideal time of year to bring people to the Berkshires, a region renowned for its rural beauty and, especially since the early nineteenth century, its cultural bounty. The participants met for two days to frame the encyclopedia, develop a mission statement, and work through several significant areas of debate. Judith Zinsser, whose expertise in women's world history made her a valuable member of our editorial group, joined us, as did Ralph C. Croizier, from the University of Victoria (and the then president of the World History Association), and Alfred J. Andrea, the current WHA president (as of 2010), from the University of Vermont.

Less than seven years later, when we asked our first-edition editors to commit to a second, the

This Fleeting World author David Christian with William H. McNeill, discussing *The Rise of the West* and other publications.

response was overwhelmingly enthusiastic. Ralph, with a special mission to expand and sharpen our art coverage—especially as visual (i.e., non-textual) studies are beginning to play a larger role in how we see world history—officially signed on with Bill, John, David, and Jerry. Not only were they quick to suggest additional topics and recommend leading scholars to write about them—including Jason Thompson (“Egypt”), Elizabeth L. Eisenstein (“Printing”), Oliver Rackham (“Trees”), and Thomas Bender (“United States of America”)—they made new contribution themselves: David with “Anthropocene” and “Big History,” Bill with “Economic Cycles,” “Terrorism,” and numerous others), John with “Population and Environment,” and Ralph with “Art—World History and Art.”

Reorganizing—Or Not

When organizing the first edition we felt a strong need to be faithful to the guiding principles of world history, but we also wanted the content to be easily accessible to readers. When we discussed this problem at our first planning session in 2002, David

Christian had worried that it would be difficult to arrange in book format a body of knowledge that at its core stresses movement, interaction, and change over time.

Thus we rejected the traditional chronological approach that delineates eras in world history and then divides up the articles accordingly. (Using that scheme, where would we have put our article “Extinctions,” which takes readers back some 3.5 billion years to the beginning of life on Earth, and plunges them into the future by contemplating a sixth mass extinction brought on by global warming?) World historians do not generally agree about how to separate the history of the world into eras; they know that eras simply do not begin or end at one point in time, that the start and end date of a particular era can vary widely across regions, and that often the transformations occurring across eras are the crux of the history to be told.

We also rejected the “peoples and cultures” scheme of organizing the content geographically (Africa, Europe, etc.). That approach was neither faithful to world history nor helpful to users, as many of our entries (“Trade Patterns—Indian

Ocean,” for example, or “British Empire”) cross not only regions (and eras) but also topics. The “peoples and cultures” scheme also seemed inappropriate because it encourages what John McNeill calls the “horse race” aspect of history: setting different civilizations in competition.

We finally decided on a combination of the alphabetical approach—the usual and best scheme for an encyclopedia—and a topical approach. By arranging the content alphabetically, we make it easy to find the entries; by including ample cross-references we help create the sense of movement and connection that David Christian identified as vital to our project. Our Reader’s Guide—with thirty-five topical categories, under which we list all the entries relevant to each category—further emphasizes the ways in which a specific subject can apply to more than one broad field of study. Textiles, for instance, can reveal a people’s aesthetic sense and development, as well as provide insight about socioeconomic, political, and cultural aspects of a people. Thus the article “Textiles” appears under the categories Arts and Literature, Commerce—Trade Goods and Products, and Daily Life.

Other wide-ranging topical categories in our Reader’s Guide, such as Health and Disease, Technology and Science, and Religion and Belief Systems, contain within themselves eleven “overview” articles written by renowned scholars—for example, Martin Marty on Religion, David Christian on Science, Daniel R. Headrick on Technology, and William H. McNeill on Disease. This coverage of major themes and patterns in world history has become a distinctive part of our encyclopedia, preparing students and teachers for the “specialist” view in such topics as sacred law or shamanism, alchemy or metallurgy, wind or water energy, and malaria or HIV/AIDS.

With our emphasis on connections and movements over and across time and place, the encyclopedia must also allow users to see connections across articles, to move through the encyclopedia easily, and to find additional resources for advanced or specialized study. Thus the extensive cross-references listed at the end of articles point readers to other related entries, and the index contains both volume and page numbers for easy access. A bibliography (“Further Reading”) section for students and teachers to consult follows each of our 580 articles.

Two changes in our second edition reflect conventions we adopted in 2008, with the *Encyclopedia of China*, for all our encyclopedia publications. First, in the “signatures” of all the scholars and experts who write for us, we now format family names with all-capital letters; this is common practice in international academic circles and especially valuable in a work with numerous Asian and non-Western authors. Second, we now provide an abstract, a 65-word-or-so summary, for each article. (That decision prompted us to rethink our book design and begin each article on a new, wide-margined page—an aesthetic and practical advantage for teachers who want to photocopy articles for classroom and/or homework assignments.) Abstracts, we believe, can provide immediate context of our coverage for a reader familiar with the topic, or they can entice a novice to explore the topic. Abstracts contribute to the reader’s first impression of an article, whether on the printed page in a hard-bound volume or when they appear separately from the article, in an online resource or reader’s guide.

Reassessing Our Approach, Expanding Our Content

The major challenge for authors of our first edition was writing from what we call “a world history

much of this scholarship.) Lauren Arnold describes in detail one particular "Silk Road journey" in her book *Princely Gifts and Papal Treasures: The Franciscan Mission to China 1250-1350 and Its Influence on the Art of the West*. For influence flowing the other way, Arnold has shown how the image of the Virgin Mary with the baby Jesus, brought to China by fourteenth-century Franciscan missionaries, was transferred into Chinese portrayals of the child-giving goddess, Guan Yin.

The question of Chinese contributions to European Renaissance art is still contentious with

most art historians not accepting Arnold's views or those postulating Chinese influence on Giotto published earlier by the Japanese art historian, Hidemichi Tanaka. But mainstream Western art history has recognized that the Renaissance was not entirely a European affair as several well-received books have appeared in the last decade or so showing the connections in art, architecture and culture between Italy, particularly Venice, and its Eastern Mediterranean trading partners in Istanbul, Cairo, and elsewhere. (See Jerry Brotton's *Renaissance Bazaar*, 2002, and his collaboration with Lisa Jardine,

Lauren Arnold, author of *Princely Gifts and Papal Treasures*, noticed a striking similarity between a scroll (left) signed by Tang Yin (1470-1523) and the famous eighth-century painting (right), *Salus Populi Romani*, in Rome's Santa Maria Maggiore. Most likely missionaries had carried a copy of the iconic Roman work to China, where Tang Yin was inspired to adapt the image of the goddess Guan Yin in his portrayal of the Virgin Mary. Nobilio Conservation Studio.

Global Interests: Renaissance Art between East and West, 1996).

In the ensuing age of European maritime expansion these cross-cultural connections expand beyond the Silk Roads and the Mediterranean to become global, especially with the spread of the Jesuit mission. *Art and the Jesuit Missions in Asia and Latin America, 1542-1773*, by Gavin Alexander Bailey (2001), and *The Jesuits and the Arts*, edited by Bailey and John W. O'Malley, deal with the visual arts in this premodern occurrence of globalization. Another art historian, Michael Sullivan (1973), looks beyond the Jesuits and brings the interchange between European and East Asian art (Japan as well as China) up to the twentieth century in his pioneering study *The Meeting of Eastern and Western Art*.

In the four decades since Sullivan's broad-gauged survey, other art historians have conducted more focused research on particular cases of East-West contact and intra-Asian interactions. One example is the work of Aida Wong, now a resident in the United States but significantly from Hong Kong, that meeting place of international and transnational influences. Wong's recent book, *Porting the Mists: Discovering Japan and the Rise of National-Style Painting in China* (2006), internationalizes the art history and cultural history of twentieth-century East Asia. A shorter work of Wong's, "Landscapes of Nandal Bose (1882-1966): Japonism and Populism in Modern India," published in *Shadows of the Past: Okakura Tenshin and Pan-Asianism* and edited by Brij Tankha, is even more clearly world history, or world history through art, with its revelations of how pan-Asian thought arose in reaction to Western colonial dominance.

Later in the globalized twentieth century, these connections are even more obvious. To take just three of many art histories dealing with East-West artistic interchange in the last century, there is Shiji Takashima and Thomas Rimer's *Paris in Japan*, published by the Japan Foundation in 1987; Partha Mitter's *Art and Nationalism in Modern India* (1995), and Liliane Karouk's 2004 study *Modern Egyptian Art, 1910-2003*.

Utagawa Sadahide (1807-1873). This ukiyo-e style Japanese print shows a Dutch family along the shoreline in Yokohama; a Dutch ship is at anchor in the background. As an example of a European subject rendered in traditional Japanese style, the print attests to the East-West cultural exchange. Library of Congress.

Such studies can contribute significantly to world historian's efforts to trace the emergence of global styles, global culture, and the complex questions of cultural identity they produce. This is also the area where visual and cultural studies may be most useful, and world historians should not ignore the work on small societies by cultural anthropologists well represented in the essay collection, *Exploring World Art* (Venrux et al. 2006). Beyond the small societies and tourist art described in those essays, there are other examples of globally circulating pop culture and art, such as the

The illustrations on these pages, from "Art—World History and Art" by Ralph C. Croizier, show cross-cultural influences in painting throughout history, from Rome to China and from the Netherlands to Japan.

perspective." It wasn't always clear to them—or to us—exactly what that entailed. An ideal article, we believed, would show how its subject changed over time; address the subject's connections with other concepts, times, and places; and state the subject's significance for (and influence on) the present. But it took concrete examples, not abstract discussion, to make clear what was truly successful. Consider the story of our article "Glass."

The article as submitted said a great deal about the influence of glass on history—on the scientific revolution, on household hygiene—but relatively little about the history of glass itself. As such, it fit well within our world history approach. But our experienced staff editors expected the article also to include information about how glass is made, or to cover technical improvements in its manufacture. We

realized that while we'd gotten what we wanted—a world history of glass—querying the author for a little additional detail would get us (and our readers) something more. The revised "Glass" became our touchstone when deciding if an article was right for us, or at least if an article had potential. (It's sheer serendipity—or the synchronicity that world historians often talk about—that this clarity came through "Glass.")

Art in World History

When it came to world history and art, we sought the expertise of Ralph Croizier, who encouraged us to balance and interweave our coverage, logistically organized by area, with cross-cultural contact. "Contact and comparison—the warp and the woof of the new world history," Ralph wrote early in the

planning stage, “not just a Cook’s travelogue of what happened where.” Robert Poor’s “Art—East Asian and European Connections,” for instance, begins when trade brought Chinese silk to Roman weavers, circa 100 CE, and continues through the centuries to examine other East–West connections, such as how two celebrated nineteenth-century Japanese printmakers, Hokusai and Hiroshige, used one-point perspective, a Western technique.

Wilfried Van Damme’s “Art—Paleolithic,” another important addition to the second edition, explains how recent archaeological discoveries in Africa have prompted scholars in a growing number of disciplines to revive their interest in Paleolithic-era art—and thus to open up debate on fundamental world history questions that involve the origins of human art making; the physical, mental, social, and cultural conditions that made it possible; and the fact that creating art has endured and become increasingly integral to our existence. Kathleen I. Kimball, in “Art—World Art Studies,” discusses how the study of objects and technologies humans have made from their earliest days to the present—world art—takes a similar interdisciplinary approach, mining such fields as archaeology, anthropology, art history, and, perhaps surprisingly but significantly, neurobiology.

Ralph’s own contribution, “Art—World History and Art,” addresses the gradual disconnection of visual studies from world history that began in the 1960s (with the growing emphasis of historians on trade, the transfer of technologies, and environmental impacts), and then goes on to raise provocative questions: Is art illustration or content? In world history research, where is the art? If world history has always been undisciplined, Ralph asks—that is to say, not confined within the bounds of normal academic history, but drawing data and ideas from cultural anthropology, the natural sciences, and even economics—is there hope that other these academic

disciplines might bring more visibility to world history? Ralph explains how, at least to some extent, this hope is being fulfilled.

The Environment in World History

As well as being Berkshire’s founder and publisher, I am an environmental author, with titles ranging from the 1989 *Home Ecology* to the recent *Armchair Environmentalist*. One of my priorities has been to publish not only ambitious multivolume works devoted wholly to the environment—the *Berkshire Encyclopedia of Environmental World History* and the *Berkshire Encyclopedia of Sustainability*—but to include environmental topics in all our publications. (Readers can find a discussion of e-waste in *Human–Computer Interaction* and a description of a Seattle library, with a “green roof” designed to reduce rainwater runoff, in *Libraries We Love*). No question then, that in the second edition of *World History* we would expand our coverage of topics that impact the environment, such as deforestation, nuclear power, and population growth, but of environments themselves (often fragile ones), such as Amazonia, Antarctica, Aboriginal Australia, and Oceania. James Lovelock contributed an article on Gaia theory, a major force in understanding the Earth as a living organism “with living and nonliving components existing in concert to create an environment that continues to be suitable for life.” We cover crops that sustain us, such as cereal grains, sweet potato, and manioc, and, in addition to “Domestication, Plant and Animal,” articles about camels, sheep, and goats, creatures vital to the development of civilizations and societies.

Another of our goals in the second edition was to update articles like “Earthquakes” and “Oil Spills” to reflect, as best we could in an encyclopedia format, the natural or human-caused disasters that affect the biosphere. On the brink of going to press, nearly ninety days after the *Deepwater Horizon* explosion,

Scientists measure a dead Kemp's ridley sea turtle on the Gulf Coast of Mississippi. This endangered species is especially at risk in an oil spill because it feeds indiscriminately and has no behavioral mechanism for avoiding oiled waters. National Oceanic and Atmospheric Administration.

the largest crude carriers that will "fit" through the Panama and Suez canals, respectively. Recent requirements and conventions, such as the International Maritime Organization's International Convention for the Prevention of Pollution from Ships, dictate that only double-hulled ships can ply international waters; this should decrease the number of tanker spills in the future, although not all regulations and conventions are legally binding. Oil spill-susceptible single-hulled ships are due to be taken out of service worldwide by 2010, although it remains to be seen whether this will happen or not.

Although the large oil spills receive media attention, only about 4 percent of oil entering the oceans comes from tanker accidents. Another 25 percent enters from tanker operations, 14 percent from other transport accidents, and 34 percent from rivers and estuaries. About 11 percent of the oil entering the oceans comes from natural seeps.

Major Spills

Since 1978 there has been a steady increase in the number of small spills, whereas the number of large

spills has remained relatively constant. One to three spills of over 38 million liters happen each year. One or two catastrophic accidents in any given year can substantially increase the amount of oil spilled onto the land and into the oceans. The small spills of less than 378,000 liters apiece add up to about 38 million liters a year worldwide. Even without major disasters, large quantities of oil spill into marine and inland habitats.

The largest spill on record dumped 907 million liters into the Persian Gulf in 1991 as Iraqi forces sabotaged hundreds of wells, oil terminals, and tankers when they withdrew from their position in Kuwait during the Gulf War, but most spills are smaller. The 1970s were the worst decade on record in terms of both numbers of oil spills and quantities of oil spilled, according to the International Tanker Owners Pollution Federation (ITOPF). Other large spills have included the oil well Ixtoc-1 in Mexico (329 million liters, 1979), Norwester Field in Arabia (302 million liters, 1980), Fergana Valley in Uzbekistan (302 million liters, 1992), *Castillo de Belfor* off South Africa (294 million liters, 1983), and the *Amoco Cadiz* off France (257 million liters,

After the Exxon Valdez spill in Prince William Sound, workers attempted to clean the shoreline using high-pressure, hot-water washes in which oil is heated from the beaches, collected within floating boom, and then skimmed from the surface of the water. National Oceanic and Atmospheric Administration.

1978). All other spills were less than 189 million liters each. The *Exxon Valdez* spill of 1989 in Alaska was twenty-eighth on the list, with 41 million liters, although the spill was particularly devastating because of the fragile nature of the affected sub-Arctic ecosystem. Because the 2010 Gulf of Mexico spill is not yet fully contained at this writing, nearly three months after the explosion of the *Deepwater Horizon* platform—and because the estimates of how much oil spilled per day varied so dramatically, depending on the source—determining its place in this world hierarchy is premature. According to Kayvan Farzaneh, writing in the 30 April 2010 issue of *Foreign Policy*, the Gulf spill would clearly dwarf the *Exxon Valdez* disaster, however, based on average estimates of 5,000 barrels spilled a day for 90 days, or about 75 million liters.

Effects of Oil Spills

Animals and plants and the nonliving parts of ecosystems are not equally vulnerable to oil spills. Some plants are fragile and have narrow habitat ranges, and they grow only in isolated sites. Some animals are very specialized, living in only a few places or eating only a few kinds of foods. Such species are

particularly vulnerable to even small oil spills. Plants and animals in Arctic environments are fragile because of the limited growing season, limited diversity, and slow decay of the oil itself.

Other species are generalists, with wide tolerances for different environmental conditions, broad food requirements, and large geographical distributions. Such animals and plants are very adaptable and often can recover quickly from an oil spill, although the initial death toll may be high. Still other animals, such as some birds, fish, and mammals, can move away from a spill if its spread is slow.

Factors that determine whether an oil spill has devastating effects on plants and animals include size of the spill, type of oil, time of the spill (particularly in relation to the lifecycle of the organisms), vulnerability of particular plants and animals, and the vulnerability of particular ecosystems. Location of a spill can determine effects. In spills in intertidal marshes or estuaries where there is little tidal flow, there is a reduced opportunity for the oil to be carried out to sea, where dilution can blunt the effects. Oil often concentrates at the edge of marshes where there is also a high concentration of invertebrates, young fish, and foraging birds. Many invertebrates

As we prepared to go to press we asked Joanna Burger, the author of "Oils Spills," to update her article to reflect the *Deepwater Horizon* disaster in the Gulf of Mexico and a synchronous oil spill on the other side of the planet, at Dalian, an important coastal resort city in China.

we asked our "Oil Spills" author to add something, quickly, when it was (and is) still uncertain if the leak in the Gulf of Mexico is contained.

Visual Content

The second edition contains more than twelve hundred illustrations, photos, and maps. Of the maps, sixty were drawn specifically for the encyclopedia, and thirty are historical. Each one is significant not just because it reveals an aspect of history, but because it is a part of history itself. Old maps tell us much about how mapmakers and government officials—and the explorers they made the maps for—saw the world and their place in it. For example, the series of maps in the "Africa" article shows how European perceptions of the continent changed over the

years as Europeans experienced more frequent and extensive contact with the land and its people.

Many of the photos in these volumes come from older (eighteenth- and nineteenth-century) sources and, like the old maps, are themselves part of history. As we note in captions to several "period" illustrations, some present highly stylized and romanticized images of other peoples and other places, providing readers with insight, for example, as to how European explorers and colonialists perceived the peoples they encountered in the Americas. We've drawn dozens of new illustrations from sources including the National Archives, the Library of Congress, the New York Public Library, and the World Digital Library. Authors have also provided unique photographs and other illustrative material from their personal collections and from institutional holdings such

An article by Kenneth R. Curtis about Olaudah Equiano, an African writer and abolitionist, includes an historical portrait from the frontispiece of Equiano's autobiography, first published in 1789.

the University of Rhode Island Historic Textile and Costume Collection. The online version and PDFs available for classroom supplementary reading will include the illustrations in full color.

As we nearly doubled our visual content in the second edition, we looked for ways to use images in surprising, illuminating contexts. "Oil Spills," for instance, examines the use of oil throughout history (as well as the natural and human-caused spills resulting from its use). We thought it equally important to select photographs that indicate the damage wreaked by spills in our own time—a picture of an endangered Kemp's ridley sea turtle in the Gulf of Mexico, and another of workers hosing the beach at Prince William Sound (after the *Exxon Valdez* spill) with high-pressure, hot water washes—and images that offer a view of the practical uses of oil

in ancient times. So we chose an image already slotted for another article ("Moses"): Sir Lawrence Alma-Tadema's lavish 1904 biblical depiction, *The Finding of Moses*, in which the pharaoh's daughter and her attendants, traveling in a caravan, carry Moses away from the Nile in his bulrush raft "daubed with pitch." (Pitch, or bitumen, a sticky oil derivative, naturally seeped from mines dug by ancient Mesopotamian peoples, who used it to caulk boats.) Sumerians used pitch as "glue" for jewelry making and mosaics; thus we also included a photo of one of the great treasures excavated from the royal cemetery in the Sumerian city of Ur—a goat "sculpted" from gold, silver, lapis lazuli, copper, and limestone, all held together with bitumen. These examples reveal our abiding interest in providing stimulating visual materials that transport readers across time, space, and cultures.

Judging a Book by Its Cover: The Circle of Learning

We wanted the cover for our encyclopedia of human history to convey the breadth of the human experience over time, not just simply to patch together images from particular times and places. Bill McNeill suggested cave paintings as a possible inspiration. Standing on his porch one day, saying good-bye after a meeting and the lunch he invariably prepares, he said, “Maybe cave art would do it.” He wondered if we could, somehow, use a cave art motif to show the main eras in human history. A tall order indeed, but it inspired the designer, Lisa Clark, to depict a cave wall set against the cosmos—the setting for human history. The images she “painted” on that wall transport us from the foraging era, through agrarianism, and into the modern age.

For the second edition we sought a new look, one that would preserve the original idea of movement, transformation, and connection throughout time, as well as incorporate a circular design element—something we more or less subconsciously adopted in our two latest multivolume publications. For the *Berkshire Encyclopedia of China* we used an open fan; for the *Berkshire Encyclopedia of Sustainability* we chose unfurling fronds of fern. For *World History 2*, Anna Myers superimposed an image of a nautilus shell fossil over Lisa’s first-edition cave art. The result, I believe, reflects Berkshire’s commitment to building circles of learning that are ever-opening but also bound in ways that make them both useful and beautiful.

This commitment does not just apply to Berkshire, of course; it is a shared endeavor, for publishers and librarians, authors and teachers. It is an endeavor

William H. McNeill, holding the first edition of the *Berkshire Encyclopedia of World History*. The new cover for the second edition is in the foreground.

that depends on new forms of networking as well as the best traditions of scholarly information management. It can exist harmoniously with Google and Wikipedia, which are exciting, untamed bazaars full of wonderful things as well as dross. Our job is to create something like the traditional Chinese teahouse of antiquity—a haven of calm within a wild world, a haven where readers and researchers can find sustenance, inspiration, and community.

About William H. McNeill

Editor, *Berkshire Encyclopedia of World History*
(1st and 2nd Editions)

William H. McNeill, a renowned world historian and author of more than twenty books, is the Robert A. Millikan Distinguished Service Professor Emeritus of History at the University of Chicago. In 1996 he was awarded the Erasmus Prize for his contributions to European culture. He is pictured here on 25 February 2010, at ninety-two, receiving a National Humanities Award from President Barack Obama. The text engraved on his medal reads, "Expanding our understanding of the world." Those words could not be more appropriate for McNeill, who has made a lifelong commitment to scholarship (he is the recipient of twenty honorary degrees) and teaching.

After serving in World War II, McNeill received his PhD from Cornell University in 1947. His thesis topic—the potato—reveals both his passion for gardening (McNeill always serves his guests something he's grown himself) and his dedication to research that explores global historical patterns. To explain transformations in the world today, McNeill is fond of pointing out that China is now the largest producer and consumer of a vegetable that originated in the Andes of South America, changed the course of European warfare, and became closely associated with Ireland during the famine of the nineteenth century. Readers of the *Berkshire Encyclopedia of World History*'s second edition will have a chance to

William H. McNeill receiving the National Humanities medal from President Obama in 2010.

absorb the fascinating details about how the “tuber from the Andes” made it to Europe and beyond in McNeill’s article, “Potatoes.”

McNeill is a prolific writer whose work spans a wide range of human interests and accomplishments. His many books include: *The Rise of the West: A History of the Human Community* (9th edition, 1991), which received the National Book Award and the Gordon J. Laing prize; *Plagues and Peoples* (revised edition, 1998); *The Pursuit of Power* (1982); *Keeping Together in Time: Dance & Drill in Human History* (1995); and, with his son, the world historian J. R. McNeill, *The Human Web: A Birdseye View of Human History* (2003). His autobiography, *The Pursuit of Truth*, was published in 2005.

Throughout his career McNeill has served on numerous committees and commissions; he was a

member of the editorial board for the *Encyclopedia Britannica* (1981–1998); the vice chairman of the Christopher Columbus Quincentenary Jubilee Commission (1985–1993); co-chair of the curriculum task force for the National Commission on Social Studies (1987–1989); vice chairman for the National Council for History Standards (1992–1994); and president (1985) of the American History Association. He has written extensively for the *New York Review of Books*.

McNeill lives in Colebrook, Connecticut, in a house his late wife Elizabeth inherited from her family; his large extended family joins him there in the summer and at Christmas. His own story of visiting his grandparents on Prince Edward Island was published as *Summers Long Ago: On Grandfather’s Farm and in Grandmother’s Kitchen*.

QUOTATION CONTRIBUTORS

The following individuals graciously supplied us with quotations that we've used throughout the encyclopedia to enrich the text—most of them are attributed to historical figures, with some drawn from insightful anonymous sources. Thanks especially to David Christian, whose “personal collection” of favorite quotes illuminates myriad perspectives on world history.

Ralph Waldo Emerson once said, “A foolish consistency is the hobgoblin of little minds.” Each time Berkshire Publishing Group sets to work creating an encyclopedia, we review the guidelines that determine how we will present names and terms that have changed in the course of history or through language alterations. We strive for consistency, though not the foolish kind against which Emerson warned.

Languages and geographic terms evolve regularly, and sometimes staying current means that we can’t be completely consistent. Adding to the challenge is the fact that words in languages not based on the Latin alphabet (e.g., Chinese, Japanese, Arabic, Hebrew) must be transliterated—spelled in the language of another alphabet or “romanized” into English. And even within a language, transliteration systems change. Many people who grew up knowing the Wade-Giles system of Chinese romanization (with such spellings as Peking and Mao Tse-tung) had to become accustomed to seeing words using the pinyin romanization system introduced in the 1950s (with new spellings such as Beijing and Mao Zedong).

By and large, we look to *Merriam-Webster’s Collegiate Dictionary, Eleventh Edition* (known as M-W 11), as our spelling authority, with *Merriam-Webster’s Biographical Dictionary* and *Merriam-Webster’s Geographic Dictionary, Third Edition* for terms not in M-W 11. But sometimes we overrule Merriam-Webster for a compelling reason. For example, the historian Ross E. Dunn—who wrote the *Berkshire Encyclopedia of World History’s* article on Ibn Battuta (and who is a leading expert on the

fourteenth-century Arab scholar)—drops the final “h” of M-W’s preferred form, “Battutah.” In another case, the West African town of Timbuktu is so well known by that spelling that we opted for it over M-W’s preferred “Tomboctou.”

Finally, there is the matter of using diacritical marks that indicate other how other languages differentiate among phonetic sounds or meaning: grave (`) and acute (´) accents in French; the stress marks in Spanish that distinguish certain homonyms; the umlaut (¨) and macron (¯) common to several language families; and the apostrophe and reverse apostrophe that stand in for ayn and hamza (the Arabic consonants that have no equivalent in the Latin alphabet)—and that’s just a small sampling. Although English-language typesetting software is beginning to make it easier to convert these diacritical marks from word-processing programs, we continue to use them sparingly in larger publications that include myriad words from numerous languages—while in our small books, such as *This Is China* and *This Is Islam*, we include diacritics for readers who want to become more familiar with a specific language. Herein you will find diacritics used primarily for proper names and terms in which they are most recognizable to English-language readers.

We thought it would be useful (and fun) to provide a listing of the “Top 100” terms—suggested by our editors—that have alternate spellings and names. We’ve also listed pronunciations for non-English names and terms. (The syllable in capital letters is the one to be accented; note, however, that Chinese and other languages do not stress individual syllables.)

Abraham

(2ND MILLENNIUM BCE)

HEBREW PATRIARCH AND LEADER

Abraham plays a foundational role in the scriptures of the three major monotheistic religions (Judaism, Christianity, and Islam) as the first human to become aware of and act out divine will. Symbolic characteristics specific to each text—obedience in the Hebrew Bible, faithfulness in the New Testament, and submissiveness in the Qur'an—have resulted in conflicting theological positions with the potential to impact secular matters of the world.

According to the Hebrew Bible, New Testament, and Qur'an, as well as their respective interpretive literatures, Abraham is the first person to realize and act out the divine will. Although foundational

figures appear in literatures (such as the Gilgamesh epic) that are more ancient than the Hebrew Bible (Old Testament), these have been forgotten to history and only rediscovered through archaeology and the deciphering of dead languages. Abraham first appears in the book of Genesis and serves as the original human to affirm monotheism and to act on that affirmation. The symbolic meaning and significance of Abraham differs among the three great monotheistic religious systems.

Abraham's symbolic importance is first established in Genesis, where in biblical religion he epitomizes obedience to the divine will. He obeys God's commands to leave his ancestral home for a foreign land (Genesis 12), circumcise himself and his male

Guercino, *Abraham Casting Out Hagar and Ishmael* (1657). Oil on canvas. An illustration of Genesis 21, in which Abraham exiles his eldest son. Pinacoteca di Brera, Milan.

offspring as part of God's covenant (Genesis 17), exile his eldest son Ishmael (Genesis 21), and finally, in his greatest act of obedience, raise up Isaac, his only remaining child, as a burnt offering (Genesis 22). In return for his obedience, God promises through the divine covenant to provide Abraham with a multitude of offspring and a land in which his progeny will live.

In the Christian Bible (New Testament), Abraham's significance lies in his unwavering faith. In Romans 4, Abraham's merit is associated less with obedience to the divine will than with his faith in God's ultimate grace. It is his faith that provides him the merit for God's having chosen him for the covenant in the first place, and the covenant becomes one of faith rather than obedience. Members of the divine covenant are, therefore, only those who demonstrate faith in the saving power of Christ (Galatians 4:21–5:1).

In the Qur'an, Abraham signifies human submission (the meaning of the word Islam) to God (2:127–128; 37:103). Abraham rebels against idolatry (37:83–99), fulfills God's commands (2:124), raises and purifies the foundations of God's "House" in Mecca (2:125–132), and establishes his offspring there (13:37). Although the ancient Israelites and Christians and Jews predate the emergence of Islamic monotheism, they did not remain true to the divine covenants (5:12–14) because they refused to submit themselves fully to

God's absolute unity (9:30). Therefore, "Abraham was not a Jew nor a Christian, but was an early monotheist (hanif), one who submits to God's will (muslim), not an idolater" (3:67). Abraham's importance is so firmly established in the foundation narrative of the Hebrew Bible that he cannot be ignored in subsequent Scriptures. Each Scripture, however, imbues a special quality to the person of Abraham and the meaning of his character.

The nature of Abraham's leadership is also depicted with some variety among the three Scriptures. The Abraham of the Hebrew Bible is a literary character with foibles and weaknesses who struggles to realize his role of lonely monotheist in an uncertain and overwhelmingly idolatrous world. When he fears for his own life, he is willing to risk the well-being of Sarah (Genesis 12:12–13; 20:1–11), and he seems on occasion even to question God's promise (Genesis 17:15–18). By the time of the New Testament, however, religious figures have taken on a more consistently righteous character: "When hope seemed hopeless, his faith was such that he

became 'father of many nations,' in agreement with the words which had been spoken to him: 'Thus shall your descendants be.' . . . And that is why Abraham's faith was 'counted to him for righteousness.' Those words were written, not for Abraham's sake alone, but for our sake too: it is to be 'counted' in the same way to us who have faith in the God who raised Jesus our Lord from the dead" (Romans 4:18–24, New English Bible). And by the period of the Qur'anic revelation, the biblical prophets (among whom was counted Abraham) were considered virtually free from error. Thus Abraham, as well as David and Solomon and a host of other characters, are free of all doubt and epitomize a somewhat different prophetic image in the Qur'an. The strength

This sculpted goat, one of the most famous objects excavated from the royal cemetery in the ancient Sumerian city of Ur, is frequently referred to as the "Ram Caught in a Thicket" because the biblical image (from Gen. 22:13, in which Abraham finds a ram to sacrifice in lieu of his son) so aptly fits. The University Museum, Philadelphia, Pennsylvania.

of Abraham's intellect proves the true unity of God (Qur'an 6:74–79), and Abraham never doubts the divine will or God's goodness (Qur'an 37:83–113).

While Abraham's role in world history is, therefore, as the mythic founder of monotheism, he symbolizes three different and often conflicting narratives. The competing and polemical narratives transcend the person of Abraham and bring in the other members of his family, including Sarah, Hagar, Isaac, and Ishmael as well as other scriptural characters and institutions. Not only does each narrative serve to justify a theological position, it also serves as a polemic to argue against the theological and institutional positions of the others. This, in turn, has served to justify and fuel ongoing intellectual, economic, political, and military competition and conflict among the three monotheistic religions in history.

Absolutism

Though extremely widespread in seventeenth-century Europe, absolutism existed elsewhere as early as 1500, when monarchs who were uncomfortable with too much political, religious, and social unrest aimed to pacify their subjects by claiming their divine right to the crown. Compared to modern totalitarian dictators, however, who have sophisticated means of surveillance and propaganda, absolute rulers were far less powerful.

European absolutism grew out of a need for order in the face of political and religious polarization. Absolute kings in Europe identified sectarian dissidents and aristocratic landowners as the primary culprits behind civil wars. They moved to confront these alleged villains by claiming to rule by divine right, insisting upon religious uniformity, constructing large civilian and military bureaucracies accountable only to the Crown, turning the nobility into dependent window dressing with much social but far less political power, and by exacting high excise taxes that failed to cover the escalating costs of bureaucratic spending and the social round at court. Absolutism was not unique to seventeenth-century Europe; absolute kings ruled in China, India, western Africa, the Ottoman Empire, Safavid Persia, and Tokugawa Japan between 1500 and 1800. Indeed, in Europe itself, the origins of absolutism appeared when kings in England and France tried to increase their power against feudal lords and the Church between the eleventh and fourteenth centuries. These foundations began to strengthen when the “new monarchs” of Western Europe tried to stabilize and professionalize their governments in the spirit of the

Renaissance. The Protestant Reformation both weakened and strengthened this tendency toward royal centralization. It unleashed popular discontent with traditional authorities (including those kings who did not share the reformers’ zeal), but it also confirmed the Erastian notion of the monarch, not the pope, deciding the spiritual matters of countries, even in those places that remained Catholic. Absolutism in seventeenth-century Europe was just the latest and most self-conscious effort in a long push to make the king supreme in both spiritual and, thus, temporal policy.

Divine Right and Religious Intolerance

By claiming to rule only by the grace of God, rulers gained credibility and confidence. For example, Louis XIV of France (1638–1715) overcame the treacherous Fronde (the civil war lasting from 1648 to 1653) of his childhood by invoking divine justification for leading without either the Estates-General or ecclesiastical surrogates. After his final accession as sole ruler in 1661, he became known as the Sun King, from whom all energy and power came. His rays extended to the provinces, where intendants carried out his wishes without his physical presence. Even after a long reign ending with disastrous wars and famines in the early 1700s, Louis still demanded and largely commanded universal respect because of the conventional belief in God’s will behind his blunders and whims. It would take the corrosive critical thinking of the Enlightenment, beginning with the next generation, to undermine slowly the passive obedience necessary for unenlightened absolutism to work. From a global perspective, however, Louis

was neither original nor excessive in his claims for divine inspiration. A century before, Süleyman the Great of the Ottoman Empire had claimed that his deity Allah anointed him as the direct deputy, or caliph, of Muhammad, the prophet of his faith. A contemporary of Louis XIV, the Emperor Kangxi of China continued the age-old tradition of receiving the “mandate from heaven,” even though he was a Manchu outsider. The emperors of Benin and Dahomey wore shoes that stood very high above the ground so as not to dirty their semidivine feet with common earth. Their god or gods all insisted, according to the monarchs, that their way was the best way for their people to worship.

By insisting upon religious uniformity, rulers hoped to pacify through codified intolerance, a strategy used more often in Europe than elsewhere. In particular, Louis XIV revoked the Edict of Nantes in 1685, exiling his Huguenot, or French Protestant, minority in the process. His grandfather Henry IV had issued the Edict in 1598, hoping to end thirty years of civil war by granting Huguenots limited autonomy in a largely Catholic France. Louis saw the Huguenots, however prosperous and assimilated, as a threat to national security largely because he saw them as a fifth column sharing the same faith as his Dutch and English rivals. To Protestants in England and Holland, Catholicism became intrinsically linked to absolutism. Yet Protestant monarchs claiming to be absolute in the German states and in Sweden could be just as insistent on their religion being the only religion of their people. In contrast, sixteenth-century Muslim rulers had tried religious tolerance as a cornerstone of their leadership. In Ottoman Turkey, Süleyman continued the early Islamic tolerance of monotheistic faiths such as Christianity and Judaism. Akbar the Great of Mughal India, a Muslim, tried to build bridges to his Hindu majority by trying to merge the two religions. This trend did not last, however. By the time Louis XIV came to power in France, later Ottomans were far more suspicious of their Christian subjects. Akbar’s great-grandson Aurangzeb, furthermore, viewed his merger as blasphemy and emphasized Islamic superiority, which

doomed his dynasty before opportunistic British and French adventurers. Of all the absolute monarchs, the most tolerant and most successful outside of Europe was Kangxi of China, but even he drew the line on ethnocentric emissaries from the Pope.

Bureaucratic Rule

To ensure religious uniformity and thus national security, monarchs needed professionals whom they could control and trust. By constructing large civilian and military bureaucracies accountable only to the Crown, rulers relied on loyal experts rather than on fickle vassals. For example, Frederick William of Prussia based his autocracy upon bureaucracy. Prussian armies and officials became synonymous with disciplined and reliable efficiency. Similarly, Peter the Great of Russia defeated Swedish and Ottoman adversaries by using uniformed soldiers paid by him rather than by individual boyars. From Spain through Austria to Sweden, agencies censored, and spies opened letters, in part to stay on the royal payroll. This feature of absolutism again was not unique to Europe. The Qing drew upon entrenched Confucian values of scholar-bureaucrats as heroes to combat the indigenous gentry. The Ottomans continued long-held Byzantine traditions of big government to rule their diverse dominions.

By turning the nobility into decorative dependents with much social but far less political power, monarchs became the major providers of patronage and hospitality at artificially ostentatious capital cities. Bureaucrats who could be fired did most of the work of local and central government by 1700, allowing aristocrats who could not be fired even more leisure time. Louis XIV’s Versailles provided the most notorious backdrops for elite partying, all done at taxpayers’ expense. At Versailles, nobles who had once fought over provinces now fought over who would attend the king’s next soiree. From Madrid to Vienna to Saint Petersburg, baroque and rococo palaces underscored the wealth and majesty of their monarchs. Indeed, Peter the Great created Saint Petersburg in 1703 as his answer to the pomp and theater of Versailles,

announcing to the world that Russia was an absolutist European state with a gilded window to the West. Of course, the burden for funding this largesse fell hardest upon the poor with regressive tariffs and sales taxes. In France especially, nobles and clergy were exempted from most taxes, largely to gain their loyalty and their indifference to royal spendthrifts. From a global perspective, however, the most put-upon taxpayers living in an absolute state lived in Tokugawa Japan, where peasants paid almost one-half their incomes in taxes.

Monarchs limited the wealth of their nations by raising taxes on the poor to pay for the loyalty and comfort of the well connected. This was acutely true of the European variety of absolutism. Louis XIV left France destitute, despite the fact that it was the most populous country in Europe. His legacy of national indebtedness would grow into the nightmare that set the stage for the Revolution. Under the mercantilism of the financier and statesman Jean-Baptiste Colbert, wealth was supposed to trickle down through the Sun King and his favored monopolies, particularly a domestic silk industry, to the common people. Unfortunately for him and his realm, Louis was as bad a businessman as he was a commander in chief. His protected industries were not protected from royal graft and bureaucratic inertia; they were no match globally against more entrepreneurial English and Dutch freelancers. Adam Smith's caricature of mercantilists as craven incompetents was not far from the truth.

Limited Monarchies in the Seventeenth Century

At least three of the major exceptions to absolutist rule in Europe prospered largely because their rulers still had more limited executive power. While Poland did not last long because it lacked a strong central government and was partitioned into extinction by absolute monarchies by 1795, the Dutch Republic, England, and Scotland prided themselves on being both Protestant and relatively

free of absolutism. After winning its long struggle for independence against Habsburg Spain in 1648, the Dutch Republic generated wealth that was put back into business and not back into a voracious, bloated bureaucracy. The kings of England and Scotland tried to become absolute during the seventeenth century, but their attempts failed, with one king beheaded in 1649 and one of his sons essentially fired by Parliament in 1688. England and Scotland then imported a Dutch king, William of Orange, to rule under limits, issuing the Bill of Rights of 1689. When Britain (the union of England and Scotland after 1707) economically eclipsed the Dutch Republic in the eighteenth century, the British used Dutch ideas about banking, insurance, and stock exchanges, all of which were slow to be reproduced in absolute monarchies such as Austria, Prussia, and France.

Absolutism and the Enlightenment

While more stodgy and less dynamic than their Dutch and British counterparts, absolute monarchies in most other parts of Europe did not remain static during the second half of the eighteenth century. This partial makeover was in contrast to Muslim and Chinese contemporaries who clung much more closely to hidebound tradition. Most significantly, enlightened absolutism in Europe recast the kings as devotees of the *philosophes*. Frederick the Great of Prussia, the son of Frederick William, learned from Voltaire to make his bureaucracy even more professional and less arbitrary than his martinet father. His government allowed some expressive freedoms and used fewer tortures, all in the spirit of the Age of Reason. He forced his people to adopt more rational ways of farming, even making them cultivate the American potato over traditional favorites. Nevertheless, Frederick's devotion to reform was selective at best. He kept his own serfs despite rhetorical objections to the idea of serfdom, and he reserved bureaucratic positions and their accompanying privileges for the Junkers, the Prussian aristocratic landowners.

All parties without exception, when they seek for power, are varieties of absolutism. • **Pierre Joseph Proudhon (1809–1865)**

Catherine the Great of Russia was even more timid in her pursuit of change. While she seemed to patronize the activities and agree with the intentions of the Enlightenment, she expanded serfdom into newly acquired territories and dropped all taxes on the nobility entirely in 1785. Other monarchs went much further than Frederick and Catherine in their embrace of directed progress for all of their people. Adhering to the Enlightenment's economic views, Charles III of Spain encouraged free trade within his empire with his famous decrees of 1778 and 1789. He also ended the practice of selling high offices to the highest bidder, making his colonial bureaucracy more accountable and, unfortunately for his successors, more resented. Religious freedom under the Bourbon reforms paradoxically required a degree of religious intolerance: Jesuits were now seen as retrograde obstacles to progress rather than as purveyors of absolutist civilization and were expelled from the Spanish Empire in 1767. While Jesuits were also expelled from the Portuguese Empire in the name of enlightened despotism in 1759, Joseph II of Austria abolished discriminatory measures against Protestants and Jews in the 1780s without expelling the Jesuits. He even abolished serfdom in 1781 by royal edict.

Absolutism and Totalitarianism

Absolutism, however enlightened, should not be confused with modern totalitarianism. Absolute kings were far less powerful than modern dictators. Technologies of surveillance and propaganda used by Adolf Hitler, Joseph Stalin, and Idi Amin were unavailable to Louis XIV, Frederick William, and Kangxi. Absolute monarchs claimed sovereignty from God, while totalitarian dictators claimed sovereignty from a majority of their people. The French Revolution's most radical phase introduced a more efficient form of centralization. The most effective of

the enlightened despots, Napoleon, acted as a transition between the two types, judiciously choosing the people as a more solid and credible foundation for power than God.

Adolescence

The time of life known in Western culture as adolescence, the transitional stage between childhood and adulthood, is associated with the set of physical, emotional, and motivational changes brought on by puberty. While the stage exists in every society, the duration and degree of upheaval it causes for a child of a given culture depend upon the context in which child is raised.

The term *adolescence* refers to both a chronological stage in the human life cycle and a psychological and behavioral profile understood to uniquely describe a specific category of people. Chronologically, adolescence is the transitional stage between childhood and adulthood. Psychologically and behaviorally, adolescence is a time of life characterized by emotional upheaval, risk taking, rule breaking, increased conflict with parents, uncertainty about self-identity, and heightened interest in romantic attachments and sexual activity. Although all known societies, past and present, distinguish among children, adults, and old people, adolescence is not universally acknowledged as a separate stage in the life cycle of a person. The term *adolescence* as used to indicate youthfulness seems to have appeared in the English language only at the end of the nineteenth century, and the idea of adolescence as a special developmental stage did not surface formally in Western culture until the twentieth century.

Adolescence as a distinct stage of development also appears to be absent in certain non-Western societies. Among the Cubeo people of the northwestern Amazon in South America, for example, puberty signals

the arrival of adulthood, and no distinct adolescent stage is recognized. The Cree Native Americans distinguish only between adults and nonadults; a male child is a “small man” and a female child a “small woman.” Even when a society reserves a special status for the pubescent boy or girl, the chronological age span may not overlap the familiar definition of adolescence. Thus, among the North American Chipewewa people, puberty was understood to signal the beginning of a special stage of life, but that stage lasted until a person had grandchildren. Nevertheless, a stage in the life cycle comparable to adolescence is extremely common across time and geography. Virtually all in a sample of 186 cultures around the world recognize some kind of transition period between childhood and adulthood. What most differentiates adolescence across societies is the duration of the adolescent transition and the degree of upheaval experienced by the young person. The almost universal presence of adolescence across time and geography is attributable to certain universal features of human development. Variations that occur in the duration and quality of the adolescent transition are accounted for by differences in the context in which children are raised, which influence how the universal aspects of adolescence are played out in particular cases.

Universal Aspects of Adolescence

As a chronological stage of life, adolescence roughly coincides with puberty. Puberty is a complex set of physiological processes that results in physical, emotional, and motivational changes in a person. These changes include maturation of the reproductive system and associated increased interest in the

opposite sex and parenting, along with maturation of secondary sex characteristics such as body size, body shape, and patterns of hair growth. All of these changes are precipitated by the activity of several hormonal systems. Puberty is also associated with maturation of certain brain functions that then affect the motivational and emotional profile of the young person. Brain changes specifically related to puberty underlie some of the psychological and behavioral traits that we associate with adolescence, including increased emotionality, a thirst for adventure and novelty, antisocial behavior, and increased conflict with parents.

Because puberty is a universal feature of the human condition, all teenagers can be expected to manifest to at least some degree the expected physical, motivational, and behavioral outcomes produced by hormonal and brain changes associated with puberty.

Developmental psychologists have also long noted that pubertal changes are likely to create secondary effects that, because they are the result of the universal process of puberty, can also be expected to be universal. The first of these effects concerns how young people undergoing puberty now view themselves. The assumption is that puberty inevitably requires a new self-definition in light of the dramatic physical and motivational changes that the adolescent is experiencing and that this identity revision must result in some amount of internal emotional upheaval. The equally inevitable fact that adolescents are now in a position to demand more power and more privileges can be predicted to create certain universal tensions between teenagers and their elders. With regard to the society at large, the senior generation is likely to resist surrendering its authority to the younger generation. Regardless of time or place, conflict between parents and adolescents can be expected to escalate as teenagers become less dependent on parents and increasingly capable of challenging parental authority.

Although the universal process of puberty may inevitably produce certain outcomes regardless of historical time or place, variations in the environmental context in which the adolescent lives can affect

how adolescence is played out. Such variations can increase or decrease the degree to which emotional upheaval and interpersonal tensions will characterize the adolescent experience.

Managing the Adolescent Identity Redefinition

Many societies historically have responded to the inevitable fact of puberty by instituting initiation ceremonies of some sort that publicly recognize the changing status of maturing youth. For boys such ceremonies may include public circumcision as well as hazing and other psychological and physical challenges. For girls such ceremonies are often associated with menarche, the onset of menstruation. Often a ceremonial rite culminates in an explicit ceremony conferring adult status on the initiate. Initiation ceremonies, then, represent a public recognition that the young person is maturing physically and can be expected to begin to engage in adult behaviors. As such, initiation ceremonies provide community support for the adolescent's attempts at redefinition of self and publicly confirm that the adolescent is becoming an adult. The upheaval associated with image redefinition in such societies is likely to be relatively mild.

Initiation ceremonies have become less common or have been stripped of much of their original meaning in contemporary cultures, especially in complex heterogeneous societies. When no public recognition of the fact and implications of puberty is given, adolescents are left to struggle through the adolescent identity shift on their own, with the result that the shift may be prolonged and difficult. It is probably not a coincidence that the view of adolescence as a period of storm and stress, as well as the concept of the identity crisis, originated in Western culture, which lacks meaningful initiation ceremonies. In Western culture ceremonies such as the bar mitzvah (the initiatory ceremony recognizing a boy as having reached the age of Jewish religious duty and responsibility) may still be practiced, but these ceremonies no longer guarantee that the young person will now be recognized as a man, the original culmination of the ceremony.

Range of Life Choices

The adolescent experience is also affected by the range of choices open to people who are facing adulthood and need to make decisions about the course that their lives will take. The wider the range of choices, the more difficult it can be to negotiate the task of taking on new roles, and the more the need to choose will be associated with upheaval. Theoretically, important choices that a young person might need to make upon reaching adulthood include whether or not to marry, whom to marry, whether to have children, what career path to follow, what political and religious beliefs to adopt, and where to live. In practice, any or all of these choices may be foreclosed to the person, either by circumstance or by cultural convention. Historically, because of limitations on the availability of potential spouses, absence of effective birth control technology, hardships associated with making a living, and cultural barriers foreclosing free choice of spouse, job, and the like, a young person typically had fewer choices to make regarding how his or her life would look. In contemporary heterogeneous, democratic, affluent societies, the choices that a young person can and indeed *must* make are numerous, the consequences of making such choices are momentous, and pressure to make a number of decisions about the future simultaneously is often present. Hence, the level of stress experienced during adolescence, and beyond, is expected to be higher in such societies. This difference in the constraints placed by custom and circumstance on individual life choices may explain why, until the close of the Middle Ages, the distinction between child and adult was minimized, not to mention the recognition of adolescence as a separate stage of life.

Continuities between Childhood and Adulthood

A society can either emphasize or de-emphasize the differences between childhood and adulthood in such areas as taking responsibility, participating in sexual activity, being exposed to death, and so

The thirst for adventure and novelty is one trait associated with adolescence. Young people at a fair in India enjoy riding and powering a Ferris wheel.
Photo by Klaus Klostermaier.

on. When a society emphasizes continuities, or in other words de-emphasizes differences, the transition from childhood to adulthood is more likely to be short and smooth. To the extent that expectations for and the practical experience of the adolescent are dramatically different from childhood to adulthood, the transition from the one stage to the other has the potential to be long and difficult. Historically, children were incorporated into adult life at an early age, and the same often holds true in contemporary traditional societies with a subsistence economy. Children in societies of this sort take on responsibility when they are quite young, in degrees consistent with their age and capabilities, and may be making concrete and important contributions to the welfare of their

families at a quite early age. Historically, children were exposed regularly to the facts of life, including sex and death, and this exposure is also the case in many traditional cultures around the world. In many cultures teenagers are already living a fully adult life. In 52 percent of a worldwide sample of fifty-eight cultures, boys are already married by nineteen years of age, and in 96 percent of sixty-nine cultures around the world, girls are married before they are twenty. With marriage come all of the responsibilities as well as the privileges of adulthood, and whatever adolescent transition that these young people have experienced is over.

Clarity of Expectations

Related to the range of choices open to the adolescent is the clarity with which expectations regarding the behavior of the adolescent are laid out by the older generation. In many societies stages in the life cycle are associated with age grades. Each age grade is composed of people of a specified age range. A given age grade is associated with a detailed set of responsibilities and prerogatives. Explicit procedures guarantee graduation from one age grade to the next. When age grades are present in a society, adolescents usually belong to their own age grade. This fact means that adolescents know what is expected of them. It also means that adolescents understand how and when the transition out of adolescence and into adulthood will happen.

Clarity of expectations, with regard to what the adolescent must and must not do and with regard to how and when adult status will be granted, makes for a smoother and less tumultuous adolescent experience. In societies with no such clarity of expectations, adolescents, left on their own to construct their own adolescence and make their own entry into adulthood, tend to have a more unsettled adolescent experience. Societies that leave adolescents to fend for themselves may have no choice, at least as regards some features of adolescents' life. For instance, where the range of choices open to adolescents is wide, and where a society is constantly changing over time, the older

generation cannot predict what adolescents need to know or do to prepare for adulthood. The trade-off for adolescent stress is opportunity in adulthood.

Historical Variations in the Timing of Puberty

The major physical and psychological changes associated with puberty occur during the second decade of human life regardless of historical time or place. But within these temporal boundaries, the environment in which a child is raised can affect the details of the onset and timing of puberty. Thus, since about the 1870s, the age of onset of puberty has been decreasing by approximately four months each decade in some western European nations. This trend also began to appear in other countries across the world in the mid-twentieth century. The decline in the age of onset of puberty through recent historical time, known as the "secular trend," has been accompanied by a more rapid pace of pubertal change. Age of menarche and attainment of adult status reflect this pattern. Thus, in urban populations, where the secular trend is most evident, menarche occurs on average at the age of twelve, whereas in Papua New Guinea, where the secular trend is not in evidence, menarche does not occur until a girl is eighteen years old. The secular trend affects growth patterns in a similar way. In the United States, where the age of onset of puberty has been decreasing steadily for decades, girls reach their adult height at an average of thirteen, whereas U.S. boys reach their adult height at an average of fifteen and a half. By contrast, among the Kikuyu people of eastern Africa, where puberty begins later, girls attain their adult height during their late teens on average and boys during their early twenties. Differences in the age of onset and duration of puberty coincide with differences in the standard of living of a population. In particular, decreases in a child's level of exposure to disease, increased quality of nutrition, and improved health of the mother during pregnancy seem to be causes of the secular trend.

The secular trend has important implications for the adolescent experience for a number of reasons.

At sixteen I was stupid, confused and indecisive. At twenty-five I was wise, self-confident, prepossessing and assertive. At forty-five, I am stupid, confused, insecure and indecisive. Who would have supposed that maturity is only a short break in adolescence? • **Jules Feiffer (b. 1929)**

Obviously earlier onset of puberty will mean earlier expression of the psychological and behavioral traits associated with adolescence. Less obviously, when onset of puberty is accelerated as rapidly as it is by the secular trend, a society's expectations about its young people may not be keeping up with biological reality. If young people who are physically, sexually, and psychologically precocious in comparison with the same age cohort of just a generation ago are treated as if they were children, both the young people and the society will experience disruptions.

The secular trend has another far-reaching effect on the adolescent and the community. Hormonal and brain changes associated with puberty account for some, but not all, of the maturation of a person during and after the teen years. Cognitive skills such as the ability to plan, to control impulses, and to appreciate the long-term consequences of one's actions also become more sophisticated with age but develop independently of the hormonal and brain changes associated with puberty per se. Thus, there is dissociation between the maturation of physiological and motivational changes common to puberty and the development of cognitive skills that allows for thoughtful, disciplined, forward-looking planning. Acceleration of puberty does not lead to earlier maturation of cognitive skills, which, therefore, lag further and further behind with the earlier and earlier onset and faster and faster rate of puberty. Before the secular trend, the tendency of sexually mature adolescents

to act on impulse, take risks, break rules, and seek novelty was more likely to be offset by an increasing capacity to think clearly about the meaning and consequences of their actions. With the appearance of the secular trend, adolescents are able and willing to behave in ways that can have harmful, even tragic, consequences but do not always have the cognitive resources to inhibit such behavior. Historically, we seem to be witnessing a growing disconnect between what actions adolescents want to take and can take and how adolescents reason about those actions.

Africa

Africa's contentious role in world history has varied with the perspectives of those writing it; the Eurocentric views place Africa in a minor, isolated role, while the Afrocentric view credits black civilization in Egypt with many cultural advances. African studies since the 1950s have provided new insight to the history of the continent, often stressing its interrelatedness to other continents and regions.

Africa has played a number of often contradictory roles in the writing of world history. Indeed, perhaps no single world region has played so contentious a role in the field. Africa has been derided by some scholars as irrelevant to world history. Conversely, others have argued that Africa lies at the very center of human history. The latter perspective is largely attributable to the widespread recognition in paleoanthropology that, based on archeological and anthropological evidence, such as fossil finds in the Awash Valley in Ethiopia, the human species originated in Africa and migrated from there to the rest of world. What could possibly account for such utterly incompatible perspectives? The answer to the question is itself historical. Over the past several hundred years, the history of Africa has been viewed through a variety of lenses, and these lenses have greatly influenced the way the history of Africa has been understood. Similarly, as the range of academic thinking has expanded and diversified in recent years, so have the number of lenses for understanding Africa. Rather than seeing the various contradictory notions of Africa as a failing of history, however, it might be more useful to look at the situation as instructive. By examining the great variety of ways in which Africa has been

understood in the past few hundred years, we gain a remarkable insight into not only the complex part of the world known as Africa, but also into the growth and development of the field of world history itself.

Origins of the Name Africa

The very origin of the name *Africa* is contentious. The most common scholarly explanation is that it comes from the Roman *Africa terra*, or “land of the *Afri*” in reference to a Berber-speaking society that once lived in what is now Tunisia. One alternative explanation is that it comes from the Latin *aprica* (sunny) or the Phoenician term *afar* (dust). An Arabic term, *Ifriqiya*, is often assumed to come from the Roman, though some argue that the Latin term came from the Arabic. There is also an Afrocentric argument that the term is actually ancient Egyptian in origin, from *Af-Rui-Ka*, meaning “place of beginnings.” Whatever the origins of the term, by the fifteenth century *Africa* was winning out against competing terms such as *Ethiopia* and *Libya* to become the common identifier for the continent. Looking at maps of Africa produced during the fifteenth through seventeenth centuries, *Africa* increasingly comes to dominate as the name of the continent. The controversy over the landmass's name foreshadows the deeper conflicts over its meaning and relevance in world history.

Early Conceptions of Africa

The field of history as we know it today is largely a Western creation. It should be no surprise, then, that the earliest attempts at writing histories of the world are themselves European. Particularly during

African nationalism is meaningless, dangerous, anachronistic, if it is not, at the same time, pan-Africanism. • **Julius K. Nyerere (1922–1999)**

This early-twentieth-century book illustration superimposes the “shapes” of four other regions on a map of Africa to demonstrate the continent’s vast area.

the Enlightenment, European philosopher-scholars were trying to make sense of a world that was to them very new. European voyages of exploration and colonial expansion had resulted in a great deluge of information about the wider world, and these early scholars struggled to pull the information together into a whole that explained the world as they were experiencing it. Thus, just as new cartographic skills were creating an increasingly detailed picture of physical Africa, these scholars sought to create an explanation of Africa’s place in world history.

Notably, prior to the modern era, Africa was not seen as a terribly different part of the world. Given the long interaction among Europe, Africa, and the Middle East, all had previously been seen as part of a single world, as is evident from premodern maps. Indeed, trade, the Roman Empire, and then Christianity

had helped create a high degree of shared culture and identity in the circum-Mediterranean region, such that Africa was probably seen as more a part of the Roman Christian world than were many parts of northern and eastern Europe. This legacy survived even the collapse of Rome and the rise of Islam, for example in the myth of Prester John, a supposed Christian king sometimes placed in distant parts of Asia and sometimes in Africa. For a very long time, then, Europeans often saw Africans in terms of similarity and affinity, not difference. Early Islamic travelers and scholars, too, while initially seeing the Dar al-Sudan (land of the blacks) as a very different place, increasingly came to accept regions of it as part of the Dar al-Islam (land of peace).

Racial and Civilizational Views of Africa

In their efforts to place Africa in world history, most Enlightenment historians were deeply influenced by two issues. First, they tended to think of historical evidence only in terms of written documents. Thus, because they were either unable to translate (as in the case of ancient Egyptian, until the deciphering of the Rosetta Stone in the early nineteenth century) or unaware of written documents of African origin, these scholars decided that Africans were without history. Second, and perhaps more importantly, they were deeply influenced by growing notions of European racial superiority. Born of the achievements of the scientific revolution and the creation of a new plantation economy that demanded a brutal system of slave labor, most European scholars of the time embraced the notion that nonwhite peoples were intrinsically inferior. Witness the following excerpt from David Hume’s essay “Of National Characters” (1748):

I am apt to suspect the negroes and in general all other species of men to be naturally inferior to the whites. There never was a civilized nation of any other complexion than white, nor even any individual eminent either in action or speculation. No ingenious manufactures amongst them, no arts, no sciences.

AFRICA IN HOMER'S WORLD.

This map and the ones to follow illustrate how European knowledge of Africa evolved from Homer's day to the sixteenth century.

G. W. F. Hegel's "Geographical Basis of World History" (1820s) reflected similar themes. Hegel divided Africa up into three regions: North Africa, Egypt, and "Africa proper." Hegel describes the region thus:

Africa proper is the characteristic part of the whole continent as such . . . It has no historical interest of its own, for we find its inhabitants living in barbarism and savagery in a land which has not furnished them with any integral ingredient of culture. From the earliest historical times, Africa has remained cut off from all contacts with the rest of the world; it is the land of gold, forever pressing in upon itself, and the land of childhood, removed from the light of self-conscious history and wrapped in the dark mantle of night.

CENTRAL AFRICA
according to
EDRISI. 1154 A.D.AFRICA IN MAP OF HEKATÆUS.
500 B.C.

Hegel's characterization of Africa in world history includes several key elements that continued to be used to define Africa (and Africans) in world history for more than a hundred years. First is the racial division of Africa. North Africa and Egypt, where people were "less black," were judged to possess history, while black Africans were devalued as uncivilized, living in barbarism, and devoid of culture. Second, "Africa proper" was described as being isolated from other parts of the world and thus peripheral to world history. Third, Africans were defined as childlike—not fully mature (as opposed to Europeans). Such a characterization was a critical element in the paternalistic justification of European authority, first in the context of slavery and later in the imposition of colonial rule.

During the course of the early twentieth century, a somewhat different twist on the racial model of world history became prominent, and this was the notion of civilizations. Historians of this era, such as H. G. Wells, Arnold Toynbee, and James Breasted, built their

MAP OF THE MARGARITA PHILOSOPHICA
A.D. 1503

HIPPARCHUS.
100 B.C.

analysis and presentation of world history around the presumed racial and cultural continuity of certain civilizations. Not surprisingly, these scholars placed European civilization at the pinnacle of a human hierarchy, with other civilizations, such as Chinese or Persian, playing at best supporting roles. Like the Enlightenment historians before them, these scholars left Africa out of the picture, owing both to African's presumed uncivilized nature and the absence of historical documentation. In the 1937 edition of his *The Conquest of Civilization* Breasted (1937, 44–45) dismissed Africa as separated from the “Great White Race” by the Sahara and therefore uninfluenced by civilization:

On the south of the Northwest Quadrant lay the teeming black world of Africa, as it does today. It was separated from the white race by the broad stretch of the Sahara Desert. Sometimes the blacks of inner Africa did wander along [the Nile] into Egypt, but they only came in small groups. Thus cut off by the desert barrier and living by themselves, they remained uninfluenced by civilization by the north, nor did they contribute appreciably to this civilization.

Thus the civilizational model did not so much displace race as a means of defining world history as incorporate it into a larger framework. Race and civilization came to mean much the same thing, and, as before, Africa and Africans played a role in world history only as the uncivilized foil to Europe's achievement and sophistication.

PTOLEMY'S MAP. A.D. 150.

Early Twentieth-Century Black Scholarship

The twentieth century, however, witnessed a number of challenges to the concepts of whiteness and civilization that had been constructed by earlier world historians. The first of these challenges came from a group of African-American scholars that included such pioneers as Carter G. Woodson and W. E. B. Du Bois. Both held PhDs from Harvard University and published extensively on black history. Woodson, for example, helped found the *Journal of Negro History*. Du Bois, one of the most prolific writers of the age, directly challenged the notion of Western cultural primacy with such essays as “What is Civilization” (1926). Both scholars did much to undermine the notion that Africans were without history.

Also of early significance was the Senegalese scientist and historian Cheikh Anta Diop, whose doctoral dissertation at the Sorbonne created a sensation in the 1950s by arguing that the ancient Egyptians had been black, rather than white. Diop's work became a foundational element of the Afrocentric perspective on Africa, which argues that there was a coherent black civilization that had its roots in ancient Egypt. Afrocentrism has increasingly come to represent a counterpoint to Eurocentrism. Indeed, other Afrocentric scholars, such as George James, have even carried the argument further, making the case in *Stolen Legacy* (1954) that ancient Greek culture, rather than being a local innovation, was stolen from Egyptian culture. The argument over the relationship (or lack

JOHN RUYSCH
AD. 1508.

thereof) between Greece and Egypt continues to be a contentious one to this day. Witness, for example, the extensive debate between Martin Bernal (author of *Black Athena*) and Mary Lefkowitz (author of *Not Out of Africa: How Afrocentrism Became an Excuse to Teach Myth as History*). Notably, while the Afrocentric perspective has helped to undermine notions of white superiority, it has not made a break with, but rather has embraced, an overtly racial notion of historical analysis. Indeed, more extreme exponents of Afrocentrism have argued that only those of African descent can truly understand, and hence study, African history. In the world of scholars who increasingly sees race as a social construct, such essentialist frameworks have become less and less popular.

The Rise of Area Studies

In the 1950s, the rise of area studies programs helped to further undermine the old Eurocentric models of world history. In the United States, the creation of a number of government-subsidized African studies programs provided an institutional foundation for a systematic study of African history. During the 1950s and 1960s a new generation of Africanists in Africa, the United States, and Europe helped develop an interdisciplinary historical

SYLVANNUS' MAP
A.D. 1511

methodology that embraced not only written documents, but also oral histories, linguistics, and archaeology as a means of reconstructing the African past. Over the decades since, the results of this research have established a rich and varied historiography. Such a body of historical knowledge could not be ignored by world historians, and as a result world history texts could no longer discount Africa as being without history.

But the area studies model was not without its drawbacks. In particular, the organization of different parts of the world into apparently coherent areas (largely based upon continental divisions) ascribed a meaning to units no more precise than the older concepts of race or civilization. Notably, world history textbooks followed the new structure of the field by basing their chapter organization on area studies frameworks, leading to a “meanwhile, in Africa” approach to the continent. Such a framework did little to undermine the old notion of an isolated Africa or of the idea of culturally coherent civilizations that had previously been advocated by

**HIERONIMUS DE VERRAZANO
1529**

**SEBASTIAN CABOT'S MAP OF THE WORLD
16th Century**

the likes of Hegel and Breasted, or even Diop. The 1980s and 1990s saw a challenge to these notions via the rise of concepts such as zones of interaction, which stressed the connections between regions rather than the difference between them. Regions such as “the Atlantic world” or “the Indian Ocean world” replaced continents as units of analysis. As Patrick Manning, one of a growing group of Africanists who have greatly influenced world history in recent years, argued in his 2003 work *Navigating World History*, it is the connections that make world history, not the separations.

Because these new regional units of analysis build on zones of interaction rather than on continents or civilizations, they threaten to deconstruct the very area studies frameworks that have done so much to further the history of Africa and other previously neglected regions of the world. The point here is that the changing “concepts” of Africa highlight that the concept of Africa itself is a construction, no less than that of race or civilization. The meaning of Africa, thus, has held different things for different audiences over time. Some based more in historical fact, and others based more in cultural and political agendas, perhaps, but all very real in terms of the impact on their audience’s conceptions of world history. The changing notions of

Africa highlight the fact that our understanding of both Africa and the world has been both interrelated and constantly changing for the past several hundred years. Indeed, it is rather difficult to understand the one without the other.

Africa—Colonial

When technological advances made Africa's interior readily accessible in the late nineteenth century, the nations of Europe raced to colonize the continent. Colonial administrations enticed or coerced Africans into producing goods for export, until native conscripts brought home the concept of "freedom" from World War II. The late twentieth century saw the end of colonial rule in Africa, yet its effects remain.

The colonial era in African history was relatively brief, but it was decisive in shaping Africa's relationship with the twentieth-century world. The legacies of colonialism are still felt broadly and deeply across the continent.

Creating a Colonial Order, 1880 to 1914

Until late in the nineteenth century, almost all European interaction with Africa took place along the coasts. An exception to this was the area around the Dutch settlement of Cape Town, where a frontier of European settlements developed in the late seventeenth century. By the late nineteenth century it was an array of technologies that made European conquest possible: medical technologies (such as the discovery of quinine as a prophylactic against malaria), transportation technologies (such as steamships and railroads to penetrate the interior), and military technologies (such as the rapid-repeating Maxim gun).

Several factors drove the European scramble for Africa. In the industrial era, competition for the resources of the tropical world, such as rubber and cotton, intensified. The rise of the powerful new German

state added a political and strategic dimension: the British now had to work to defend the global trade dominance they had earlier taken for granted, and the French sought new territories in Africa partially as compensation for their losses in European wars. New nations like Italy and Germany pursued empire as a form of national self-assertion. Christian missionaries were another constituency promoting empire, explaining it as a means of bringing "civilization" to what Europeans came to regard as a "dark continent." Similar factors were at play in other world regions that had heretofore escaped European colonization, such as Southeast Asia and the Pacific Islands.

Alarmed by the aggressive imperialism of King Leopold II of Belgium, other European nations sent delegates to the Berlin Conference in 1884 to create ground rules for their "effective occupation" of African lands. Leopold's huge fiefdom in Central Africa, the "Kongo Free State," was a brutal military-economic empire. As many as 10 million Africans died as the region's rubber was plundered to feed industrial and consumer markets in the West.

African responses to the challenge of European imperialism were complex, conditioned by the rapidity with which the colonialist enterprise unfolded. Diplomacy was a common approach. Particular rulers and societies might benefit from allying themselves with the Europeans, as did the kings of Buganda, north of Lake Victoria, who expanded their territory at the expense of traditional rivals by allying themselves with the British. But the Europeans were organized on a scale that African states could not match, and one by one African societies lost their sovereignty.

African wars of resistance to colonial occupation were common in the period from 1890 to 1910, but

In this drawing the Scottish explorer and Protestant missionary David Livingstone preaches to potential African converts. Livingstone's mid-nineteenth-century expeditions filled huge gaps in Western knowledge of central and southern Africa.

successful only in Ethiopia. King Menelik II (1844–1913) built a professional standing army, equipped it with the latest rifles, and played European powers off one another. Victory over the Italians in 1896 allowed Ethiopia to retain its status as an indigenous kingdom. But like independent Siam (Thailand) in Southeast Asia, it was but a modest exception to the rule of direct imperial control being imposed by Europe. For Africa as a whole, the period from the Berlin Conference (1894) through World War I (1914–1918) was a period of instability, violence, and population loss.

Colonial Political Economy, 1914 to 1940

During the period from 1914 to 1940, the European powers devised a number of strategies to allow them to govern colonies and benefit from them economically. The British grafted the colonial state onto existing African institutions through a system known as “indirect rule.” Traditional “chiefs” of African “tribes” administered “customary law” under the guidance of British officials. Meanwhile the French cultivated an elite of Africans who associated themselves with French values. As in Vietnam, these *indigènes évolués* (evolved natives) could even aspire to French citizenship. However, for most Africans such opportunities meant nothing, and forced labor and authoritarian colonial directives were the norm.

Belgian administration was even more paternalistic than the others, with the Catholic Church and mining companies leaving little room for African participation in state institutions. Portugal, a poor country with few resources to invest, did even less to prepare Africans for participation in a modern state. A crucial distinction was whether the Europeans came to settle. In French Algeria, Portuguese Angola, British Kenya and Rhodesia, and in South Africa, it was the settler factor that dominated all other aspects of political and economic life. Here Africans were dominated by aggressive European immigrants who came not just to govern them, but to take their land.

Settler-dominated farming in these regions was one form of what the economic historian Ralph Austen has called “regimes of competitive exploitation.” To provide labor for settler farms, mining enterprises, and commercial plantations, Africans were often restricted to crowded “native reserves” (to use the South African term) where, unable to meet demands for tax payments to the state, they were forced into a cycle of migrant labor. With the loss of labor and the overuse of inadequate land in the reserves, African agricultural productivity declined. Women were usually left to shoulder the burdens of rural poverty.

The second economic pattern identified by Austen is the *peasant-étatiste* regime. Here basic factors of

Colonial rulers of Africa sought to gain wealth from mining minerals. This photo shows a De Beers diamond mine in South Africa in the late nineteenth century.

production—land, labor, and cattle—remained in African hands. But peasant life was greatly altered by the mandate to produce goods for the global economy: colonial taxes had to be paid in cash, and that meant growing commercial crops. In some cases African initiative was evident, as in the Gold Coast (today's Ghana), where African farmers responded to market incentives by making the colony the world's largest producer of cocoa. In many cases, however, market incentives were so weak that colonial officials used coercion to force African production. Such was the case with cotton, which apart from bringing little revenue to African farmers required significant labor and exhausted the soil. Forced cotton growing was the cause of several revolts against European authority.

Colonial economics led to regional differentiation. The transportation infrastructure, geared toward the export of raw materials and the importation of manufactured goods, concentrated investment and development in certain areas while draining labor from others. In West Africa, the coastal regions were developed at the expense of the more arid savannas of the interior. In South Africa, the “white” areas of the country—the settler farming regions and the increasingly industrial

cities and mine compounds—were developed at the expense of “native reserves.”

Africa and the Twentieth Century, 1914 to 1994

While colonial Africa had distinctive traits, it is best understood in the context of twentieth-century world history. During World War I (1914–1918) the Europeans mobilized the human and natural resources of their empires. While Indian soldiers fought for Britain in its fight with Germany's Ottoman allies, the famous Senegalese Sharpshooters, young men from West African villages, served in the trenches of Europe. East and Southwest Africa were theaters of war as the Germans defended their colonies from British and South African attack. Most of the soldiers were African, with European officers in command. Great civilian suffering resulted from forced conscription and the spread of disease and hunger that accompanied the fighting.

Representatives of Africa's fledgling nationalist movements went to Paris in 1919, but like their Asian colleagues their voices were ignored by the great powers. The war had set in motion a process that

would undercut the viability of European colonial empires—for example, by forcing the British to cash in many of their global financial assets to finance their struggle with Germany. Rather than recognizing and acting on that historical shift, however, the British and French augmented their existing empires through the “mandate system,” which reallocated former German colonies (and Ottoman provinces) to the victorious allies.

In the 1920s, colonial administrative and economic systems developed in a context of rising prices on world commodity markets. Soaring African production of coffee and cocoa led to increased tax revenues. But the Great Depression brought an end to that period of relative prosperity. Commodity prices plunged, with no significant recovery until the 1950s. A logical peasant response was to return to subsistence production, but that was not be allowed by colonial states dependent on cash crop production for their revenues, and state coercion in African agriculture increased. Colonial taxation had enmeshed African producers in the cash nexus of the global market.

World War II (1939–1945) also had profound implications for Africa. The British mobilized large numbers of African conscripts; many Kenyan and Nigerian soldiers saw action in Burma (defending British India from Japanese assault) while white South African soldiers fought to liberate Ethiopia from the Italians who had occupied the African kingdom in 1935. North Africa was a major theater of war. Most French colonial governors, in Africa as in Southeast Asia, allied themselves with the collaborationist Vichy regime. But the governor of French Equatorial Africa, Félix Éboué (1884–1944), a descendent of slaves from French Guiana, declared his support for the Free French forces, making the city of Brazzaville an important center of French resistance to fascism.

The war was a watershed in African history. Returning soldiers brought greater knowledge of the world back to Africa’s towns and villages. Allied wartime propaganda had asked Africans to sacrifice in the interests of “freedom,” a term that now fully entered the vocabulary of African politics. Before the war only a tiny elite of Western-educated Africans

had imagined the possibility of self-governing or independent African states. Now there was a much wider social constituency for that idea, especially among young Africans who were anxious to escape the confines of colonialism and play a larger role in the world.

Leaders such as Kwame Nkrumah of Ghana, Léopold Senghor of Senegal, and Jomo Kenyatta of Kenya returned to Africa from sojourns to Europe and the United States to lead new movements of mass nationalism. In doing so, they were following the example of nationalists in India, which had gained full independence from Britain in 1947. Conflict and occasional violence marked the independence struggle in most colonies, but independence was frequently achieved through peaceful negotiation. Such was the case in the Gold Coast. In 1957 Kwame Nkrumah became its prime minister, changed the name of the country to Ghana, and set a precedent for the continent as a whole.

In settler colonies, however, colonialism could not be overthrown without significant violence. In Kenya the settlers refused to compromise with Jomo Kenyatta’s Kenya African National Union. The ensuing Mau Mau Revolt (1954–1960) led to thousands of deaths, mostly African, before independence was achieved in 1964. The violence was even greater in Algeria, where independence from France followed a bitter eight-year war (1954–1962) and cost a million lives.

The Cold War (1945–1991) often played a major role in regions where violence accompanied decolonization. The Kongo became a Cold War battlefield as independence led to civil war, with the United States successfully backing an authoritarian, anticommunist dictator named Mobutu Sese Seko. Portugal refused to give up its colonies without a fight, and its NATO-backed government fought a long war with Soviet-supported insurgents before the independence of Angola and Mozambique in 1974. Similarly, Marxist guerrillas fought the white settler regime in Rhodesia, finally securing majority rule in 1980 and renaming their country Zimbabwe.

In South Africa, the struggle was even more prolonged. Even after the fight against German fascism

had discredited racism as a political ideology, white South African voters supported the creation of an apartheid state after 1948. Under the leadership of Nelson Mandela, the African National Congress used nonviolent civil disobedience to oppose apartheid, but the response was increased repression. In 1964, Mandela and his colleagues were sentenced to life in prison after they turned to sabotage as a means of resistance. In a Cold War context, the United States and Great Britain were reluctant to put too much pressure on the apartheid regime, given the significant Western investment in South Africa's profitable mining and industrial sectors and the strongly anti-communist stance of its leaders. But major uprisings throughout the late 1970s and 1980s, in which African students played a major role, kept pressure on the regime. In 1994 Nelson Mandela became the first president of a democratic South Africa. The colonial era in African history was finally at an end.

The Legacies of Colonialism

Political geography is perhaps the most obvious legacy of colonialism. With a map created by Europeans for their own purposes, Africans have struggled to create viable nations within the borders bequeathed to them. The problem of creating strong nation-states has been compounded by other political legacies of colonialism. Ethnic politics is one example. As elsewhere in the world, when mass politics developed in Africa there was a tendency for ethnic and/or religious identifications to be heightened. The development of such ethnic identities was often encouraged by colonial powers as part of a divide-and-rule strategy. Since such identities rarely corresponded with national boundaries, ethnic subnationalism became a major challenge to national cohesion in new African states. The legacy of authoritarian rule inherited from colonialism, with weak structures of civil society to counterbalance state power, has also had unfortunate effects across the continent.

The economic legacies of colonialism have been equally problematic. The inherited transportation infrastructure, geared toward the export of agricultural

goods and raw materials, has made it difficult to integrate African economies within and between nations. Even while Africa's manufacturing sector has grown, problems of economic underdevelopment remain. Africans still often produce what they do not consume, and consume what they do not produce, remaining dependent on the vagaries of international commodity prices.

Africans have had difficulty making positive use of the political and economic legacies of colonialism. But the same is not true in cultural and intellectual life, where African encounters with global cultural influences over the past century have been remarkably fruitful. In music and in the visual arts, for example, Africans have absorbed European and other cultural influences without sacrificing a distinctly African aesthetic. Similarly, as Africans have accepted new religions, most notably Christianity and Islam, they have infused them with beliefs and practices rooted in their own cultural traditions. It is in these cultural, intellectual, and spiritual domains that hope resides for the African continent to surmount the challenges remaining from the colonial period.

Africa—Equatorial and Southern (4000 BCE–1100 CE)

The growth of the equatorial and southern portion of Africa, once referred to as the Bantu expansion, began about 4000 BCE with the adoption of an agricultural way of life in West Africa. The eventual development of states and towns, as well as cultural, technological, and economic changes, progressed for thousands of years and still continues today.

During the more than five thousand years from 4000 BCE to the beginning of the second century in the second millennium CE, sweeping transformations of economy, technology, culture, and society took shape stage by stage across the equatorial and southern regions of Africa. Historians of Africa used to treat this immensely complex history as if it were a single development, which they called the Bantu expansion, and that expression lingers on in some books. There is an element of truth in this designation: a major accompanying feature of this long history was the widening establishment of Bantu languages across the greater part of nearly half of Africa.

But the driving forces of change in that long sweep of time were a succession of transformations in lifeways—the shift from hunting and gathering pursuits to agriculture, the adoption of new technologies, the rise of specialized production for the market, and the eventual emergence, although not everywhere, of states and towns. The initial impetus for these transformations came from West Africa. Between 8000 and 5000 BCE, peoples speaking languages of the Niger-Kongo family, had independently developed a savanna-based agriculture, originally raising grain crops, black-eyed peas, African groundnuts (*Vignasubterranea*), and bottle

gourds. Even earlier, in the tenth millennium, their ancestors had invented the first ceramics in world history. By the fifth millennium BCE, they supplemented cultivation with the tending of guinea fowl and goats. The addition of yams and oil palms to this system during the same era allowed Niger-Kongo peoples for the first time to spread from the savannas into the West African rainforests of the coastal hinterland.

Early Agricultural Spread—Equatorial Rain Forests

The first spread of West African planting agriculture into equatorial Africa came about in the fourth millennium BCE. Two Niger-Kongo communities from west central Cameroon initiated this era of change. Coastal Bantu people settled along the Atlantic littoral near the mouth of the Ogowe River, where their descendants still live today. The second group, the ancestral Nyong-Lomami Bantu, filtered at first into the areas around the Nyong and lower Sanaga rivers in modern-day Cameroon. With the one exception of the Coastal Bantu of the lower Ogowe River areas, all the far-flung Bantu languages of later times descend from the ancestral Nyong-Lomami tongue. Both groups brought with them an economy that combined fishing and hunting with the cultivation of yams, oil palms, black-eyed peas, African groundnuts, and gourds and the raising of goats and guinea fowl. They introduced the first pottery to the region, along with the technologies of boat building and polished-stone tool making.

Their settlements brought them into contact with the diverse Batwa hunter-gatherer societies, whose

ancestors had inhabited the rain forest zones for thousands of years. (The Batwa are often called by the pejorative term *Pygmies*). The Batwa entered into trade relations with the newcomers, bartering surplus products from their forest hunting and gathering, such as honey and ivory, for the pottery and polished stone axes of the Bantu-speaking communities.

The Bantu-speaking farmers and fishers introduced a new kind of settlement and a new type of social structure to the rain forest regions. In contrast to the mobile bands of the Batwa, the Bantu communities resided in sedentary villages. Each village was the establishment of a particular clan or a particular lineage within a clan, although people of other lineages or clans might also reside in the village. Throughout the period down to early first millennium CE, hereditary lineage chiefs acted as the ritual leaders of these small independent communities. The Batwa, in contradistinction, recognized neither chiefs nor clans and lineages.

The Spread Follows Rivers

A second stage of agricultural expansion in the equatorial rain forest began in the early and middle centuries of the third millennium. Between 2800 and 2400 BCE, the Nyong-Lomami communities spread southeastward, following the major rivers deep into the rain forest zone. By the twenty-fifth century BCE their descendants had formed a long string of communities extending for hundreds of kilometers along the Sangha and Middle Kongo Rivers. Around 2500 BCE, even before this second period ended, a new direction of agricultural spread commenced among Nyong-Lomami people living around the confluence of the Sangha and Kongo Rivers. From these areas Nyong-Lomami communities spread south down the Lower Kongo River as far as the southern edges of the rain forest zone.

Finally, between 2100 and 1200 BCE, there ensued a fourth period of new settlements in the forest. The historian Kairn Klieman has described it as an era of filling in, because in this period Nyong-Lomami

Although the Map of Beatus (776 CE) shows the world south of North Africa as uninhabitable, the region had been home to humans for some 200,000 years.

peoples moved with their economy and technology into many of the areas that lay between the major rivers. One offshoot of the Nyong-Lomami, the Savanna Bantu, spread out along the southern fringes of the rain forest. Other communities settled in the far western equatorial region between the Kongo River and the Atlantic coast, and still others spread into the farther northern and eastern parts of the equatorial rain forest.

Batwa Relations with Their Bantu Neighbors

The third and fourth periods of settlement brought more and more of the Batwa into direct contact with the Bantu farming-fishing communities. Nevertheless, major areas of rain forest remained occupied solely by Batwa, and most if not all Batwa still pursued a fully hunting and gathering way of life. Their material relations with Bantu communities continued to revolve around the trading of the occasional surplus products of their subsistence pursuits.

Most interestingly of all, this coexistence of two differing life ways had a potent religious dimension. The Niger-Kongo religion of early Bantu-speaking

communities recognized three levels of spiritual power: a single Creator God of all things; territorial spirits, with powers limited to particular locales; and on the communal level, the ancestor spirits of each particular community. Most important to the Bantu were the ancestor spirits. The burial of the ancestors on one's land and the veneration and giving of offerings to them secured one's right to that land. As the farmers and fishers spread into new areas, where their ancestors had not lived, their own beliefs required them to seek accommodation with the Batwa. The Batwa, according to the Bantu view of things, were the first owners of the land. It was the Batwa whose ancestors had lived there, and it was they who knew how to deal with the spirits of the land. As a result the Batwa often came to play key roles in the rituals of the Bantu-speaking villagers. The villagers reinterpreted the Batwa spirits of the forest as territorial spirits, and in their origin myths they credited the Batwa with being the bringers of crucial environmental and technological knowledge.

Changes in the Equatorial Rain Forests

Late in the second millennium BCE a new kind of development, large villages, began to appear in several areas of the equatorial rain forest. Apparently, as Bantu farming populations grew, they began to rely to a growing extent on agriculture and less on hunting and fishing to feed themselves. As that happened, the small villages and hamlets of the first four periods of Bantu settlement in the rain forest grew, here and there, into villages with hundreds of people, often divided up into several different lineages and wards.

Between 1000 and 500 BCE even more fundamental changes in economy began to take shape across equatorial Africa. A central element in these changes appears to have been the spread of ironworking technology. Because iron ore deposits were unevenly spread, the adoption of ironworking led directly to a new kind of trade over long distances in the rain forest regions. Communities without iron resources turned to the specialized production of other kinds

of goods in order to join in the new commercial relations. Many communities located right along the great rivers became fishing specialists, catching and drying fish for the market. In areas where the raffia palm grew well, local inhabitants began to weave raffia cloth not just for their own needs but to supply a growing market for fine cloth. The increased quantity and variety of goods, moving over long distances along the rivers, in turn created a demand for much larger boats. During the past thousand years communities in the hinterland of the rivers supplied this demand by becoming specialists in building long canoes from the great forest trees and selling these boats to the traders along the rivers, and this pattern is likely to have held true in the first millennium BCE as well.

Not least, the Batwa in many areas transformed their relationships with Bantu-speaking communities by themselves becoming specialist producers of forest products, including, among other goods, ivory, monkey and leopard skins, and honey and beeswax. Often, as a result, Batwa communities no longer fully supplied their own food needs, but instead supplemented their diet by trading for foods grown by the farmers. This kind of economic relationship enhanced the Batwa ability to participate in the new economy. At the same time, it also caused their fortunes to become much more closely intertwined with those of their farming and fishing neighbors.

Woodland Savannas and the Western Rift

Along the east and south of the equatorial rain forest, rather different trends of historical change predominated among Bantu peoples between 1200 BCE and 500 CE. Over the first eight centuries of this era two new fronts of population expansion and agricultural transformation opened up. All along the southern margins of the rain forest, a variety of peoples speaking Western Savanna and Central Savanna Bantu languages established themselves in the characteristic woodland savanna environments found there. These regions had somewhat lower yearly rainfall than the

rain forest, but still enough rain to support extensive tree cover. The environment suited the raising of yams, the old staple of the early Bantu farmers, and the many perennial streams and rivers allowed for extensive fishing.

The second front of advance lay at the eastern edge of the Kongo Basin, along Africa's great Western Rift. The Western Rift is a 1500-kilometer-long string of deep valleys, large lakes, and old volcanic mountain ranges separating the vast Kongo Basin from the savannahs of eastern Africa. The great variations of terrain and altitude create a mosaic of diverse environments in the Western Rift: grasslands in the bottomlands of the valleys, high-rainfall forests on the lower and middle mountain slopes, and savanna and dry woodlands, especially extending eastward from the rift. The Mashariki Bantu, the easternmost of the Savanna Bantu groups, arrived in this region around the end of the second millennium BCE. They spread at first into the highland forests, where high rainfall supported their accustomed ways of farming and fishing. Over the centuries from around 1000 to 400 BCE the Mashariki expanded north and south along the Western Rift, diverging into two large clusters of communities—the Kaskazi in and around modern Rwanda, and the Kusi farther south in areas not yet satisfactorily identified, but probably centered along the western side of Lake Tanganyika.

The Western and Central Savanna Bantu of these centuries continued the older pattern of their Nyong-Lomami ancestors—they spread the agricultural frontier into regions previous entirely inhabited by hunter-gatherers. The Kusi and the Kaskazi, in contrast, faced a very different challenge between 1000 and 400 BCE. In the mountain forests where they first settled, the previous inhabitants were Batwa food collectors similar in culture and economy to the Batwa of the Kongo Basin. But in the grasslands and savannas of the northern parts of the Western Rift, other, very different agricultural societies, whose crops and animals prospered in drier environments, preceded the Bantu. These peoples were heirs of the Sudanic agricultural tradition, the historical roots of which extend back to the southern and eastern Sahara of

the ninth millennium BCE. Speaking languages of the Nilo-Saharan and Afrasian language families, they raised the African grains sorghum, pearl millet, and finger millet as their staples, and they herded goats and sheep and, in favorable areas, cattle.

In this encounter of diverse cultural and economic worlds, the Kaskazi and the Kusi were the ones who made the crucial adaptations. As they gradually cleared more forest for their fields, they created more areas in which grain crops could be grown. The benefits of this opening for new agricultural practices tended to flow in one direction: finger millet and sorghum could be readapted to wetter conditions, once forest land was cleared. But yams, the crucial crops of the early Kaskazi and Kusi, required more rainfall than the drier savannas provided. So while the Kaskazi and Kusi were able over time to fit sorghum, finger millet, and other Sudanic crops into their agriculture, most of their Nilo-Saharan and Afrasian neighbors maintained their earlier practices with little change.

By the second half of the first millennium BCE, the Kaskazi and Kusi had evolved a new agricultural synthesis. It is clear that they still favored yams as their staple food, but their overall repertory encompassed a wide range of crops, some suited to wet environments and others to relatively dry climates; a varied kit of cultivating tools; and new techniques of field management. They had adopted the fire-hardened digging stick used by the Nilo-Saharan farmers in grain cultivation. The middle of the first millennium BCE was also the period of the invention of iron hoes, which made tilling the fields before planting much more efficient and made it much easier to harvest root crops such as the yam. Some of the Nilo-Saharans also became hoe cultivators, but not to the same extent as the Bantu communities.

Ironworking technology in the Western Rift dates as early as 1000 BCE, and it was from there that this new technology diffused westward to many Bantu of the equatorial rain forest. Nilo-Saharan peoples living along the Nile-Kongo watershed were the earliest iron users in this part of Africa. Kaskazi people learned ironworking from them by around the ninth

and eighth centuries BCE, and the Kusi peoples farther south began to take up the technology after 500 BCE. The earliest iron items were most likely ornaments and small points and blades. Smiths began to forge larger blades for hoes, axes, adzes, and spears probably only from around 500 BCE onward.

Agricultural and Technological Change

The new developments in agricultural technology and production set off a new era of the expansion of Kaskazi and Kusi communities into an entirely new range of environments. From the fourth to the first century BCE, one group of Kaskazi peoples, whom historians call the Great Lakes Bantu, scattered out eastward from the Western Rift into several areas around Lake Victoria. Several different Kaskazi communities relocated to the well-watered woodland savannas and tablelands of far southern Tanzania. Other Kaskazi groups, who switched over entirely to cattle raising and grain cultivation, moved even farther south, to the dry open savannas of east central Zambia. Late in the period still other Kaskazi communities leapfrogged the dry central regions of East Africa and took up lands far to the east, in the better watered areas along the East African coast and around the mountains of northeastern Tanzania. During the same era the Kusi peoples moved into the areas surrounding Lake Malawi. In northern Tanzania and in the Great Lakes region, the incoming Bantu initially settled in environmental islands of wetter climate, with Nilo-Saharan and Afrasan neighbors in the nearby grasslands and drier savannas. In southern Tanzania, Malawi, and Zambia, however, both Kaskazi and Kusi peoples expanded the agricultural frontier into areas previously occupied only by hunter-gatherers.

Between 100 BCE and 300 CE the second stage of this expansion took place. Kusi peoples scattered out southward from Malawi to Zimbabwe, Mozambique, and the eastern side of South Africa. The Kaskazi at the same period grew in numbers, founding new settlements in the highlands of Kenya and in the coastal hinterlands and spreading more and more widely in western and southern Tanzania.

The effects of these developments were not restricted to Bantu-speaking communities. The keeping of sheep and cattle, in particular, appears to have spread southward ahead of the advance of the Kaskazi and Kusi. Sometime between 400 and 100 BCE several groups of Khoisan hunter-gatherers living in what is today northeastern Botswana took up the raising first of sheep and then of cattle. Combining their older hunting and gathering practices with a highly productive herding economy, one such people, the Khoikhoi, rapidly spread south after 100 BCE to the South African coast and then eastward to the Cape of Good Hope. In the same centuries, a related pastoral society, the Kwadi, spread livestock raising eastward to northern Namibia.

Equally significant, as the Kaskazi and Kusi peoples moved into new areas, knowledge of the African grain crops diffused westward from them to the Bantu communities of the woodland savannas. Adopting these crops, along with ironworking, between approximately 400 and 100 BCE, the Central and Western Savanna Bantu lessened their dependence on high-rainfall environments and entered into a new era of population growth and expansion. Between 100 BCE and 300 CE, several different Western Savanna peoples followed river routes southward into the dry savannas of present-day western Zambia and interior Angola. The ancestral Southwest Bantu moved farthest south, settling along the Kunene and Okavango Rivers in the dry steppes of the far northern Kalahari region. There they took up cattle raising under the influence of their Kwadi neighbors. In the early centuries of the first millennium CE, several Central Savanna peoples also spread out with their now more varied crop repertoire, establishing themselves as far south as central and southern Zambia.

Chiefdoms and States, 300–1100 CE

As far as scholars can presently tell, nearly all Bantu-speaking societies retained the old Bantu pattern of belonging to localized clan and lineage polities down to the end of the first millennium BCE, with one probable exception. Among certain Great Lakes Bantu

along the southeast side of Lake Victoria, there is indirect evidence that local intensive iron production may have enabled small wealthy kingdoms to develop for a time during the last couple of centuries BCE and first three centuries CE. Environmental collapse caused by the overcutting of forests to supply the smelting furnaces brought this period of political growth to an end by the fifth century CE. Wider-reaching political authority conceivably may also have accompanied the rise of large villages and long-distance trade in the first millennium BCE in the equatorial rain forest, but so far no evidence of such political structures has yet been found.

Between 400 and 1100, however, there is clear evidence in three different regions of the emergence of territorial chiefdoms or very small kingdoms. Among the Great Lakes Bantu, chiefdoms and tiny kingdoms emerged anew in several areas, both in the Western Rift and along the western shores of Lake Victoria. The first notable states took shape thereafter, in about 1000.

In the Kongo Basin chiefdoms became prominent along the major river arteries of commerce several centuries before 1100. The most striking material testimony of this development was the spread of a particular kind of chiefly or royal regalia, the flange-welded double bell, all around the Kongo Basin before 1000 and as far south as Zambia and Zimbabwe by 1100. The new political economy of this age surely rested on new elaborations of commercial relations, although the specific features of these relations remain unclear.

A third region of emerging chiefdoms and petty kingdoms, dating between 400 and 900, lay just south of the Limpopo River in northern South Africa. In the tenth century several royal families migrated northward with their followers across the Limpopo. Bringing with them the new concept of rule by kings and chiefs, they founded the first significant kingdoms at Shroda just north of the river and subsequently, in the eleventh century, at Mapungubwe just south

of the Limpopo. In the first period, up to the ninth century, royal wealth in cattle was the material basis of the chiefdoms. From the tenth century onward, international demand (arriving via the Indian Ocean) for African gold and ivory ratcheted upward the scale and complexity of the political order and stimulated the emergence of urban centers, of which Shroda and Mapungubwe were the earliest. The Zimbabwe empire of the thirteenth to fifteenth centuries arose on these foundations.

Away from the core regions of political and commercial growth, however, many older patterns of life persisted. In the equatorial rain forest, the last great spread of the agricultural frontier was that of the Bantu-speaking Mongo, who displaced the Batwa across the central Kongo Basin only between 400 and 1100 CE. In eastern and southern Africa, Bantu speakers have continued to expand into new niches down to the present century.

What scholars used to call the Bantu expansion was in fact a complex of varied and distinctive histories extending over five thousand years and across many different lands. That story is told here in barest outline, covering only the main linking themes of those multifaceted pasts.

Africa—Postcolonial

In 1945 the Fifth Pan-African Congress convened with the goal of ending colonialism in Africa. By 1960 Africa had experienced successful independence movements in several countries, and many military overthrows of government ensued. A general unity has not yet settled on the continent, however. Efforts to build a “United States of Africa” after colonialism have been hindered by the HIV/AIDS epidemic and religious disputes.

After World War II, Africans and those of African descent met at the Fifth Pan-African Congress in Manchester in the United Kingdom in 1945, where one of their primary aims was to formulate strategies for ending colonialism on the continent. Several independence movements around the continent were sparked or gained a new momentum as a result of the congress’s activities. By 1960 several African countries had freed themselves of their colonial masters or were actively engaged in struggles to achieve that goal. In the following decades the African continent experienced many political, economic, and social challenges as well as moments of glory that have helped determine its current position in world history.

Impact of Colonialism

Colonialism’s impact on the African continent was dramatic: colonialism was autocratic, and it set up artificial boundaries that privileged certain regions (or ethnic groups within those regions). Colonial authorities exploited the territories they controlled for their mineral wealth, and agricultural potential was poorly developed. This colonial legacy was a huge

challenge for the new governments in the early post-colonial period.

The fact that colonial powers had not established democratic governments in the lands they controlled predisposed the newly established independent governments to continue noninclusive traditions of governing. During the colonial era police forces had been used to quell disturbances, put down protests, and arrest political agitators; many of these practices continued after independence. The fledgling independent states did not have the means to address major concerns such as better employment opportunities, housing, and developing adequate health care and educational systems. Often, out of political expediency, the new governments catered to privileged classes or ethnic groups that were the equivalent of mini nations within larger states.

The Organization of African Unity (OAU)

At the core of the idea of a united African continent was the Pan-Africanist Kwame Nkrumah (1909–1972), the first leader of an independent Ghana. His vision of a United States of Africa took a step forward with the formation of the Organization of African Unity, whose charter was signed on 25 May 1963 in Addis Ababa, Ethiopia. Among the conditions for membership were political independence and government by majority rule. There were thirty charter members, among them Ghana, Morocco, Algeria, Libya, Nigeria, Liberia, Sierra Leone, Ethiopia, Senegal, and Chad.

The general aims of the OAU were to promote unity and solidarity among African states, to respect

and defend member nations' sovereignty and the integrity of their borders, and to promote intercontinental trade. However, the OAU had no real authority over its member states, and the reality was that external forces (notably the United States and the Soviet Union) had significant influence over the various political and economic positions taken by many of the OAU's member states. While the OAU did use its influence to mediate or attempt to resolve various conflicts on the continent (for example, conflict in Mozambique in the mid-1970s, the Somalia-Ethiopian war of 1977, and civil conflicts in Chad in 1980–1981), it was less successful as the unifying force that Nkrumah had envisioned.

Military Governments

Military takeovers of governments have been a consistent feature of postcolonial African life. Between 1960 and 1990 there were more than 130 coup attempts, close to half of which were successful. By the late 1990s African countries collectively were spending more of their national budgets on military expenditures than on education and health systems combined.

Kwame Nkrumah was ousted from power by the military in 1966; the military retained control on again and off again until 1992. Nigeria, Africa's most populous country, was the setting of a violent military overthrow in January 1967 in which the president and several other prominent politicians were assassinated. Subsequent events in that country led to the outbreak of a devastating civil war (1967–1970, also known as the Biafra War). In some cases military leaders assumed power to prevent the total breakdown of the government, and in some cases the political infighting, governmental corruption, and civil unrest the country endured before the takeover were so severe that the population actually welcomed military intervention. This was the case with Nigeria in 1967 when its first coup took place. But although military governments were able to enforce the rule of law, they were no better at addressing issues of poverty, health care, land reform, and employment than the civilian governments they had toppled.

Forging National Unity

Nation building has been a major challenge for modern African nations. Colonial "divide and rule" policies had often privileged one group over another in terms of political power or access to commercial advantages. The period before and after World War II (when nationalist sentiments began to surge) saw the emergence of ethnic (sometimes referred to as "tribal") associations and unions. In several cases these became the basis of more formal political parties. While the various disparate factions shared the single goal of independence, once that was achieved ethnic partisanship frequently became a stumbling block to national unity. There are close to a thousand different ethnic groups represented on the African continent, and from childhood a people are made aware of their ethnic identity as keenly (if not more) as they are made aware of their national identity.

Ethnic conflicts in the postcolonial era have been routine. Whether it is Yoruba versus Hausa versus Igbo in Nigeria, Kikuyu versus Luo in Kenya, Shona versus Ndebele in Zimbabwe, Zulu versus Xhosa in South Africa, or Hutu versus Tutsi in Rwanda, these conflicts have continued to haunt many modern states. The 1994 Hutu-Tutsi conflict in Rwanda led to a genocidal massacre in that country. Political leaders have often actively or subtly exploited ethnic rivalries for political gain. Such is typically the case when resources are limited: political leaders favor one group as a means of maintaining that group's loyalty and support.

Some countries have used creative strategies to combat ethnic polarization. After Nigeria's devastating civil war, it began a policy of mandatory national service for its youth. After completing secondary school in their home territory, the participants were required to spend a year performing some service-related activity (such as tutoring younger students) in another part of the country, ideally where they would be exposed to a different language and cultural tradition.

Zimbabwe adopted an innovative strategy in the early 1980s in its creation of Heroes Acres. These stylized cemeteries were created throughout the country

This contemporary wall painting, *Mastering Colonial History the Namibian Way*, “deconstructs” the Reiterdenkmal (equestrian statue), a monument built to symbolize German victory over indigenous peoples in 1910.

to honor those who had died during the struggle for independence. In thus honoring a deceased combatant or hero, the state sought to minimize the polarization that could be caused by different ethnic funerary practices.

One-Party States

One way in which a number of modern African leaders and countries have attempted to combat the persistent problem of ethnic polarization has been through the establishment of so-called single- or one-party state. The theory is that if there is only one political party, there will be less of a tendency for people to

divide along ethnic lines, and more emphasis could be placed on nation building and tackling other social concerns, such as economic development. Proponents of a one-party state suggest that when there is just one party, individual talent has the opportunity to rise through the ranks of the party to achieve leadership position and recognition, regardless of ethnicity. Another argument put forward in support of a one-party state is that democracy as it has been described in the West is foreign to the African continent, which traditionally had chiefs, kingdoms, and top-down rule. Prominent postindependence leaders who have spoken persuasively in favor of this “traditional” form of government include Julius Nyerere (1922–1999) of

Tanzania and Kenneth Kaunda (b. 1924) of Zambia. Many African countries that began as multiparty states have become, either de jure or de facto, single-party states: today the majority of African states are one-party states.

The advantages that proponents of a one-party state have touted have not materialized, however. Economically, Tanzania under Julius Nyerere performed very poorly because of his adherence to strict socialist ideology. The one-party systems in Malawi, Zaire, and Uganda were very repressive, restrictive, and even brutal at times. In some cases ethnic loyalties continued to be exploited. Furthermore, because one-party states have a tradition of controlling the media, it is difficult for dissenting views to be heard.

After years of political infighting and dramatic instances of violence in Zimbabwe, the two major political parties—the Zimbabwe African People's Union (ZAPU) and the Zimbabwe African National Union (ZANU)—emerged as a united single party ZANU (PF) in 1987, thus making Zimbabwe a de facto single-party state. Others political parties were not outlawed, but the power apparatus clearly fell into the ZANU (PF) sphere of control. It was not until the early twenty-first century that a viable opposition party emerged. The Movement for Democratic Change (MDC) seriously challenged ZANU, which quickly passed laws, instituted restrictive practices, and, according to members of the opposition, engaged in political intimidation to limit its rival's access to the public and chances for success.

One development took place in Kenya at the end of 2002. After years of de facto single-party rule, the Kenya Africa National Union was defeated in free and fair national elections by the newly formed National Rainbow Coalition (NARC) with a minimum of disturbances. This signified a new direction for Kenya and possibly for other African countries. However NARC rule in Kenya was short-lived, ending in 2005.

Economic Strategies

Throughout the postcolonial period there have been multiple efforts to expand economic cooperation

among African countries as a means of countering outside unfair trade practices. In 1967 the East Africa Community (EAC), which fostered cooperation among Kenya, Tanzania (by 1967 Tanganyika had become Tanzania, which also included Zanzibar), and Uganda, was established, but it fell apart a decade later, when disputes between Kenya and Tanzania broke out and Tanzania invaded Uganda to oust Idi Amin (1924/1925–2003). The Economic Community of West African States (ECOWAS) was established in 1975 to ease trade among its sixteen member states. Similarly, the Southern African Development Coordinating Conference (SADCC) formed to combat South Africa's economic dominance of that region. These agreements have not been without problems, however. In the case of ECOWAS, for example, Nigeria has been able to use its power as the country with the largest economy and population in the region to force its will on the smaller states.

Directions and Challenges for a New Century

In 2004, South Africa celebrated its tenth anniversary as an independent African state. Ten years earlier, after years of political and often violent resistance, the African National Congress (ANC) under the leadership of Nelson Mandela (b. 1918) took control of the government. Although Mandela served only one term in office as South Africa's first president elected by the entire population, he occupied a larger-than-life position throughout the African world.

As Africa's largest and most prosperous economy, South Africa is poised to lead the rest of the continent. Nelson Mandela's successor, Thabo Mbeki (b. 1942), called for an African renaissance, which he envisioned as a regeneration of African pride, technology, innovativeness, and accomplishment.

The promise of this African renaissance, however, is in danger of being sidetracked by the HIV/AIDS pandemic, which has the potential to ravage the African continent in the same way the bubonic plague devastated fourteenth-century Europe. How

My humanity is bound up in yours, for we can only be human together. • Desmond Tutu (b. 1931)

the African continent deals with the pandemic will determine what sort of future awaits the next generation.

The other threat facing the continent is the outbreak of religious violence in various countries. While outbreaks of violence between Christians and Muslims have occurred in Nigeria since the mid-1980s, they have intensified more recently (within the last five years). Efforts to handle these conflicts have been minimum, and the root causes of the disputes have not really been dealt with. In other parts of West Africa there continue to be religious tensions, but they are not nearly so severe as in Nigeria. The World Conference on Religion and Peace (WCRP; founded 1970), a coalition of representatives of the world's great religions, has encouraged Christian and Muslim leaders in the region to work together through the formation of organizations such as the Inter-Religious Council of Sierra Leone (IRCSL; 1997), which in 1999 helped bring about the signing of the Lomé Peace Accord in that nation. There are many African organizations that seek to address the delicate issue of religious intolerance on the continent. One of the primary aims of the Project for Christian-Muslim Relations in Africa (PROCMURA) is the facilitation of constructive engagement between Christians and Muslims. As part of the effort to improve relations, participants have shared gifts and sent greetings and goodwill messages on the occasion of major religious festivals. They have also formed joint committees of Christians and Muslims to address such issues as the implementation of Islamic law in northern Nigeria and

to encourage governments to stop making aid and political appointments dependent on one's religious affiliation. Such efforts represent an African solution to an ongoing challenge in the region.

African American and Caribbean Religions

The African slave trade had a huge impact on the transformation and spread of African religions worldwide. Numerous ethnic groups taken from Africa shared similar belief systems, which carried over to the New World. Though beliefs and practices often persevered within groups, forced migration and interaction with Europeans helped develop and change African American and Caribbean religions into what they are today.

African American and Caribbean religions are the products of one of the greatest forced migrations in human history. Historians estimate that between 1650 and 1900 more than 28 million Africans were taken from Central and West Africa as slaves. At least 12 million of these Africans crossed the Atlantic Ocean to be sold in the Caribbean, South America, and North America. While Africans from many parts of Africa were taken into slavery, West African groups were disproportionately represented. Beginning in the early sixteenth century and continuing, officially, until 1845 in Brazil, 1862 in the United States, and 1865 in Cuba, more than 11 million black Africans—Yoruba, Kongo, and other West Africans—were brought to the Americas to work sugar, tobacco, coffee, rice, and cotton plantations.

The African slave trade transformed economies around the world. In Africa, it stimulated the growth of powerful African kingdoms, while in the Islamic world, the African slave trade expanded commerce in the Indian Ocean and the Persian Gulf. In the Americas, it was a key component in the success of plantations established by Europeans. In addition, wealth generated by slavery transformed European

economies dramatically, and the African slave trade also transformed African religions and fostered the spread of these religions around the world.

African Religions in the New World

In the Americas, the institution of slavery persisted much longer in some places than others. With the exception of African slaves in Haiti—who initiated a revolution in 1791 and in 1804 established the first black republic in the Americas—Africans became emancipated in the Americas in the following order: Jamaica and Trinidad in 1838; the United States in 1863; Puerto Rico in 1873; Cuba in 1886; and Brazil in 1888. These dates are highly significant. For example, the ethnologist Pierre Verger (1968) contends that the “purest” forms of African religion are to be found in northeastern Brazil primarily because the slave trade to Brazil continued illegally into the twentieth century.

Of the Africans taken to the Americas as slaves, 99 percent came from an area stretching from modern-day Senegal and Mali in the north to Zaire and Angola in the south. This corridor encompasses a number of ethnic groups belonging to the Niger-Kongo language family. A common language base and common cultural traditions facilitated the movement and exchange of people, goods, and ideas along this corridor.

These ethnic groups also shared similar concepts concerning deities, the universe, the social order, and the place of humans within that order. Unifying themes of African systems of belief and worship include the following: the idea that there is one god who created and controls the universe; a focus on blood

Religious and other culturally significant articles are on display at an Afro-Caribbean celebration.

sacrifices; and belief in the forces of nature, ancestral spirits, divination, the magical and medicinal powers of herbs, the existence of an afterlife, and the ability of humans to communicate with deities through trance-possession states.

Descendents of Kongo and Yoruba peoples account for about 17 percent of the African population in Jamaica, while the Akan and Kalabari account for, respectively, 25 percent and 30 percent of the Jamaican population. It is estimated that on Cuba and Hispaniola (the island that is home to Haiti and the Dominican Republic) Kongo ethnic groups constitute 40 percent of the African population, while the Yoruba and other related groups shipped from the Bight of Benin make up, respectively, 15 percent and 40 percent of the African populations of Haiti and Cuba. Among the descendants of slaves in the United States, it is estimated that one in four African Americans is of Kongo descent and that one in seven African Americans is of Yoruba descent. It should be noted that few slaves came to the United States directly from Africa. Most had worked plantations elsewhere before being sold in the United States.

These percentages are important for understanding African religions in the New World. Whenever a large

number of slaves from a particular place in Africa were sold to a single New World location, they were better able to preserve selected aspects of their religions. Such religious retentions were never exact replicas of African religious practices. They represented a syncretism or blending. One reason for this is that African tribal religions were revealed over time. Only elders possessed extensive religious knowledge. During the early years of slavery, elders were seldom enslaved because older captives rarely survived the rigorous passage to the New World. Most first-generation slaves were under twenty years of age, and few were over thirty. Their knowledge of religious ritual was limited to what they had personally seen and/or experienced. On the other hand, later in the slave trade there were African religious specialists (like Robert Antoine, the nineteenth-century founder of the first Rada compound in Trinidad) who voluntarily migrated to the Caribbean specifically to establish African religious centers in the New World.

The relationship between African religions as practiced in Africa and these same religions in the New World is replete with examples of what Pierre Verger (1968, 31) has termed “flux and reflux.” Building on a lifetime of fieldwork and archival research,

Verger documented extensive and continuous contact between religious specialists in Africa and religious organizations in the New World. He painstakingly demonstrated that the slave trade was not only “of” Africans (i.e., as objects of the trade itself), but “by” Africans as well, in the sense that Africans and African Americans were not only laborers but also producers and traders in the plantation system, and thus played an active role—not just a passive one—in the ongoing drama of slavery. But Verger also notes that such “flux and reflux” was rare during the early days of slavery, and most sixteenth- and seventeenth-century slaves were forced to improvise from a limited knowledge of African religious traditions.

On both sides of the Atlantic the meeting of religions among Africans and people of African descent involved more than Christianity and the traditional religions of Africa. It also involved Islam. Working its way from the Sahara long before Christianity began to touch the coast of West Africa, Islam—like Christianity—interacted in complex ways with the traditional religions of Africa. Brought to the Americas by enslaved African Muslims, Islam struggled to survive in an inhospitable, Christian-dominated environment.

African and African American religions have always been at the center of debates concerning the retention of African cultural traits in the New World. Some prominent scholars, most notably the sociologist E. Franklin Frazier (1964), have suggested that New World slavery was so disruptive that few African traits were able to survive. Other scholars, most notably the anthropologist Melville J. Herskovits (1941), have argued effectively for the survival of African traits in New World societies. Herskovits’s view has predominated, but the issue remains complex (see Mintz and Price 1992).

The quest for African cultural traits in the New World continues, but with new and refined sensibilities. The question is no longer whether, but how much? As Stuart Hall (1990, 228)—commenting on the *presence africaine* in his native Jamaica—noted,

Africa was, in fact, present everywhere, in the everyday life and customs of the slave quarters, in

the language and patois of the plantations, in names and words; often disconnected from their taxonomies, in the secret syntactical structure through which other languages were spoken, in the stories and tales told to children, in religious practices and belief in the spiritual life, the arts, crafts, music and rhythms of slave and post-emancipation society....Africa remained and remains the unspoken, unspeakable “presence” in Caribbean culture. It is “hiding” behind every verbal inflection, every narrative twist of Caribbean cultural life.

African American religious institutions in the United States and the Caribbean provide valuable insight into the inner workings of African American and Caribbean societies and cultures. Moreover, it is appropriate for social scientists to devote their attention to religion because—as C. Eric Lincoln and Lawrence Mamiya so effectively argued (1990, xi)—“religion, seriously considered, is perhaps the best prism to cultural understanding, not as a comparative index, but as a refractive element through which one social cosmos may look meaningfully at another and adjust its presuppositions accordingly.”

Two erroneous assumptions have informed past studies of African and African American religions. The first is that the black experience of religion simply replicates white religious experience; the second is that it is totally dissimilar to it. Neither assumption is true because neither takes into account the complex interactions between African-based religions and other world religions. Correctly viewed, African American religious experience cannot be separated from North American religion. It is of one fabric. African religious experience is part and parcel of North American religious experience just as Christianity and Islam are now part and parcel of religious experience on the continent of Africa. Nevertheless, exact genealogies of African and African American religions are difficult to discern.

African Religions in the Caribbean

The best-documented religions—such as Haitian Vodun, Rastafarianism, Cuban Santería, and the

Spiritual Baptists in Trinidad—serve as prime examples of creativity and change in this dynamic region, which has become a fertile ground for the development of new religious admixtures and syncretism. Almost everyone in the Caribbean is from someplace else, and Caribbean religions have been greatly affected by the presence of Europeans, Africans, and—to a lesser extent—by Asian people as well. A majority of these religions have either an African or Christian base, but Caribbean peoples have modified selected aspects of these traditions, added to them, and made them their own. While much attention has been given to African influences, one cannot completely understand religious developments in the region solely in terms of an African past. The African past is a piece—albeit a large piece—of a more complex whole. Syncretism of Hinduism and Christianity abounds, and one can never underestimate the potential impact of Islam.

Rastafarianism is perhaps the most widely known of Caribbean religions. It is difficult to estimate the exact number of Rastafarians, but the religion's influence vastly exceeds its numbers in Jamaica, elsewhere in the Caribbean, in Europe, Latin America, and the United States. The movement traces its history to a number of indigenous preacher-leaders in the 1930s, most notably Leonard Howell, Joseph Hibbert, Archibald Dunkley, Paul Earlington, Vernal Davis, Ferdinand Ricketts, and Robert Hinds. The influence of Marcus Garvey is also apparent. Each of these leaders—working in isolation from the others—came to the conclusion that Haile Selassie (1892–1975), then enthroned as Ethiopian emperor, was the “Lion of Judah” who would lead all peoples of African heritage back to the promised land of Africa. In the Amharic (Ethiopian language), Ras Tafari means “head ruler” or “emperor.” It is one of the many formal titles belonging to Haile Selassie.

While Rastafarianism is by no means a homogeneous movement, Rastafarians share seven basic tenets: (1) black people were exiled to the West Indies because of their moral transgressions; (2) the wicked white man is inferior to black people; (3) the Caribbean situation is hopeless; (4) Ethiopia is heaven; (5) Haile Selassie is the living God; (6) the emperor of Ethiopia will arrange for all expatriated persons

of African descent to return to their true homeland; and (7) black people will get revenge by compelling white people to serve them. Among contemporary Rastafarians different subgroups stress different elements of the original creed; for example, the alleged death of Haile Selassie (a large number of Rastafarians believe that Haile Selassie is still alive) has raised significant questions regarding Selassie's place in the movement.

Cuban Santeria combines European and African beliefs and practices. But unlike Vodun, the religion is inspired mainly by one African tradition—that of the Yoruba. In Santeria, the Yoruba influence is marked in music, chants, and foodstuffs, and by sacrifice. During major ceremonies, blood—the food of the deities—flows onto sacred stones belonging to the cult leader. These stones are believed to be the objects through which the gods are fed and in which their power resides. A significant religious development in North America has been the large-scale transfer of Cuban Santeria to urban centers, notably New York, Miami, Los Angeles, and Toronto. It is estimated that there are currently more than 100,000 Santeria devotees in New York City alone.

The Spiritual Baptists are an international religious movement with congregations in Saint Vincent (where some Baptists claim the faith originated), Trinidad and Tobago, Grenada, Guyana, Venezuela, Toronto, Los Angeles, and New York City. Membership is predominantly black, but in recent years congregations in Trinidad have attracted membership among wealthy East Indians and Chinese. A central ritual in the Spiritual Baptist faith is known as the mourning rite. This is an elaborate ceremony involving fasting, lying on a dirt floor, and other deprivations. A major component of the mourning rite is discovering one's true rank within the church hierarchy.

A critical issue in the study of Caribbean religions is the selection of a unit of analysis. Because syncretism plays such a prominent role in the development of religions in the region, it is often difficult to separate indigenous and foreign elements. Since there has been so much outreach, it is often difficult to discover the “true” origin of any single religious group.

Because most of the religions considered here lack a denominational chain of command, one cannot make statements about them as one might about the Roman Catholic Church or Presbyterianism. The most accurate assessments refer to individual congregations and their leaders. To examine movements such as Rastafarianism, Santeria, Vodun, and the Spiritual Baptists as if they were unified denominations on the European and North American model is to present an overly coherent picture of an incredibly fragmented and volatile religious situation.

African Religions in the United States

Scholarly studies on African American religion in the United States are often traced to W. E. B. Du Bois's classic *The Negro Church* (1903), "which constituted the first major book-length study of African American religion in the United States. Employing a wide range of research strategies (historical, survey, interview, and participant-observation) Du Bois explored multiple aspects of African American religious life including church finance, denominational structures, and beliefs. Du Bois characterized the Black Church as the first distinctly African American social institution" (Zuckermann 2000, 109). Subsequent studies of the Black Church were much more limited in scope. As noted, later scholars confined their attentions to the retention of African cultural traits in the New World, and scholars debated the extent to which African American religion draws from African religion in its diverse forms. Few slaves came directly to the United States from Africa, and the presence or absence of so-called Africanisms is more difficult to discern in American religions than in those of the Caribbean. Nevertheless, bits and pieces of African religious concepts and rituals are present in North America—but in greatly modified forms. These concepts and rituals include the call-and-response pattern in preaching, ancestor worship, initiation rites, spirit possession, healing and funeral rituals, magical rituals for obtaining spiritual power, and ecstatic spirit possession accompanied by rhythmic dancing, drumming, and singing.

Prior to the American Revolution, few American slaves were exposed to Christianity. Initially, planters did not promote the conversion of their slaves to Christianity because they feared that it might give slaves ideas about equality and freedom that were incompatible with slavery. Over time, however, slave owners became convinced that a highly selective interpretation of the Gospel message could be used to foster docility in their slaves. During the First Great Awakening (1720–1740), some free blacks and slaves joined Methodist, Baptist, and Presbyterian congregations. The Second Great Awakening (1790–1815), with its numerous camp meetings, attracted more slaves and free blacks to evangelical forms of Protestantism. In the eighteenth century, Methodists emerged as leaders in developing effective religious instruction among the slaves. Following its creation in 1845, the Southern Baptist Convention also undertook aggressive missionary work among slaves. Religion scholar Albert Raboteau (1978) has suggested that the Baptists were especially successful because baptism by immersion resembled West African initiation rites.

Throughout the United States, slaves worshiped in both mixed and segregated congregations. Masters often took house slaves with them to religious services at their own (predominantly white) churches, where blacks were required to sit in separate galleries. In addition to attending church services with their masters, slaves held secret religious meetings in their own quarters, in "praise houses," or away from the plantation in so-called hush arbors.

During the time of slavery, African Americans in the United States never experienced complete religious freedom, but a number of independent African American congregations and religious associations arose. Two early Baptist churches, the Joy Street Baptist Church in Boston (which was established in 1805) and the Abyssinian Baptist Church in New York City (which was established in 1808), were founded in response to discrimination in racially mixed congregations. Black Baptist congregations in the Midwest formed separate regional associations in the 1850s, and the first Baptist association, the National Baptist Convention, U.S.A.,

was formed in 1895. Black Methodists also established independent congregations and associations during the antebellum period. A group of blacks belonging to the Free African Society, a mutual aid society within St. George's Methodist Episcopal Church in Philadelphia, severed ties with its parent body in 1787 in response to what some black members saw as discriminatory practices. A majority of the dissidents united to form St. Thomas's African Episcopal Church in 1794, under the leadership of Absalom Jones. Richard Allen led a minority contingent to establish the Bethel African Methodist Episcopal Church. The Bethel Church became the founding congregation of the African Methodist Episcopal (AME) Church—the single largest black Methodist denomination. St. John's Street Church in New York City, with its racially mixed congregation, served as an organizational nexus for what became the second major black Methodist denomination, the African Methodist Episcopal Zion (AMEZ) Church.

African American religions became more diverse in the early twentieth century as blacks migrated from the rural South to northern cities. By this time, two National Baptist associations and three black Methodist denominations were already well established as the mainstream churches in black urban communities. Often these denominations cut across class lines. Conversely, black congregations affiliated with white-controlled Episcopalian, Presbyterian, and Congregational churches catered primarily to African American elites. Although mainstream churches attempted to address the social needs of recent migrants, their middle-class orientations often made migrants feel ill at ease. As a consequence, many migrants established and joined storefront churches. In addition, recent migrants became attracted to a wide array of Holiness-Pentecostal Churches, Sanctified Churches, and Spiritual Churches, as well as various Islamic and Jewish sects. Other independent groups, with such names as "Father Divine's Peace Mission" and "Daddy Grace's United House of Prayer for All People" also gained prominence. Today, approximately

90 percent of churchgoing African Americans belong to black-controlled religious bodies. The remaining 10 percent belong to white-controlled religious bodies. African Americans are also to be found within the memberships of liberal Protestant denominations, the Mormon church, the Southern Baptist Convention, and various groups such as the Jehovah's Witnesses, Unity, and the Seventh-day Adventists. There are more than 2 million black Roman Catholics in the United States, many of them recent migrants from the Caribbean.

A number of prominent African American religions in the United States are based on the teachings of Islam. Noble Drew Ali established the first of these, the Moorish Science Temple, in Newark, New Jersey, in the early twentieth century. The main teachings of the Moorish Science Temple were incorporated into the Nation of Islam, founded by Wallace D. Fard during the early 1930s in Detroit. Later, the Nation of Islam came under the leadership of the Honorable Elijah Muhammad. The Nation of Islam grew rapidly, in part due to the militant preaching of Malcolm X during the early 1960s. Rapid growth did not check schismatic tendencies that led to the appearance of numerous splinter groups, including the Ahmadiyya Muslim movement of Chicago, the Hanafis of Washington, D.C., and the Ansaru Allah community of Brooklyn. Following the assassination of Malcolm X and the death of Elijah Muhammad, Elijah's son, Wallace D. Muhammad, transformed the Nation of Islam into the more orthodox group known as the American Muslim Mission. To counter the Mission's shift to orthodox Islam, Louis Farrakhan established a reconstituted Nation of Islam.

Caribbean-based religions are among the fastest-growing religions in the United States. As noted above, Vodun, Rastafarianism, and the Spiritual Baptists have established large congregations in New York, Los Angeles, Miami, and other urban centers, attracting Caribbean migrants and American blacks, as well as a small number of white converts. Cuban Santeria is perhaps the most racially mixed and widespread of these religions.

I shall allow no man to belittle my soul by making me hate him • **Booker T. Washington (1856–1915)**

An African American Aesthetic

African and African American peoples do not conceptualize religion as something separate from the rest of their culture. Art, dance, and literature are understood as integral to the religious experience. This is aptly illustrated by the musician B. B. King's comment that he feels closest to God when he is singing the blues. Spirituals, the blues, gospel, rhythm and blues, bebop, Afro-Latin, and hip-hop are all rooted in West African sacred and secular music traditions. West Africans understand music as a means of propagating wisdom. In the Yoruba tradition, music stirs things up, it incites. West African music and art begin with God, the ideal. For example, Afro-Cuban music continues the African tradition of dispersing and expounding upon fixed and recurring God-generated themes that embody cultural ideals and values.

While African American music is derived from a variety of sources, religion has historically served as one of its major inspirations. As C. Eric Lincoln and Lawrence Mamiya (1990, 347) observe, "In the Black Church singing together is not so much an effort to find, or to establish, a transitory community as it is the affirmation of a common bond that, while inviolate, has suffered the pain of separation since the last occasion of physical togetherness."

Eileen Southern (1983) traced African American spirituals to the camp meetings of the Second Awakening, where blacks continued singing in their segregated quarters after the whites had retired for the night. According to Lincoln and Mamiya (1990, 348), black spirituals also appear to have had their roots in the preacher's chanted declamation and the intervening congregational responses.

The "ring shout," in which "shouters" danced in a circle to the accompaniment of a favorite spiritual sung by spectators standing on the sidelines, was a common practice in many nineteenth-century black churches. By 1830, many black urban congregations had introduced choral singing into their services. "Praying and singing bands" became a regular feature of religious life in many black urban churches.

Despite the opposition of African Methodists and other religious leaders to the intrusion of "cornfield ditties" into formal worship services, folk music became an integral part of African American sacred music.

According to Southern, black gospel music emerged as an urban phenomenon in revivals conducted in tents, football stadiums, and huge tabernacles. In 1927, Thomas A. Dorsey promoted what he called "gospel songs" in churches in Chicago, the Midwest, and the rural South. At a time when many Baptist and Methodist churches rejected gospel music, Sanctified churches (an aggregate of independent congregations stressing experience of the Holy Spirit and personal piety as keys to salvation) in both urban and rural areas embraced it wholeheartedly. The Church of God in Christ has been a strong supporter of contemporary gospel music. Spiritual churches (like the Israel Universal Divine Spiritual Churches of Christ, the Metropolitan Spiritual Churches of Christ, and the Universal Hagar's Spiritual Church) also accepted gospel music, and in New Orleans jazz is an integral feature of their worship services. In time, many mainstream congregations have incorporated gospel music into their musical repertoires.

African American religions in the Caribbean and the United States represent a coming together of African and European cultures in yet a third setting—that of the Americas. They are products of both voluntary and forced migrations, and represent a dynamic blending of Old World and New World faiths. E. Franklin Frazier (1964, 50–51) correctly argued that African American religion historically has functioned as a "refuge in a hostile white world." At another level, it has served as a form of cultural identity and resistance to a white-dominated society. In addition to serving as houses of worship, black churches were and are centers of social life, ethnic identity, and cultural expression in the African American and Caribbean communities.

African Religions

Various traditional religions found in Africa are based on belief in one Supreme Being, while others embrace Earth deities, secret societies, and possession cults. Christianity and Islam, commonly practiced, came to Africa in the first centuries CE and the eighth century, respectively. Modern religion in Africa is a distinct blend and balance of traditional beliefs and new religious systems.

Africa is home to numerous “traditional” religions as well as various forms of Islam and Christianity and various more recent religious developments. There are certain religious characteristics that can be found in African spirituality that transcend any particular religion. Examining a sampling of traditional religions and Islamic and Christian denominations provides an insight into those overarching African spiritual characteristics.

Secret Societies

Secret societies, common among certain African peoples found mainly in West Africa, especially those among whom age-determined groups are not common, often have religious functions. They also unite people in different residence areas without kinship ties.

The religious or ritual knowledge of the secret society is not revealed to nonmembers. Allowing only members to know the secret—and, perhaps, only those members of a certain rank—adds to a secret society’s mystery. Moreover, membership is limited to people of a given category. Categories can be as broad as all married women or all initiated men. There are

categories for fishermen, hunters, craftsmen of all types, and market women, among others.

The Poro and Sande societies (for men and women, respectively) in Liberia have long interested anthropologists because these societies are major forces aiding government and facilitating social change. The Kpelle tribe opens a Sande bush school (which performs an initiation ceremony) every three or four years. Women of the Sande society are in complete control of the ceremony and school. Members of the initiation class are all girls between nine and fifteen years of age. They learn all they need to know to be Kpelle women from Sande members during the school session, which lasts from six weeks to three months.

During this period, Sande members perform cliterodectomy operations (cliterodectomies and circumcisions are common rites of passage in Africa), which are part of the transition from girlhood to womanhood. Sande members then perform rituals for those who have completed the bush school, marking their entrance into Kpelle society as women. Men of the Poro society dress in ritual regalia to welcome the women back into society.

A Supreme Deity

Most traditional African religions acknowledge one Supreme Being, though that creator god is often thought to have removed himself from the human sphere after creation, so that more focus is placed on lesser deities. In Sudan, for example, shrines exist in great numbers to lesser spirits but not to the creator god. The Yoruba of Nigeria acknowledge a Supreme Being, Olorun, but

A mosque in Capetown, South Africa. Mosques are focal points of communal worship for Muslims around the world. Photo by Frank Salamone.

it is the host of secondary deities, or *orisha*, that is the focus of Yoruba attention. Mulungu, the Supreme Being of the peoples of the great lakes region of East Africa, is only turned to in prayer after all other prayers have failed. But numerous African scholars and scholars of Africa dispute the interpretation that the creator god is viewed as remote. These scholars argue that the creator god is not remote, and rather that people can and do approach this god quite frequently. They indicate that there is a parallel with Christianity and its hierarchy of angels and saints.

In Sudanic religions, people are said to consult with the Creator before their birth, telling him what they want to do in life. The Creator gives each person what is needed to accomplish his or her fate. If

a person fails, then he or she is said to be struggling against his or her chosen fate. Luck is focused in the head, so a person who has been lucky in life is said to have a good head.

In general, Africans deem that powers come from the Supreme Being. The Dogon of Mali, for instance, believe that the vital force of their Supreme Being, Amma, circulates throughout the universe. They name that vital force *nyama*. Other groups have similar beliefs. These forces control the weather and are associated with the forces of nature, directly or through the high god's servants.

Other Deities

There are Earth goddess cults in a number of societies. The Ibo of the lower Niger River area have the goddess Ala, and the goddess Asase Ya has devotees among the Ashante peoples of Ghana. The presence of a deity linked to a certain phenomenon or natural feature reflects the importance of that phenomenon or natural feature in daily life; hence the fact that the Yoruba worship Ogun, the god of iron, reflects the people's sense, from the days when iron first began to be used, of its importance.

Storm gods are in some way related to the Supreme Being. Storm gods generally command their own priests, temples, and ritual ceremonies. The Yoruba and Ibo have a full storm pantheon of gods of storm, lightning, and thunderbolt. Shango is the Yoruba lightning and thunder god; he is worshipped along with his wives, who are river gods, and the rainbow and thunderclap, which are his servants.

Islam and Christianity

Islam first came to the savanna areas of Africa through trade and peaceful teachings in the eighth through tenth centuries. The benefits of centralized government under Islamic law were obvious to various chiefs. Under Islamic law rulers were able to unite tribal elements into a coherent whole. The kingdoms of Wagadu (Ghana), Mali, Songhai, Kanem, and Bornu and the Hausa emirates were

A Shi'a Shrine in Capetown. South Africa's multicultural society embraces diverse religious expression and beliefs. Photo by Frank Salamone.

all centralized states that adopted Islam to their advantage.

The introduction of Islamic government and law also provided an excuse for religiously sanctioned rebellion against rulers who were not living up to the strict tenets of Islam, according to various religious military rulers. In the 1800s, militant Muslims objected to the halfhearted Islamic faith of their rulers and led holy wars against those whom they considered lax in the faith.

These nineteenth-century jihads were common among the Fulani peoples. They upset the balance that had prevailed since around the thirteenth century between local rulers, who adhered to Islam, and their subjects, who continued to practice traditional religions. Although the Fulani tend to be pastoralists, there were a number of settled Fulani who had intermarried with Hausa or other settled peoples. One

result of these religious wars was that Fulani rulers replaced local rulers in the areas where the rebellions took place.

Christianity reached Africa in the first centuries CE, before it entered Europe. The Coptic Church (in Egypt), for example, go back to the first century of Christianity and still exists today. It, like the Ethiopian Orthodox Church, is a Monophysite church; that is, it teaches that Christ had a single nature rather than two distinct (human and divine) natures. The Ethiopian Orthodox Church has a large hierarchy of saints and angels, many monasteries and convents, and a strong worship of Mary, Gabriel, Michael, and Ethiopia's patron, St. George. There are many African saints, including Tekle Haimanot and Gabra Manfas Keddus. There is also belief in demons and other evil spirits, as well as in witchcraft and possession.

Possession Cults

Possession cults are one feature of traditional African religions that both African Christians and Muslims participate in, although often undercover. Although possession cults can be found in many regions, we will focus on the situation among the Hausa. In a 1975 study, the anthropologist Ralph Faulkingham notes that the Muslim and “pagan” Hausa in the southern Niger village he studied believed in the same spirits. Both believed in the same origin myth for these spirits as well. According to the myth, Allah called Adama (“the woman”) and Adamu (“the man”) to him and bade them to bring all their children. They hid some of their children. When Allah asked them where those children were, they denied that any were missing, whereupon Allah told them that the hidden children would belong to the spirit world. These spirits may, on occasion, take possession of those living in the everyday world.

Indigenous theology linked dead ancestors to the spirits of place in a union that protected claims and relationships to the land. Spirits of place included trees, rock outcroppings, a river, snakes, and other animals and objects. Rituals and prayers directed toward the spirits of family and place reinforced communal norms and the authority of the elders in defending ancient beliefs and practices. In return for these prayers and rituals, the spirits offered protection from misfortune, adjudication, and divination through seers or shamans, who worked with the spirits to ensure good and counteract evil. The Hausa incorporate those beliefs into their Islamic beliefs.

The majority of Muslim Hausa who participate in the spirit possession cult, called the Bori cult, are women and members of the lower classes; as one rises in social standing, one’s practice of Islam tends to become stricter and more orthodox. The Bori rituals among the Hausa appear to be rituals of inversion; that is, traditional societal rules are turned on their heads. People who are possessed may behave in ways that would not be accepted in

other circumstances. The Bori cult is widely understood as being a refuge from the strongly patriarchal ideal of Hausa Islam. Thus both women and effeminate males find some respite there. Indeed, the Bori cult provides a niche open to marginal people of all kinds, not simply women or homosexuals. Butchers, night soil workers, musicians, and poor farmers are welcome there. Mentally disturbed people of all classes similarly seek refuge among the Bori devotees.

African Religions Today

The peoples of Africa have been adept at accepting new religious systems while preserving essential features of traditional beliefs, and that approach to religion continues today, when New Age and Evangelical Christian denominations have become popular. An African base adapts new ideas and fits them to a basic pattern of kinship, personal spirits, ancestors, and age grades, seeking to fit all of these into personal networks of relationships.

African Union

The African Union is an international organization of African states. Formally established in 2002, it succeeded the Organization of African Unity, which was founded in 1963. Originally designed to advance the pan-African cause, the African Union still seeks to promote socioeconomic integration across the African continent, with the aim of achieving greater unity and solidarity between African countries and their peoples.

The African Union is in part the result of the end of colonialism in Africa and a burgeoning desire for a united African identity, called the pan-African movement. This movement gained real impetus following the Bandung Conference of 18–24 April 1955 in Indonesia where Asia and Africa came together to oppose colonialism and promote greater economic and social cooperation. Originally founded in 1963 as the Organization of African Unity (OAU), it was reconstituted as the African Union after member states ratified the Constitutive Act adopted in July 2000. In line with its origins, the OAU was largely concerned with economic and cultural issues, and while the member states professed pleasure with the performance of the OAU, they also said they wished to reform the relationship of the member states in an effort to better realize the goals of African unity on which the OAU was originally premised. As such, the AU has evolved more along the lines of the European Union, with organs such as an Assembly, Executive Council, Commission, Peace and Security Council, Pan-African Parliament, Economic, Social and Cultural Council, and Court of Justice. The evolving nature of the union has also seen it expand its

objectives to include the promotion of democracy, human rights and good governance. This expanded agenda potentially conflicts with the organization's traditional principles of observing state sovereignty and non-interference in the internal affairs of member states.

The Pan-African Dream

By the early nineteenth century, many Africans who had been educated in Europe began to speak and write of an African identity that transcended linguistic and ethnic groupings as well as colonial identifications. It is not clear when the term *pan-Africanism* was first applied in this context, and most people who used the word appeared to recognize it as little more than a dream. The idea of continental unity was certainly on the minds of delegates from the Caribbean, North America, Europe, and Africa who met in London for the First Pan-African Congress in 1900. The congress called for an end to colonial rule in Africa, citing its negative effects on Africans and proclaiming the need for all Africans—including those of African descent outside the continent—to come together in support of a greater African social and political entity.

This congress was followed by numerous expressions of similar ideas, including important statements by the Gold Coast political activist Charles Casley-Hayford, as well as various organizational expressions, perhaps most notably the Universal Negro Improvement Association founded by the Jamaican activist Marcus Garvey in 1914. Several international conferences promoting African solidarity followed, the first in 1919, coinciding with the Versailles Peace Conference at the end of World War I, followed by a

series of others throughout the 1920s. By the 1930s, colonial governments in Africa grew deeply suspicious of activities claiming pan-African connections, but the dynamics stimulating ideas of African unity grew more forceful with the onset of World War II.

African Independence and Continental Unity

Following World War II, many politically aware Africans believed independence from colonial rule was certain, if not imminent. Confirmation of this idea came first in northern Africa, with Libya's release from Italian control in 1951; but perhaps the most significant development was the creation of the new nation of Ghana, from the former British West African colony of Gold Coast, in 1957. Some African leaders, especially Ghana's first president, Kwame Nkrumah, saw this as a signal portending the creation of a unified, independent continent:

A union of African states will project more effectively the African personality. It will command respect from a world that has regard only for size and influence. . . . It will emerge not just as another world bloc to flaunt its wealth and strength, but as a Great Power whose greatness is indestructible because it is built not on fear, envy, and suspicion, nor won at the expense of others, but founded on hope, trust, friendship and directed to the good of all mankind. (Nkrumah 1961, xii)

Nkrumah actively campaigned for this principle of African unity, believing it would be the best way to encourage an end to all vestiges of colonialism on the continent. At a May 1963 meeting of African heads of state in Addis Ababa, Ethiopia, Nkrumah presented a formal plan to have all African nations join in the creation of such a union. By the end of the meeting, the more than thirty nations represented agreed to the creation of the Organization of African Unity.

Organization of African Unity

The OAU was in one measure a victory for the pan-African movement that had preceded it, especially in the arena of international efforts to remove all traces

of colonialism in Africa. A nine-nation Liberation Committee worked to promote independence for Africans continuing to live under colonialism and also to bring about majority rule for Africans living in South Africa. These efforts were a substantial part of the successful international efforts that eventually led to the end of apartheid and to a new South African government in the 1990s.

But the price of this pan-African victory was a significant limitation of the scope and power of the OAU as an effective international organization. The core of this dilemma was in the first principle enunciated in its charter—"the sovereign equality of all member states"—which included a commitment to "non-interference in the internal affairs" of any member state (African Union n.d.a). In practice, this limited what the OAU might achieve in promoting many of its other goals, including the protection of the rights of Africans and the resolution of a number of destructive civil wars on the continent.

One expression of the frustration concerning these limitations was the complaint often voiced by Julius Nyerere, president of Tanzania, that the OAU was merely a sort of trade union for African heads of state that allowed each of them a forum of international expression without any questions about their own sometimes destructive policies. Thus, rather than promoting any real unity, the OAU was seen at times to reinforce the unnatural divisions of the continent that had in fact been the legacy of colonial conquest and administration. Only terribly destructive conflicts in the 1990s in the Kongo, Ethiopia, Somalia, and still later in Sierra Leone and Liberia—the last two of which precipitated intervention by a group of West African states—brought the OAU policies of noninterference seriously into question.

A New Organization

African heads of state meeting in 1999 issued a declaration calling for a reconstituted continental organization modeled loosely on the European Union. One of the keys to the new African Union was a new principle written into its Constitutive Act, adopted in July 2000, which asserted "the right of the Union to

We are not guardians of the earth for our children. It is our children's land which they are lending to us. • **Kenyan Proverb**

intervene in a Member State pursuant to a decision of the Assembly in respect of grave circumstances, namely: war crimes, genocide and crimes against humanity” while also reaffirming the “sovereign equality and interdependence” of all the member states (African Union n.d.b). The AU actually came into existence the following year and was ceremonially launched at a summit in Durban, South Africa, in July 2002.

While the new organization has promised to focus more on economic matters, even moving toward an eventual common currency, given the instability in parts of Africa, the AU cannot help but be forced to confront contentious matters of politics. These efforts have been widely applauded internationally, with significant commitments from the United States and the European Union for a New Partnership for African Development created by the AU member states. But they have also proven to be divisive within the AU. For instance, in respect to the crisis in Zimbabwe—including widespread government violence and interference in elections—some members sought to suspend Zimbabwe and impose sanctions while others refused to interfere. The compromise was to meekly urge a negotiated solution between the ZANU-PF government of Robert Mugabe and the opposition Movement for Democratic Change led by Morgan Tsvangirai.

Nevertheless, on occasion the AU has taken action to intervene in the affairs of member states in the name of peace and security. In 2004 the AU deployed a peacekeeping mission to the Darfur region of western Sudan to prevent inter-ethnic conflict and genocide. Peaking at around 7,000 troops, the AU mission eventually gave way to a United Nations Mission on 31 December 2007. In the absence of a functioning government, the AU has similarly operated a Peace Support Operation in Somalia since March 2007. In a similar interventionist fashion, the AU has suspended Mauritania and imposed sanctions and intervened in Anjouan, Comoros following coups and political turmoil in 2005 and 2007 respectively.

The African Union has a long way to go before it achieves the level of integration seen within the European Union. Nevertheless, the transition from the

OAU to the AU has brought with it broader objectives and a restatement of its quest for unity. While the pan-African vision of its founders remains some way off, and while issues such as the state of affairs in Darfur and Zimbabwe are far from ideal, the AU has begun to take some steps toward achieving its original goals.

Afro-Eurasia

Treating the three very distinct areas of Africa, Asia, and Europe as a single entity—Afro-Eurasia—can foster a greater understanding of themes and events that overlap and cross those conventionally defined borders. As a term *Afro-Eurasia* is a useful geographical category; it should not replace Europe, Africa, and Asia as named areas on the world map, but rather be used as a tool in the historian's methodological kit.

Afro-Eurasia designates the land masses of Africa and Eurasia, together with adjacent islands, as a single spatial entity. The concept of Afro-Eurasia is useful in the study of both historical and contemporary social phenomena whose full geographical contexts overlap in one way or another the conventionally defined continents of Africa, Asia, and Europe. A prominent example is the Roman Empire, which politically unified societies all around the Mediterranean basin, a region that has a fairly uniform climatic and vegetational system. Acknowledgment of the unity of the Mediterranean lands in the larger frame of Afro-Eurasia benefits the study of relatively large-scale developments in the empire, whereas a conception of the basin as made up of three primary and arbitrarily fixed sections—European, African, and Asian—may inhibit investigation of such processes.

The single land mass comprising Eurasia and Africa, the largest on the globe, has never acquired a distinctive and enduring name of its own. This is ironic, since geologists have named a number of great land areas, Pangaea, Gondwana, and Laurasia, for example, that existed in earlier eons before the Earth's tectonic plates arranged themselves into their current

configuration. Afro-Eurasia is sometimes identified as the Eastern Hemisphere or the Old World as against the Western Hemisphere or the New World, that is, the Americas.

Afro-Eurasia's Geographical Profile

Extending from approximately 78 degrees north latitude to 35 degrees south latitude, Afro-Eurasia exhibits a multitude of distinctive climatic and vegetational zones from Arctic tundra to wet tropical forest. The supercontinent's topography is equally varied, including the highest point (Mount Everest) and the lowest point (the Dead Sea) on the Earth's land surface. Afro-Eurasia's climatic and topographical diversity, however, did not deter human beings from populating, at least in sparse numbers, nearly all parts of the land mass and neighboring islands by about twenty thousand years ago. A satellite view of Afro-Eurasia reveals several prominent geographical features that have both challenged humankind's adaptive powers and facilitated travel, migration, and interchange.

Perhaps the most conspicuous feature from satellite distance is the lateral belt of arid and semi-arid land that extends from the North Atlantic coast of Africa to northeastern China. This chain of deserts, scrublands, mountains, and grassy plains includes the great Sahara and the Arabian, Kyzyl Kum, Taklimakan, and Gobi deserts, as well as the dry Iranian Plateau and the semiarid steppes of Inner Eurasia. Except where river valleys run through or other water sources could be tapped, Afro-Eurasia's great arid zone has had low population density relative to the supercontinent's temperate and tropical zones. Nevertheless, human groups began as early as the seventh

millennium BCE to adapt to arid lands by herding animal domesticates on seasonal grasses and eventually harnessing horses, camels, and oxen to carry loads and pull wagons across large expanses of rain-starved land.

Another prominent feature of Afro-Eurasia is the nearly continuous chain of highland ranges that stretches across the land mass from the Atlas Mountains of Morocco to the uplands of western China. Afro-Eurasian highlands have sometimes impeded human movement, notably north and south across the “roof” of the Hindu Kush, Pamirs, and Himalayas. Pioneer travelers, however, inevitably found the high passes, which thereafter became funnels of travel for merchants, missionaries, and conquering armies.

Because the Indian Ocean extends across much of the Eastern Hemisphere’s tropical latitudes, Afro-Eurasia’s only large expanse of tropical rainforest climate is in equatorial Africa, an area significantly smaller than Amazonia’s wet tropics in South America. We must also include southern India, Sri Lanka, and Southeast Asia, both mainland and insular, as part of Afro-Eurasia’s discontinuous tropical belt, lands where humans adapted ecologically in quite similar ways.

The Eurasian part of the supercontinent, whose long axis runs east-west, displays somewhat less floral and faunal diversity than does Africa, owing partly to its relatively narrower latitudinal range. Indeed, in his book *Guns, Germs, and Steel*, the geographer and evolutionary biologist Jared Diamond has argued that, because of the relative evenness of daylight and climate along Eurasia’s long axis, food crops, animal domesticates, and related agricultural technologies have in the past ten thousand years diffused more easily across the region than they have along the long north-south axes of either Africa or the Americas. The reason is that in Africa and the Western Hemisphere migrating farmers and herders had to make repeated adaptations to new climatic conditions.

In Afro-Eurasia’s northwesterly section, several seas penetrate deep into the landmass, which partially explain the relatively early intensification of human cultural exchange and attending technical

innovation and population buildup in that region. Elsewhere on the landmass, long rivers and animal transport technologies facilitated contact between coastal and interior peoples. Moreover, the chain of seas in western Afro-Eurasia (the Baltic Sea, North Sea, eastern coastal Atlantic, the Mediterranean and the Black Sea, Red Sea, and Persian Gulf) connect to the southern seas (the Arabian Sea, Bay of Bengal, and the China seas) to make for a transhemispheric chain of seas that from at least 4000 BCE permitted captains of sail craft to relay goods, ideas, and people from the far east to the far west of Afro-Eurasia.

How Many Continents?

Owing in large measure to the linguistic turn in social and literary research, most scholars today accept the proposition that human beings socially construct and name geographical spaces. Even mountain ranges and river valleys exist in nature only insofar as humans agree on the criteria for determining their characteristics, unity, and limits. Thus, nation-states, ethnic territories, climatic zones, and continents are invariably constructions susceptible to social acceptance, rejection, or modification over time. The idea of Afro-Eurasia is equally constructed as a place on the world map and as an arena of historical developments. So far, however, this construction has gained little attention or credence despite the supercontinent’s ready discernibility on the globe and despite accumulating evidence of complex, long-distance intercommunication among its peoples since very ancient times.

The greatest impediment to recognition of Afro-Eurasia as a geographical entity has been what the geographers Martin Lewis and Kären Wigen call the myth of continents, that is, the doctrine that the world comprises seven major land divisions, three of them being Africa, Asia, and Europe. Western and Western-educated scholars fully articulated the idea that the earth is constituted of seven primary “land worlds” only during the first half of the twentieth century. As late as 1950, for example, geographers were not fully agreed that the Americas constituted two continents, rather than one, or that Australia

deserved continental rather than merely large-island status.

Since the mid-twentieth century, however, the seven-continent scheme has become dogmatic in school textbooks, scholarly literature, geographical atlases, and the popular media, despite fundamental inconsistencies in the very definition of the word *continent*. If a continent is by conventional definition a large mass of land surrounded or nearly surrounded by water, why, critics of the sevenfold categorization have asked, do both Europe and Asia qualify as primary land masses, when no distinct watery division between them exists? Indeed, the conventional definition applies well to Australia, Antarctica, North America, South America, and Afro-Eurasia, making for five continents rather than seven. From this five-continent perspective we may perceive the Mediterranean, Red, and Black seas as internal seas of Afro-Eurasia, since they are inconsequential intercontinental partitions compared with the Atlantic and Pacific Oceans. Indeed, geographers, travelers, merchants, and soldiers have long known by experience the irrelevance of these waters as barriers to human contact. As soon as humans invented sturdy rafts and sailboats, which in the Red Sea region may have occurred as long as 100,000 years ago, people began to traverse these seas and transform them into busy channels of cultural and commercial exchange.

The ancient Greeks, whose world centered on the Aegean Sea, were the first we know of to identify Europe to the northwest, Asia to the east, and Africa to the south as distinct regions. But the Greeks also imagined these three zones as comprising parts of a larger integrated whole, the *orbis terrarum* (“world island”). Considering Greek

commercial and colonial enterprise all around the rim of the eastern and central Mediterranean, as well as in the Black Sea region, such a holistic conception is hardly surprising. Roman scholars, by contrast, despite the empire’s intercontinental span, tended to emphasize the threefold division. Medieval Christians drew maps of a world revolving around Jerusalem, a point technically in “Asia,” but in their worldview the lands northwest of the Holy City, that is, Europe, possessed sharp cultural and historical definition, whereas most of Asia and Africa, lands of heathen darkness, did not.

Europe and Asia: Status as Continents

Almost all societies that share language and cultural traditions also possess a foundational myth that situates themselves at the center of creation. Their territory is the place where the primordial creator made the first land mass and the ancestral human beings. From that “continent,” as it were, humans went forth to populate the rest of the world. The Chinese self-perception as the people of the Earth’s “middle kingdom,” the Hebrew story of the Garden of Eden, and the Muslim idea of the Dar al-Islam (land of surrender to God) versus the Dar al-Harb (land of war) have all served such mystiques of cultural and historical primacy.

The idea that Europe is one of the Earth’s primary land masses had its origins in Greek thought, took root in the Middle Ages, and became canonical in modern times, even as Western geographical knowledge accumulated to reveal the absence of any significant waterway or other physical partition separating the eastern side of Europe from what came to be known as Asia. Thus, Europe’s status as a continent had to rest on exceptional criteria, specifically its

The Hereford Mappa Mundi (English, c. 1280) divides the world into three parts—Africa, Europe, and Asia—surrounded by the ocean stream.

possessing a population that exhibited distinct cultural characteristics—the shared heritage of Western Christendom. Whatever linguistic, cultural, and political differences divided Europeans from one another, they all shared, according to the theory, a piece of the world distinctive for *not* being Asia or Africa, lands inhabited by Muslims and other unfathomable strangers. But because of the absence of any compelling physical border separating Europe from Asia north of the Aegean and Black seas, European intellectuals struggled for several centuries to agree on the location of their continent's eastern, sea-less border. Various rivers flowing north-south across Russia commanded followings, but in the nineteenth century, scholars reached general consensus that the Ural Mountains should be the marker. An obscure Swedish military officer first put forth this idea in the previous century, and pro-Westernizing Russians found it attractive because it emphasized “the European nature of the historical Russian core while consigning Siberia to the position of an alien Asian realm suitable for colonial rule and exploitation” (Lewis and Wigen 1997, 27). In the twentieth century, the Ural partition became dogmatic in Western academic and school geography. It largely remains so today despite the flood of historical evidence showing that those round-topped hills, whose highest peak reaches only 1,894 meters, have never thwarted human communication. Thus, the social construction of the “Continent of Europe” has well served the fundamentally flawed notion that the lands north of the Mediterranean and Black seas possess geographical singularity comparable to both Asia and Africa and that this European entity generated unique cultural ingredients and mechanisms that set it intrinsically apart from those two places, as well as from all other continents.

The eastern land frontier between Europe and Asia has not been the only continental demarcation subject to debate and revision. Medieval European geographers, for example, took it for granted that the Nile separated Africa from Asia, the Red Sea coming into its own as the conventional dividing line only in recent centuries. Contending for a racial definition of continents, a few scholars have asserted that

the Sahara Desert, not the Mediterranean, properly splits Europe from Africa because the desert separates “white” populations from “black” ones.

In the late nineteenth century, scholars introduced the concept of Eurasia, though with a variety of definitions. Eurasia, characterized simply as Asia and Europe as a single land mass, though distinguished from Africa, relegates Europe to the status of subcontinent, that is, a large peninsula of Eurasia comparable to South Asia, Indochina, or Arabia. The idea of a Eurasian continent has also been useful in the study of numerous historical processes whose proper geographical frame is that land mass as a whole. These developments include the dispersion of Indo-European-speaking populations from China to Ireland between the fourth and first millennia BCE; the long-distance migrations and invasions of pastoral groups (Scythians, Germans, Huns, Avars, Magyars, Turks) in the past three millennia; the opening of the trans-Eurasian Silk Roads; the east-west flow of technologies, ideas, and religions; the forging of the Mongol Empire in the thirteenth century; the rise of the Russian Empire in the seventeenth; and the emergence of the Soviet Union after 1917. All these developments notwithstanding, however, Eurasia has not so far come close to disturbing the conventional school wisdom that the world has seven continents, not six.

Afro-Eurasia as an Arena of History

The failure of Eurasia to supersede Europe and Asia on the continental honors list suggests that Afro-Eurasia faces a steep climb to acceptance, despite its value in formulating questions about long-term and large-scale change in world history. The human eye can readily see Eurasia as a single bulk of land but requires serious re-education to perceive the Mediterranean and Red seas, together with the Suez Canal (whose navigational width is 180 meters), as something other than lines between great spatial compartments.

On the other hand, several scholars of world history have either explicitly or implicitly envisaged

Afro-Eurasia as a single field of historical development, thereby ignoring or minimizing the conventional threefold division as having any bearing on the comparative or world-historical questions they wish to pose. In the early fourteenth century, when a chain of Mongol-ruled states stretched all the way from Korea to Bulgaria, the Persian historian Rashid al-Din wrote the *Collected Chronicles*, an immense work of history and geography that encompassed not only the lands of the Dar al-Islam but also India, China, Inner Eurasia, the Byzantine Empire, and Western Europe. Indeed, Rashid al-Din, along with other well-educated scholars and travelers of his time, may have been among the first people in world history to possess a consciousness of Afro-Eurasia in all its length and breadth as an interconnected whole. In the early modern centuries, when geographers were rapidly accumulating knowledge about the earth's every nook and cranny, European scholars wrote a number of "universal histories" that divided the world into primary parts, whether continents or civilizations, but that also acknowledged Asian peoples, if not yet Africans south of the Sahara, as having contributed in some measure to "Old World" history.

In the twentieth century, several world history pioneers, including Alfred Kroeber, Arnold Toynbee, Marshall Hodgson, William H. McNeill, and Leften Stavrianos, adopted varying conceptualizations of the "ecumene" (or in Greek, the *oikoumene*) to describe the belt of interlinked agrarian civilizations that began to emerge in the fourth millennium BCE and that eventually extended from the Mediterranean basin to the North Pacific. Hodgson frequently used the term *Afro-Eurasia* in connection with the ecumene, defined by him as "the various lands of urbanized, literate, civilization in the Eastern Hemisphere" that "have been in commercial and commonly in intellectual contact with each other" (Hodgson 1954, 716). On occasion, Hodgson also employed the term *Indo-Mediterranea*, though without detailed explication, to delineate the region of intense human interactivity that ran from North India to the Mediterranean basin, a region that overlay parts of Asia, Africa, and Europe.

In *The Rise of the West: A History of the Human Community*, William H. McNeill postulated the progressive "closure of the Eurasian ecumene," that is, the interlinking of Eurasian civilizations, as a key historical dynamic, though his definition of Eurasia implicitly incorporated the Mediterranean and Indian Ocean littorals of Africa as well. In the more recent book *The Human Web: A Bird's-Eye View of World History*, William H. and J. R. McNeill have consistently used *Old World* as their term of choice for the Afro-Eurasian landmass, even though many scholars have rejected this phrase as Eurocentric because it implies that the Americas were a new world whose history began when Europeans discovered them.

Philip Curtin, another world history leader, has also described "the gradual formation and spread of a series of intercommunicating zones, beginning from small points in the river valleys and spreading gradually to larger and larger parts of the Afro-Eurasian land mass" (Curtin 1995, 47). In *ReOrient: Global Economy in the Asian Age*, the late Andre Gunder Frank contended that in large-scale investigations of the development of the world economy between the years 1400 and 1800, Afro-Eurasia was a far more relevant geographical unit than Europe, Asia, Africa, or even Eurasia. Arnold Toynbee recognized the climatic, ecological, and historical contiguity of the Sahara and Arabian deserts by coining the term *Afrasian steppes*, an expression that transformed the Red Sea from a continental partition to a long, narrow lake *within* the Afro-Eurasian arid zone. The historian Michael Pearson has suggested that *Afrasian Sea* might well replace *Arabian Sea* in order to acknowledge the long historical associations among peoples of the East African coast, Arabia, Persia, and India. Indeed Pearson, Frank, and Ross E. Dunn have proposed the term *Afrasia* as an alternative to Afro-Eurasia in order to award the land mass a more distinctive name and to erase the hyphenation (Pearson 1998, 36; Frank 1998, 2–3; Dunn 1992, 7). However, this innovation, which conceptually embraces Europe but omits the combining form *Eur-*, has so far attracted few academic buyers.

As the literature of transnational, interregional, and global history has accrued, both scholars and teachers have recognized the liabilities of accepting conventional geographical expressions as natural, fixed, or timeless, because these presumed entities may impose arbitrary and distracting barriers to investigating historical phenomena in their totality. Thus, in order to formulate comparative and large-scale questions about developments that have occurred in the world, historians interested in comparative and large-scale change have in recent years taken a more situational and fluid approach to geographical contexts, shaping them to the specific historical problem at hand. These spatial reorientations include conceptions of the Atlantic basin, the Pacific basin, the Indian Ocean rim, the Mediterranean–Black Sea rim, and Inner Eurasia as zones of interaction different from and sometimes historically more serviceable than the conventional conceptions of civilizations and continents. Afro-Eurasia is simply one among several useful geographical categories, one that should not replace Europe, Africa, and Asia as named areas on the world map, but rather be put to work as a useful tool in the historian's methodological kit.

Agricultural Societies

Agricultural societies, in which the domestication of plants and animals provides a substantial part of human subsistence, are thought to date back as far as 10,000 BCE. Throughout time these systems have changed in intensity as populations increased or declined, and as old technologies gave way to the new.

All societies are pluralistic, encompassing multiple organizational and technological systems. In an agricultural society a substantial part of the means of human subsistence comes from one or more agricultural systems (i.e., systems of domesticated plants and animals that depend upon a specific technology and system of management). Ecologically, the major agricultural systems can be divided broadly into Old World and New World types. Organizationally, they divide into household/peasant, elite, and industrial. A society's agricultural systems interact with its kinship, political, religious, and economic systems, among others.

Within each organizational type in each ecological framework, agricultural systems differ in degree of intensity. Intensity means the total of inputs to and outputs from each unit of land, and can be measured in terms of calories of energy. The most general trend in the development of agricultural systems is an interaction between population and intensification. Within the framework of a system, population builds up and intensification increases until it reaches its internal limits of sustainability. At that point the system either changes to permit still further intensification or it collapses.

Contrasting Ecologies

The difference between Old World and New World agricultural ecologies lies in the different ways they renew soil fertility. In long-fallow systems worldwide, such as swidden agriculture, this is accomplished by natural organic processes of plant growth and decay. By planting a field that has lain fallow the farmer brings the crops to the accumulated fertility. In short-fallow systems, by contrast, fertilizer must be brought to the crops. In Old World systems, this is accomplished with domestic animals, mainly ungulates. By converting parts of the crops the farmer cannot use into materials and foods that he can use, the animals reduce the total cropped area needed while their manure restores fertility. They provide additional organic material by the common practice of grazing beyond the farmed area in the day and returning at night. A variant of this system, important in Africa where the tsetse fly makes it impossible to keep cattle in fixed locations, is a symbiotic relation between mobile herders and sedentary farmers in which farmers allow the herders to graze cattle on their stubble in exchange for the herder keeping the cattle overnight on the farmer's land.

New World agricultural ecologies do not incorporate domesticated animals and hence have no manure cycle. Instead, fertilizing materials are generally brought to the fields by some form of water transport. This is done in two main ways: with water collection and with *chinampas*, floating beds in lakes and swamps. Water collection mainly involves either waterborne silt from rivers carried in irrigation channels

or flow from volcanic ash fields or eroding rocks. Although New World farmers recognized the value of organic methods such as fish buried with the seeds, these generally demand too much labor to use on a large scale.

Lacking all but a few domesticated animals, like llamas and guinea pigs, there were relatively few places in the New World where humans could depend wholly on agriculture, and those were surrounded by large areas where societies continued to be organized for hunting and gathering—sedentary pockets surrounded by mobile raiders. By contrast, agricultural communities of the Old World spread into much more of the total landscape, settled it more densely, and consistently obliterated the hunting and gathering communities that remained in between their settlements. This difference had important consequences for the way their respective organizational systems developed.

Old World

Settled communities cultivating wild plants first appeared in the Old World about 10,000 BCE. Domesticated versions of these same wild plants first appeared in such communities around 7000

BCE, in the “fertile crescent” around the Jordan valley and on the flanks of the nearby Taurus and Zagros mountains; they included emmer and einkorn (ancient varieties of wheat), barley, lentils, chickpeas, pea, bitter vetch, and flax. Domesticated animals appeared shortly thereafter: sheep, goats, humpless cattle, horses, and pigs. The presence of domesticated plants necessarily implies that farmers are planting each new crop from seeds harvested previously. Once this practice is established the crops can be spread into wholly new areas and evolutionary change can occur rapidly.

Agriculture spread by both diffusion of ideas and cultigens from group to group and by the migration of whole groups, with migration apparently the most prominent of the two processes. Domesticated crops reached the Balkans in the seventh millennium BCE, brought by immigrants. Farming villages appeared in southern France by 5000 BCE. Beginning about 5400 BCE agricultural villages of a distinctive culture called Bandkeramik spread from the area of Hungary to the Netherlands. The first agricultural settlements in South Asia appeared in the beginning of the seventh millennium BCE in what is now southern Afghanistan, with a Middle Eastern mixture of crops and animals. However, roughly contemporary agricultural

FRED HARVEY.

settlements in the Vindhyan Hills, just south of the Ganges plain, grew rice. Agricultural communities appeared in the Yangzi (Chang) valley in China from 7000 to 5800 BCE, growing rice in the lower part of the valley and millet in the upper. The millet was domesticated; it has not been determined whether the rice was. Domesticated grains appear much later in Japan and Southeast Asia, but in the former case, at least, this is because of the importance of tubers, particularly taro.

The archaeological remains of these early communities are consistent with peasant/household organization: small unwalled hamlets or villages with houses either adjoining or separate, with storage pits or areas and, sometimes, ceremonial areas. There is typically little evidence of social stratification, but there are usually burial practices that suggest that the presence of one's ancestors implied entitlement to property. Taking into account ethnographic analogies, the configurations generally suggest a three-tier organization based on household, village, and various forms of kinship based on organization generally described as "tribal." Households, probably often connected to each other by kinship, farm their own plots of land with village agreement and cooperation. Groups of villages recognize themselves as affiliated and are mutually supportive but lack any formal overriding structure.

Large agriculture estates first appeared about 3000 BCE, along with city-states, bronze tools and weapons, large-scale irrigation, and the first forms of writing. It took the form of a hereditary military aristocracy and an at least partially hereditary priesthood, each of whom had specific governmental powers, and large estates set aside to support those powers. Sumerian records describe large-scale "grain grinding households" and "weaving households," associated with the "patrimonial sovereign" and the temple, producing textiles and foodstuffs (Gregoire 1992, 225). They used corvée labor (unpaid) drawn from the peasants, and the accounts show that it was the responsibility of the temple and palace to provide for their maintenance while they were working. The *Iliad* describes Agamemnon as maintaining a similar establishment,

but using the labor of slaves taken in war. Conflicts between city-states led to ever fewer and ever larger alliances, and by 600 BCE this process ended with the transition to imperial systems, in which the conquering power no longer sought the destruction of the opposed city-states but rather sought to subordinate them in a larger hierarchy of command and privilege.

The South Asian chronology was similar. The Indus Valley civilization, beginning around 2300 BCE, was a uniform and well-organized peasant society in which communities cooperated as part of a single system. It collapsed in about 1790 BCE, however, after an earthquake diverted one of the two main rivers it was built on upon. The population apparently dispersed into surrounding areas, particularly the Ganges plain, retaining agricultural continuity but losing social cohesiveness. In the Ganges valley, there were no fewer than sixteen walled cities by 600 BCE, engaging in mutual conflict comparable to that of the Mesopotamian city-states. By 321 BCE, this conflict had led to the establishments of the Mauryan Empire.

In China, walled cities appeared with China's first dynasty, the Xia, and continued into the succeeding Shang (1766–1045 BCE). Beneath the Shang monarch as a general hereditary overlord were large numbers of local rulers holding hereditary title, the first form of the Chinese distinction between the peasantry and the privileged gentry.

All of the imperial systems involved some mixture of elite extraction from peasant production side by side with large-scale enterprises under direct elite control, usually operated with unfree labor. The pattern persisted when the Asian empires were absorbed into European colonial systems. Before then, however, there was a development that was to have fundamental long-term implications for the way the different imperial systems evolved and interacted: the development of democratic constitutions at the city level.

The central aim of the Roman idea of a republic was to find a way to balance the interests of the peasant agriculture of the *plebes* with the elite agriculture of the *gentes* in a single political system that

guaranteed security for all. The solution was carried to the many Roman colonies in the territories that the republic conquered. It persisted in the form of their civic constitutions after the empire collapsed and evolved as these Roman enclaves evolved into towns of the various European nationalities we recognize today. But in the course of this evolution there was a radical realignment of interests. Where the original Roman senatorial fortunes were based on elite agriculture utilizing land taken in war, Renaissance fortunes were based on commerce. Their interests, therefore, no longer supported imperial power and opposed independent peasant farmers but the reverse.

Outside of what had been Roman Europe—in Russia, South Asia, Southeast Asia, China, and Japan—towns remained under the control of the imperial authorities, a situation that supported elite agriculture. The consequence was that the peasantry often had no way to avoid serfdom, and there was no one to serve as the kind of independent engine of technological innovation that led Europe first to expand trade, then to destroy feudalism, and finally to industrialize.

Although programs for land reform that began in the late eighteenth century were aimed at freeing peasant agriculture from accumulated elite impositions, these were not notably successful outside the West. The Communist revolutions in Russia and China replaced whatever autonomous peasant organization remained in their respective areas with collectivization as a new form of elite control, at significant cost in lives and productivity. Since World War II, however, colonial empires and the Soviet Union have been dissolved, and the newly emergent nations have tended toward agrarian reforms that favor peasant/household management. At the same time, the green revolution and related developments in agribusiness have made available to peasant/household production far more productive varieties of plants and animals, producing a “neo-technic” form of peasant agriculture integrating household management with large-scale organizations for economic and technical support that was formerly unavailable.

New World

In the New World one cereal crop stands out as far more important than all others: maize. The earliest known domesticated maize was found in a dry cave in the Tehuacán Valley of central Mexico and dates to about 5000 BCE. But it was far different from what the grain is now and far less productive and useful than the first domesticated Old World grains. Although clearly showing the hallmark of domestication—that the husk surrounded the entire ear and not the individual seeds—the ears were less than an inch long. Evidence of purposeful cultivation appeared about 1,500 years later in the same area, by which time maize was accompanied by beans, squash, chili, gourds, and amaranth. By 1500 BCE the Tehuacán maize was notably improved in both yield and nutritional quality, but even before then it had spread to other areas. Maize found in Bat Cave on the Colorado Plateau has been dated to about 2100 BCE. Small communities practicing irrigated agriculture appeared in the American Southwest by 300 BCE. Larger villages, or *pueblos*, with extensive canal systems and terraced fields appear about 500 CE, including those of the Anasazi, whose descendants appear to include the modern Hopi and the Hohokam whose canals can still be seen in the city of Phoenix. In eastern North America domestication of local plants (marsh elder, sunflower, chenopods, and cucurbits) began about 1500 BCE. Maize appeared about 600 CE, but since rainfall there is generally adequate without irrigation it did not dramatically influence the size of population concentrations.

Generally, agriculture north of the Valley of Mexico depended on peasant/household production. Based on known historic patterns together with archaeological evidence, it can be stated that the key organizational units were household, clan, and village. Land ownership rested mainly with clans. Households farmed on the basis of clan rights. Clan rights were in turn supported by local consensus among councils of clan representatives. A village ceremonial hierarchy, staffed on the basis of clan prerogatives, controlled the annual cycle of activities, which included key agricultural dates.

Nearby farmers' markets sell produce grown on small holdings—parcels of less than 50 acres, for lease or rent—north of Rio de Janeiro, Brazil.

The largest urban populations in the Mexican area were in the sites of original domestication, beginning with the Olmec civilization (1200 to about 400 BCE) and continuing through Teotihuacán, the Valley of Oaxaca, the Toltecs, the Chichemics, and the Aztecs. Although we know little about the Olmec organization, from Teotihuacán on it seems clear that in these states the relation between urban elite and the peasantry in the villages was not that between a populace and their specialized leaders and defenders but rather between conquerors and conquered, seemingly reflecting a takeover by a tribal group who converted themselves into a militaristic ruling class. The elites imposed heavy levies of produce, labor,

and eventually sacrificial victims and concentrated on building enormous ceremonial centers representative of an ideology intended to perpetuate their rule. They engaged in large-scale manufacture and apparently long-distance trade. They did little, however, for those they subjugated. There was, for example, no really large irrigation system in the region, such as could not have been built by the local communities alone. There was also nothing that could be construed as state support for private commerce, such as harbor facilities, inns, or even coinage. In this area the populations of the principal ceremonial centers rose and fell with the power of the group that built them, rather than persisting through a succession of rulers. Teotihuacán,

for example, had an estimated population of 200,000 in 500 CE but was abandoned forever around 750 CE, after a fire. The population of the villages, by contrast, seems to have built up fairly steadily.

The pattern in the northern Andes and the adjacent Pacific coast was similar. Beginning around 1200 BCE local communities practicing irrigated agriculture developed in river valleys in the mountains and on the coastal plains. Through local conflicts these built up into a succession of progressively larger and more militaristic states: the Chavin, the contemporaneous Moche and Nazca, the Chimú, and finally the Inca, based in Cuzco, who established their dominance in the 1470s. The Inca demanded two-thirds of all production and large corvees of labor to build huge road systems, storage facilities, and extraordinary mountain cities with terraced fields that could not possibly have paid for themselves in economic terms. Manufacture of cloth goods and utilitarian and craft objects was organized and standardized on a large scale. When groups under pressure from the Inca fled to avoid conquest, the Inca sent colonists to replace them. When Pizarro arrived in 1532 and captured the ruler, the system collapsed.

The Mayan civilization of the Yucatán peninsula was different only in that the Mayan elite seem to have been indigenous, and they actually did perform functions crucial to productivity. Mayan civilization appeared essentially complete in the archaeological record about 2000 BCE and persisted continuously until the middle of the fourteenth century, when it collapsed in a series of civil wars and the areas were depopulated. The population centers were temple and palace complexes surrounded by many small hamlets and large areas of a type of *chinampa* technology.

When Europeans arrived Old World agriculture arrived with them, but the pattern differed in English-speaking and Spanish-speaking areas. In the former most of the management was peasant/household, and because Old World peasant agriculture supported far higher population densities than New World peasant agriculture, it completely displaced the latter wherever the two systems competed for land.

In the Spanish-speaking areas, by contrast, the main Old World management pattern was elite and

the management system displaced was therefore its New World counterpart, leaving the peasant systems more or less as they were. The most extensive result was the “latifundia/minifundia” situation of large European-owned haciendas, mission estates, and other elite enterprises being laid over indigenous villages in which the villagers retained rights to carry on with their own subsistence agriculture but were also subject to demands to perform work for the larger unit.

Old World agricultural ecologies are now clearly dominant in the New World as well as the Old. Yet New World technology persists in a wide range of environmental niches that Old World agriculture has not been adapted to: the Hopi mesas with eight inches of annual rainfall, Mexican milpas whose owners rely on traditional maize as a low-cost subsistence base, the high Andes, and the Amazon rain forest.

Industrial Agriculture

Industrial agriculture responds to the higher levels of per-capita output permitted by the industrial revolution. Ecologically, it breaks up the animal-plant interdependence at the farm level by separating animal production facilities from crop production, providing manures from industrial sources, and requiring farmers to produce to industrial specifications rather than consumer preferences. Organizationally, it makes farm management part of the system of factory production, replacing inter- and intra-household relationships and elite prerogatives with relations based on commercial contracts between farmers and industrial organizations. At the extreme, in areas such as California’s Imperial Valley, farmers are not landowners of any kind. Corporations own much of the land, and farmers are contractors who agree to produce the desired crop for delivery at a specific time. The farmer may own a core of farm machines, will hire whatever additional inputs are needed to produce the crop, and then move on to the next contract.

Industrial agriculture is highly specialized. The on-farm population of the United States is now 2.5 percent of the total population, but it is supported by people in rural and urban areas engaged in agricultural finance, storage, primary processing, government,

This illustration is from a Qing-dynasty version of *Gengzhi tu* (Pictures of Tilling and Weaving, first printed in 1210), a series of twenty-three scenes celebrating the development of farming technology in the Song dynasty (960–1179).

trade, transport, research, and education who make up not less than 20 percent of the total. When this entire group is taken as the unit for comparison from one society to another, it is easier to see how industrial agriculture arises and to avoid overstating the contrast between agrarian and industrial society.

Current Trends

The relative importance in the world agricultural economy of peasant/household and industrial production is now increasing while elite agriculture is in decline, but both modern peasant/household farming and industrial farming pose challenges. The green revolution's reliance on increased chemical fertilizers and pesticides has led to serious water, air, and even

oceanic pollution. The main hope for reducing such damage while still increasing yields rests with our increasing ability to modify plants by transferring genes from other species. But several types of destructive business practices associated with the firms that have pioneered the commercial development of this technology have exposed serious deficiencies in the way current law addresses the interests of the great mass of agriculturalists and agricultural stability. Efforts to correct them have been going forward very slowly.

Akbar

(1542–1605)

RULER OF MUGHAL INDIA

Reigning for nearly fifty years, Akbar was one of the most important emperors of the Mughal Empire (1526–1857). Though his final years were spent trying to reconcile with a rebellious son, Akbar's intelligence and good judgment during his rule established the Mughal form of governance that would exist for the next three hundred years.

Abu-ul-Fath Jalal-ud-Din Muhammad Akbar was the greatest emperor of the South Asia-based Mughal Empire (1526–1857). Over the course of a forty-nine-year reign (1556–1605), Akbar proved himself a brilliant general, shrewd politician, able administrator, and generous patron of the arts. Akbar's energy and acumen placed the Mughal Empire on firm foundations and created a template for Mughal imperial governance that survived almost unchanged until the early eighteenth century.

Born in 1542 in Umarkot in Sind (in present-day southeastern Pakistan), Akbar was thirteen years old when he succeeded to the imperial throne following the premature death of his father, Humayun (1508–1556). Over the next four years, Akbar slowly extended his political control across Hindustan—the geographical and agrarian heartland of northern India. In the 1560s Akbar asserted his authority over the regions of Malwa (1561), Gondwana (1564), Rajasthan (1568–69), and Bundelkhand (1569) in central and northern India. In the following decades, his military campaigns extended imperial rule to Gujarat (1572–1573) in the west, Bihar and Bengal (1574–1576) in the east, Kabul (1585, in present-day Afghanistan), Kashmir (1586), Sind (1591), and Orissa (1592) in the south-east, Makran and Baluchistan (1594, in present-day

Pakistan), Kandahar (1595, in present-day Afghanistan), and Berar, Khandesh, and parts of Ahmadnagar (1595–1601) in the Deccan.

Akbar's expansionist military goals found a complement in equally vigorous attempts to co-opt or destroy alternative loci of power. Thus, between the early 1560s and 1581, Akbar succeeded in crushing a host of rivals within his own extended Mughal clan. Among them were the distantly related Mirzas (early 1560s) and his half-brother, Mirza Hakim (1581). Akbar also asserted his power over the fractious Mughal nobility in a multipronged process that unfolded between the 1560s and the 1590s. He broke the power of entrenched Turkish and Uzbek clans that served under his father; diversified the ranks of the Mughal nobility by recruiting from alternate groups such as Indian Muslims, (Hindu) Rajputs, Afghans, and Persians; fashioned elaborate rules of conduct emphasizing discipline and loyalty to the Mughal Empire; and emphasized both his divinely ordained right to rule and (more controversially) his own semi-divine status. The most important tool in Akbar's attempts to control the nobility, however, was the *mansabdari* system implemented after 1574–1575. Within the *mansabdari* system every nobleman was assigned a *mansab* (rank) that comprised two separate grades: the first denoted a nobleman's personal status and the second indicated his obligation to recruit and command a certain number of cavalry for imperial service. A *mansab* holder's financial needs were satisfied by the state through assignments of nonhereditary and nontransferable land grants that were rarely retained for more than three years.

Akbar targeted the powerful Islamic religious establishment after the 1570s. He did this in several

Emperor Akbar Hunting with Cheetahs (c. 1602), from the *Akbar Nama*, an account of the emperor's life.

moves. He reformed the system of state-issued land grants that provided the religious community with financial support; he asserted his own power of judgment over doctrinal decisions and diminished the importance of the head of the judiciary—who usually also served as chief spokesperson for the religious establishment—within the Mughal administrative framework. He exiled—and occasionally murdered—religious opponents and promoted the Sufi orders as a counterpoint to the orthodox religious establishment. He also evolved a theory of

universal kingship that obligated the emperor to favor all his subjects equally, regardless of their religious affiliation. Accordingly, Akbar ended the practice of forcibly converting non-Muslim prisoners of war to Islam and lifted various discriminatory taxes on Hindus; his most significant gesture came in 1579 when he abolished the poll tax, or *jizya*, on non-Muslims. Although the Islamic establishment generally opposed Akbar's religious initiatives, it was forced to accept the new dispensation after a massive religiopolitical revolt against Akbar was crushed in 1581. Akbar's reformist agenda largely survived until its reversal during the reign of his great-grandson, Aurangzeb (reigned 1658–1707).

After the 1560s Akbar moved to transform the *zamindars* (superior landholders) into a quasi-official service class. Control over the *zamindars* was important to Akbar as they gave him access to the agrarian wealth that paid for the Mughal imperial enterprise. The *zamindars* were notoriously refractory, and gaining their monies invariably involved time-consuming political negotiations, but Akbar crafted a new arrangement. He had the *zamindars* collect from the peasants the required revenue—which the state determined through a highly sophisticated system of measuring cultivated lands and calculating average prices and yields over the previous ten years—in return for which service the *zamindars* retained their claim over the land and between 10 and 25 percent of the revenue they collected. The presence of imperial revenue officials, accountants, and Mughal military contingents in the countryside provided a crucial check on the ability of *zamindars* to obstruct the will of the Mughal state.

Besides remarkable military and political achievements, Akbar's reign witnessed tremendous cultural and artistic accomplishments. Massive imperial patronage for Persian poetry, historical writing, and translations of Hindu scriptures into Persian were accompanied by the creation of new schools of art and architecture that successfully blended Persian and Indic styles, techniques, and themes. Some of the finest examples of Mughal miniature painting

The Mughal emperor Akbar was renowned for his intelligence and good judgment.

(like the illustrations for the *Akbarnama*) and architecture (seen in Akbar's short-lived imperial capital at Fatehpur Sikri) date to this period. The long-lasting influence of Mughal art and architecture is best attested by the continuing attempts in South Asia to emulate their fine sense of balance and proportion

long after the Mughal Empire had collapsed in the early 1700s.

Akbar's last years were clouded by the rebellion of his eldest and formerly favorite son, Salim, between 1599 and 1604. Ultimately, their partial reconciliation paved the way for the succession of Salim—as Emperor Jahangir—following Akbar's death in October 1605.

Aksum

Aksum was the capital of an important kingdom in northeast Africa, including most of what is now Ethiopia, during the first millennium CE. With a mix of African, Mediterranean, and southern Arabian cultures, it was also the religious center of the earliest Christian state in Africa.

At the peak of its power in the fourth and fifth centuries, the African capital of Aksum ruled an empire that extended from Kush in the modern Republic of Sudan to Saba (Sheba) in Yemen and included much of contemporary Ethiopia, Eritrea, and Somalia. It is understandable, therefore, that the third-century Iranian religious leader Mani ranked Aksum with Rome, Persia, and China as one of the four great empires that divided the inhabited world among them.

Sources of Aksumite History

Although Ethiopia has an extensive literature, it provides little information about historical Aksum, emphasizing instead the legend that the kings of medieval and modern Ethiopia were the lineal descendants of Menelek (late tenth century BCE), the son of King Solomon and the Queen of Sheba, who reigned at Aksum until being exiled by usurpers in the early Middle Ages. The principal sources for the history of ancient Aksum, therefore, are Aksumite royal inscriptions and coins, references to Aksum in ancient classical and Christian literature, Sabaean inscriptions, and archaeology. The most important of these sources are the royal inscriptions, which Aksumite kings set up to commemorate their victories. These inscriptions are written in Greek and two Semitic languages—Geez

and Sabaean—and provide important information about Aksumite government and foreign relations. Aksum also issued the earliest native African coinage, which provides the only evidence for the existence of several Aksumite kings. In addition, classical and Christian literature frequently mentions Aksum because of the important role it played in late Roman and early Byzantine foreign policy and commerce in the Red Sea basin. After Aksum ceased to be the royal capital in the early Middle Ages, the city fell into ruin. Archaeological exploration of the ruins of Aksum, which began only in the twentieth century, is providing important evidence for the origins and early history of the city.

This is the largest standing monolith in Aksum's field of stelae, a site that includes some of the most spectacular monuments of the ancient world. Photo by John Watson.

Aksum and Its Neighbors

The early history of Aksum is obscure. Although there is archaeological evidence for incipient state formation in Ethiopia as early as the third millennium BCE, the origins of the Aksumite state date to the first half of the first millennium BCE, when Sabaeen colonists settled in Eritrea and northern Ethiopia. Sabaeen inscriptions and monumental architecture and sculpture attest to the emergence of several kingdoms in the region. Aksumite history proper begins when the rulers of one of these states, the Habasha (or Abyssinians), made Aksum their capital, probably in the first century BCE or the first half of the first century CE, when classical sources refer to the city as a royal capital and important trading center.

Geography was the key to Aksum's growth. Its location high on the Ethiopian plateau gave it ready access to the upper Nile Valley and its hinterlands on the west and to the Red Sea on the east and enabled Aksum to profit from its position astride the trade routes that linked Roman Egypt to northeastern Africa, southern Arabia, and especially India. By the late first century CE, Aksum was the chief commercial center of the southern Red Sea basin. The fact that its ruler at that time was literate in Greek combined with the presence of resident foreign traders in Aksumite territory attests to the existence already of close ties between Aksum and Roman Egypt. Aksumite power grew rapidly thereafter. By the mid-third century Aksum had displaced Kush as the principal supplier of African goods to Rome. With the conquest of Kush and the destruction of its capital, Meroë, by the

A stylized drawing from the 1800s of the ruins of an Aksum palace.

mid-fourth-century king Ezana, Aksumite territory reached its maximum extent. Ezana's conversion to Christianity also strengthened Aksum's ties to Rome, and for the next three centuries Aksum was Rome's principal ally in the struggle to prevent the expansion of Sasanid Persian influence in southern Arabia.

Government and Culture

Little is known about how the Aksumites governed their empire. Aksumite kings styled themselves "king of kings" and listed numerous peoples they claimed to rule in their inscriptions. Combined with references to various local rulers, this suggests that the king of Aksum and his family controlled the central government and military, while local royal families continued to rule the empire's various provinces. The frequent references to rebellions in the sources highlight the difficulties of controlling such a vast and decentralized state. By the early sixth century Aksum had lost its frontier provinces in the Nile Valley and South Arabia, although control of its Ethiopian and Eritrean core territories remained firm. Aksumite prosperity depended, however, on its key role in the lucrative Red Sea and Indian Ocean trade. The disruption of that trade by the Arab conquest of Egypt as well as Syria, Lebanon, Israel, Jordan, Iraq, and Iran sapped Aksum's prosperity and resulted in the gradual decline and ultimate abandonment of the city in the eighth century, when its last kings moved

their capital to a more defensible site in the interior of Ethiopia.

Aksum flourished for over half a millennium, producing a rich culture that created in the great stelae of Aksum some of the most spectacular monuments of the ancient world. Unfortunately, little is known about other aspects of Aksumite culture. Christianity has been the dominant religion of Ethiopia since the mid-fourth century. Conversion to Christianity was, however, followed by repudiation of many of the pagan traditions of Aksum. Thus, although the Geez translation of the Bible and the trilingual royal inscriptions clearly indicate that pre-Christian Aksum had a literary tradition, no Aksumite literature survives. (It is thought that in the abandonment of Aksum as the royal capital, the early manuscripts were lost.) Likewise, only a small amount of Aksumite art, predominantly architectural and numismatic, still exists.

Archaeological evidence indicates that Aksumite culture was a blend of African, Mediterranean, and southern Arabian traditions in which the southern Arabian strand dominated. Thus, the official language of Aksum was Geez, a Semitic language, which was written in an alphabetic script derived from South Arabia. Aksumite architecture followed South Arabian models and the kings of Aksum applied South Arabian hydraulic engineering techniques to ensure a reliable water supply for Aksum. The Aksumites also worshipped South Arabian gods. The most

important of these gods was Mahrem, the war god, who was reputed to be the ancestor of the kings and their helper in battle. Presumably, much Aksumite tradition survives in the Christian culture of medieval and modern Ethiopia, but at present such survivals cannot be identified with certainty.

Alchemy

Often thought of simply as the precursor to chemistry, the study and practice of alchemy actually was part science / part philosophy, ranging into spiritual practices and techniques aimed at transforming the human consciousness. With the ancient goal of discovering life's secrets, alchemists studied the relationship between humanity and nature and the processes by which they were altered.

As it is most commonly understood, alchemy was a medieval scientific and philosophical endeavor with the central practical aim of finding a method for transforming base metals into gold. The primitive exercises in chemistry, however, were only the practical manifestations of a more ancient, quasireligious search for what might be termed the fountain of youth: the alchemist's ultimate quest was to uncover the secrets of matter and of life itself, so that it might be prolonged indefinitely.

Alchemy has long been of interest to historians of science, anthropologists, and a host of other scholars with an interest in the human religious impulse and the shaping of rituals aimed at the transformation of individuals and social groups. It is a topic perhaps best approached from four distinct avenues of inquiry: the first has to do with the etymology of the word; the second concerns its history; the third focuses on both the practice of alchemy and its ideological foundations; the fourth deals with alchemy as a global phenomenon with a set of universal precepts identifiable through cross-cultural comparison. The story of alchemy must, in sum, be understood from a highly nuanced standpoint that takes into account its

complex history and global diffusion. More than just a simple precursor of the modern science of chemistry, it is a way of thinking about the relationship of humanity and nature that emphasizes the importance of transformation in both. It also focuses on the role that human agency plays in mediating the processes by which substances—natural and human—are *transmuted*, or raised to a higher form.

The word *alchemy* enters the English language by way of a long philological journey that parallels, in some respects, the evolution of the practice in the Western world. Its semantic core comes from one of two possible Greek terms: the first, *chymeia*, is a noun denoting something poured or infused. The second, *chêmeia*, is a noun that refers specifically to the transformation of metallic substances. One or the other of these terms was likely the source for the Arabic term *al-kîmiyâ*, which comes into the lexicon of Medieval Latin as *alchimia*, into Old French as *alkemie*, and ultimately into English as *alchemy*.

This linguistic evolution provides some clues as to the origin and spread of the art in Greece, North Africa, and the Near East. Its first flowering is believed to have been in Egypt around 300 BCE, a time when scientific inquiry was in full bloom in the Hellenistic world. Some four and a half centuries later, Islamic scholars adopted the tradition and added to its cosmological conceptions, precepts, and practices; ultimately, it was their stewardship and mediation that enabled it to spread throughout Europe in the fourteenth century CE. Although considered of questionable merit at best by Christian ecclesiastical authorities, alchemy had become a vital part of the European intellectual ethos by the sixteenth and

seventeenth centuries. Many of history's well-known personalities, including, in England, Sir Walter Raleigh, Sir Isaac Newton, and King Charles II, have been favorably inclined toward its esoteric and exoteric dimensions.

Moreover, the symbolism of alchemy has had a profound impact on the literary and artistic traditions of the West. Evidence of its influence can be seen in the work of William Shakespeare, John Milton, Johann von Goethe, John Dryden, Victor Hugo, and William Butler Yeats. Alchemical processes and symbolism have proved to be of enduring interest to scholars, artists, and literati down to the present era. In the twentieth century, they provided the brilliant psychologist Carl Jung with a template for understanding the processes associated with the maturation of the human psyche, and they continue to inform the work of many contemporary Jungian psychoanalysts. The alchemical quest for the so-called philosopher's stone (the substance that would change metal into gold, emblematic of that which is primal and in a state of eternal stasis) and elixir vitae (the potion that bestows boundless health and everlasting life) remains an inspiration to modern religious seekers, some of whom see in them guideposts for the human quest for communion with nature and the supernatural.

Alchemy can be described as a cosmological, philosophical, and metaphysical system that views the created world and everything in it as both vibrant and evolving. For the alchemist, the developmental processes that govern life are not easily discernible without the aid of special insight; it is the aim of alchemy to uncover and chart these hidden dynamics. By so doing, the alchemist would gain the knowledge that makes effective stewardship of the world possible. This includes not simply the ability to be a passive guardian, but the skills needed to engage in proactive intervention that can bring all that has not reached maturation to full flower. Thus, the alchemist is one who understands the processes of nature at an intimate level and has the capacity to use this knowledge to promote cosmic, environmental, social, and individual metamorphosis.

The stock-in-trade of alchemy consisted of observation, the gathering of empirical data, experimentation, and contemplation of the unseen verities that lay behind the phenomena that could be apprehended with the five human senses. Whether couched in terms adapted from Egyptian, Greco-Roman, Islamic, Indian, Daoist, or Christian lore, the overarching goal of alchemy appears to have been relatively uniform: that is, to uncover the forces governing unity, diversity, stasis, and flux in the world. Having mastered them, the alchemist would possess knowledge of the primal element from which all matter was created and the ability to distinguish between the mutable and the immutable, the finite and the infinite.

In time, the art would develop two distinct trajectories. The first was limited to the study of natural processes (chemistry). The second—consisting of alchemy and the allied hermetic disciplines—would be concerned primarily with the esoteric and spiritual dimensions of these processes. In the alchemical lore of the West, the practice is often characterized as a quest for the substance that has the power to perfect that which is incomplete and to make noble that which is base. This element or compound is superior to and prized above all others. It is known by many names, the most famous of which is the *philosopher's stone*. In order to produce it, base matter—whether animal, vegetable, or mineral—must be reduced to *materia prima* (the primary substance). This symbolic death is the precursor for the generation of a new element through coagulation. The process was understood to involve internal and external dimensions, in that an alteration in the alchemist's state of consciousness was expected to accompany the manipulation of physical elements.

A more precise description of the aims, underlying philosophy, and processes associated with alchemy is difficult. Many of the texts produced by its practitioners are written in a manner that veils this information in allegories and symbols, a strategy intended to conceal its secrets from all save those who had been initiated into its mysteries. Some treatises appear to employ an alchemical language consisting of commonly shared and easily intelligible images; these

Emblematic Alchemy in English Verse, with an English version of the Visio Mystica of Arnold of Villanova, by George Ripley and Richard Carpenter. The images here are sections of the nineteen-foot-long “Ripley scroll,” an elaborate illustrated guide to alchemical signs and symbols (c. 1570). Beinecke Rare Book and Manuscript Library, Yale University.

Alchemy can be described as a cosmological, philosophical, and metaphysical system that views the created world and everything in it as both vibrant and evolving. Beinecke Rare Book and Manuscript Library, Yale University.

include the biblical flood (symbolizing dissolution), the pelican (symbolizing the instrument used to distill the *elixir vitae*), the phoenix (symbolizing rebirth), blood (symbolizing mercury as solvent), the egg (the matrix in which the philosopher's stone is made), and the philosophical tree (emblematic of growth and the alchemical process). Others writers appear to delight in confronting the reader with a confusing array of polyvalent symbols that defy precise classification

and bedevil would-be interpreters. Certain alchemical writings remain today virtually inscrutable to even the most highly trained specialists.

Certain universal elements have been identified in alchemical practice across cultures. One particularly attractive view of alchemy's origins was proposed in the mid-twentieth century by the historian of religions Mircea Eliade, who traced them to the rituals and specialized skills of early metallurgists. Eliade believed

*If by fire Of sooty coal th' empiric alchymist Can turn, or holds it possible to turn,
Metals of drossiest ore to perfect gold.* • John Milton (1608–1674)

that these artisans—along with agriculturalists and those who learned to transform moist clay into vessels, bricks, and works of art—were the first to develop an awareness of humanity's ability to make strategic interventions capable of altering the rhythms of nature. Through the use of fire, they could hasten the development of that which grew in the Earth, and shorten the interval of time needed to bring things to perfection.

Over time, this idea was applied to human beings and the cosmos, thereby giving rise to distinct alchemical traditions in Africa, the Near East, Asia, and Europe. The smith came to be seen as a powerful figure, one with specialized knowledge of how to forge tools that could generate life or cause death. Early metalworkers were also viewed as masters of esoteric knowledge related to architecture, song, poetry, dance, and healing. They were peerless makers whose secrets were jealously guarded and passed on through initiatory guilds. In sum, for Eliade the various alchemical traditions known to us from around the world owe their origin, at least in part, to the lore and praxis of the ancient smith.

The modern legacy of alchemy consists of experimental disciplines such as chemistry, as well as those applied sciences aimed at harnessing the Earth's natural, mineral, and other resources. It also consists of spiritual practices and techniques aimed at transforming the human consciousness. Thus, mystical religious traditions (Eastern and Western) as well as psychoanalytic theory are built upon older alchemical foundations. Recognition of the limited and nonrenewable state of many of our global

resources will likely fuel continuing interest in careful observation of the natural world and cultivation of a global awareness of human interconnectedness. By means of such endeavors, future generations may continue to build on and carry forward a rich alchemical heritage.

Alcoholic Beverages

It is probable that all human communities have used mind-altering substances in their rituals of hospitality and spiritual practices. Alcohol has for millennia been the preferred mind-altering substance of the Mediterranean world and Europe. In recent times its use has spread around the globe. Modern states find themselves torn between encouraging the use of alcohol to earn large tax revenues, and banning use due to medical and social problems caused by alcohol abuse.

The word *alcohol* is derived from the Arabic *alkuhl*, which in turn derived from *kuhl*, one of whose meanings is “the essence” or “spirit” of something. To a chemist, the word *alcohol* describes a group of organic molecules with the general chemical formula $C_nH_{(2n+1)}OH$. To non-chemists, the word refers to a group of drinks with mind-altering properties, whose active ingredient (or essence) is ethanol, one of the simplest of all alcohols. The chemical formula for ethanol is CH_3CH_2OH .

Ethanol is most commonly produced as a byproduct of fermentation, a chemical reaction in which energy is released through the breakdown of glucose. But fermentation does not release all the energy locked up in sugars, and when alcohol is consumed, the human body can extract some of this remaining energy at the rate of just over 7 calories per gram of alcohol. This is why small amounts of alcohol can be energizing or relaxing. In larger quantities, above approximately .05 percent in the blood, alcohol acts as a depressant, affecting mainly the brain and nervous system, the way barbiturates and anesthetics do. Even in quite small quantities, alcohol can inhibit

normal thought processes, leading to a loss of social inhibitions that is often experienced as euphoria or release from stress. In extreme quantities, alcohol can incapacitate the nervous system entirely, leading to unconsciousness and even death. At blood level concentrations of more than .4 percent, most people will be anesthetized, and above .5 percent, they may stop breathing.

Earliest Alcoholic Drinks

For historians, it is the social, cultural, political, and economic aspects of alcohol use that are most important. Fermentation is a natural process and can occur whenever substances rich in sugars (including grapes, berries, grains, honey, bananas, palm sap, agave, and even mare’s milk) are left in warm, moist conditions and exposed to the air, so that airborne yeasts can come in contact with them and break them down into alcohol. It is tempting to suppose that alcoholic drinks first became important after the Neolithic revolution, when more and more humans became sedentary and farming communities began to store large quantities of grains or other starchy substances. The archaeologist Andrew Sherratt has argued that, partly on the basis of the spread of drinking vessels, alcoholic drinks in Eurasia first acquired social and cultural significance in Mesopotamia or the eastern Mediterranean from about the fourth millennium BCE, in areas where they could be made from grapes or dates. But alcoholic drinks were not confined to western Eurasia. Maize beers were used in Mesoamerica and Peru; and anthropological studies record their use in many small-scale farming societies in modern times.

Alcoholic beverages, like all mind-altering substances, can carry those who drink them to different psychic places.

Natural fermentation generates drinks of relatively low alcoholic content, anything from about 8 to 14 percent alcohol by volume for wines (grape alcohols) and from 2 to 8 percent for beers (grain alcohols). Concentrations higher than about 14 percent tend to kill yeast, so natural fermentation cannot proceed beyond this concentration. But most traditionally consumed alcoholic drinks probably contained much less alcohol. Weak alcoholic drinks such as kvass (a Russian rye beer) and koumiss (fermented mare's milk, drunk in Central Asia) usually contain no more than 2 percent alcohol, and were often used as a safer alternative to river or pond water, particularly if they had been boiled at some stage in their preparation. Very weak alcoholic drinks were nutritious and safe, and could be consumed by all members of society, including children.

Psychosocial Uses of Alcohol

With care, however, it was always possible to brew stronger drinks, and we have evidence of these from all alcohol-producing civilizations. Stronger alcoholic drinks had much more psychic power and created a complex of opportunities and problems that are common to all psychoactive substances. Alcoholic drinks seem to have been widely used in rituals of hospitality. But their importance went beyond mere hospitality for, like all mind-altering substances, they could transport those who drank them to different psychic places, adding new dimensions to the experience of existence. It is likely that in many alcohol-using societies, such experiences have been conceived of in spiritual or religious terms. The psychologist Carl Jung (1875–1961) once described the craving for alcohol as “the equivalent, on a low level, of the spiritual thirst of our being for wholeness; expressed in medieval language: the union with God” (Jung 1975, 2:623–624). The psychic power of this search was such that all societies have sought to control the use of psychoactive substances. In the case of shamans, the control takes the form of rigorous training in the use of such substances to enable psychic journeys. In village communities in alcohol-using societies, it has taken the form of communal rituals designed to regulate intoxication. The historian George Duby has argued that in the European Middle Ages, drinking festivals aimed “at one and the same time to half-open the gates of the unknowable and to reinforce group cohesion for mutual protection” (Duby 1974, 53). And the pharmacologist and medical historian C. D. Leake (in Lucia 1963, 6) argued that

Generally, the use of [alcoholic drinks], which were thought to have magical powers, became socially and ritually controlled. Under these circumstances, whatever excesses might occur were indulged in by all the group, so that there remained a sense of social unity. The ritualistic use was often part of the organized religious services which tended to bring the group together in a common experience and to relate the

group more satisfactorily to its environment and its members to each other.

The psychic power of alcoholic drinks and the ease with which they could be produced ensured that alcoholic drinks became part of the very texture of rural life in all areas where they were produced. They played important roles in ritual and social occasions, they sealed commercial transactions, and they were used to treat the sick and anesthetize those in pain or to encourage those entering battle. Particularly in ritual contexts, their use often became obligatory; even those who preferred to do without them risked becoming social outcasts if they refused to drink at major ritual occasions such as religious festivals or marriages and funerals. However, in urban areas, where individuals were less subject to the control of their families, individuals were more likely to drink at will, so it is perhaps not surprising that the earliest evidence of individual rather than collective drunkenness seems to come from cities in ancient Egypt and Mesopotamia.

Increasing Potency: Distilled Alcoholic Drinks

Distillation makes it possible to raise the concentration of alcohol, creating alcoholic drinks of greater psychic and social potency. Distillation exploits the fact that alcohol has lower boiling and freezing temperatures than water (respectively 78.5°C and -114.1°C). In extremely cold climates, it is possible to distill by leaving fermented drinks out in the cold. Because water freezes before alcohol, the concentration of alcohol can be increased simply by throwing away the ice and repeating the process several times. However, most distillation exploits the different boiling points of water and alcohol. Fermented drinks are boiled and the steam that results is condensed in a separate container. Because alcohol boils sooner than water, the condensed liquid has a higher concentration of alcohol than the original liquid; each new condensation raises the concentration of alcohol. Though rudimentary forms of distillation may have existed earlier, the first pot stills were apparently used by Islamic

alchemists about 1,000 years ago to distill grape wine, which is why some of the technical vocabulary associated with alcohol is of Arabic origin. Alchemists originally treated distilled wine as a medicine, but from the later Middle Ages it began to be used for recreational purposes in parts of western Europe. Modern industrial distillation is based on techniques of fractional distillation, in which the alcohol-bearing vapors rise through a series of plates, each containing already-condensed vapor. At each plate, some of the water in the rising vapor condenses, while some of the alcohol in the condensed liquid vaporizes. The effect is similar to multiple redistillations.

Technically, distillation is significantly more complex than fermentation, and it needs to be handled carefully if the resultant drink is not to contain significant quantities of poisonous byproducts. This is why, though wines, beers, and meads were produced in many peasant households, distilled drinks generally required specialist production and were more commonly traded through commercial networks. Because they were harder to produce at home, it was also easier to tax distilled drinks once consumers acquired a taste for them. And their superior potency ensured that, once introduced to them, consumers usually took to distilled drinks with great enthusiasm.

Psychoactive Revolution

The production and spread of distilled liquors in recent centuries count as a significant part of a global change that the historian David Courtwright has described as the “psychoactive revolution”—the sudden availability through commercial channels of an unprecedented variety and quantity of mind-altering substances. “People everywhere have acquired progressively more, and more potent, means of altering their ordinary waking consciousness. One of the signal events of world history, this development had its roots in the transoceanic commerce and empire building of the modern period—that is, the years from about 1500 to 1789” (Courtwright 2000, 2). As more and more rural dwellers migrated temporarily or permanently to the towns and became more and

This illustration of an early-twentieth-century industrialized distilling plant is inset with a picture of a traditional, rural Irish counterpart.

more entangled in the commercial networks of the wider world, and as alcoholic drinks became more varied and more available, the controls on consumption that had operated in most communities began to break down. Often, too, mind-altering substances, including alcohol, were introduced to communities with no experience of their use, often with devastating results. From North America to Siberia and the Pacific Islands, European traders found that alcoholic drinks had peculiar potency in societies unused to them and rapidly created new forms of addiction and dependence. Though their use often proved extremely destructive to traditional cultural norms, merchants and officials continued to supply them because they provided such powerful commercial and political leverage. Alcohol played as potent a role as guns and diseases in the building of European colonial empires.

Because of alcohol's damaging effects, states have played an increasingly important role in its regulation. Yet states have also earned significant revenues from the increasing trade in alcohol and other psychoactive substances. And it is this deeply ambiguous relationship between modern states and the trade in alcoholic drinks that explains why most modern states have been torn between prohibition (in vain attempts to maintain public

order) and the sale of alcoholic drinks (in the hope of controlling consumption while simultaneously generating significant revenues). Indeed, states became addicts as well as individuals. In Russia in the nineteenth century, close to 40 percent of government revenues came from the sale of alcoholic drinks, which was enough to pay most of the expenses of the army that made Russia a great power. In nineteenth-century England, alcohol generated a similar share of government revenue. Indeed, most modern states have depended on revenues from mind-altering substances of some kind, so it is no wonder that no modern state has succeeded in entirely banning their consumption. On the contrary, alcoholic drinks have now spread around the entire world, so that today they may be the most widely traded and most widely consumed of all mind-altering substances.

Alexander the Great

(356–323 BCE)

KING OF MACEDONIA

The structure of culture and politics in part of Asia was forever changed by the impact of Alexander, king of Macedon in the fourth century BCE. Ruling for over a decade, he succeeded in many conquests that resulted in the end of the Persian Empire and the establishment of a multistate system. Though he is called “the Great,” historians often debate whether Alexander’s impact was positive or negative.

The thirteen-year reign (336–323 BCE) of Alexander III of Macedon fundamentally changed the political and cultural structure of ancient southwestern Asia. The Persian Empire, which had ruled the vast region from the Mediterranean to the borders of India, disappeared in 330 BCE as the result of

Alexander’s conquests, replaced by a new multistate system dominated by Macedonians and Greeks. The region’s center of gravity shifted westward from its ancient focus in Mesopotamia and southwestern Iran to the shores of the Mediterranean and Greece, and Greek culture replaced the ancient cuneiform tradition as the culture of its elite. At the same time diplomatic and commercial ties were established that eventually linked together the civilizations from Europe to China.

Alexander was born in 356 BCE, the first child of Philip II (360–336 BCE) of Macedon and his principal wife, Olympias. He was raised in keeping with his status as Philip’s heir, being educated by the philosopher Aristotle and trained by his father for his role as king and the commander of the Macedonian army.

The Alexander Mosaic (c. 100 BCE), originally a floor mosaic in Pompeii’s House of the Faun, depicts The Battle of Issus, part of Alexander’s famed “Greek Crusade.”

A detail of the *Alexander Mosaic* shows “the Great” leader, whose indelible impact—whether positive or negative—is still a subject of debate among historians.

When he succeeded his father as king in 336 BCE, Alexander was ready to continue the invasion of the Persian Empire, which had been begun by Philip. Alexander devoted the first two years of his reign to consolidating his hold on power. Rapid campaigns in the northern Balkans and Greece headed off rebellions by Macedon's Greek and non-Greek subjects and secured his appointment as *hegemon* (“leader”) of the Corinthian League and commander in the war against Persia. With his power base secure, Alexander crossed into Asia in spring 334 BCE at the head of an army of approximately 35,000 men.

During the next decade Alexander campaigned as far as western India before being compelled by a mutiny of his army to return to the west, where he died in Babylon in June 323 BCE. This remarkable campaign divides into three distinct phases. The first phase, which lasted from 334 BCE to 330 BCE, is known as the “Greek Crusade” and was marked by the great set battles of Granicus, Issus, and Gaugamela and climaxed with the destruction of the Persian capital of Persepolis and the assassination of the Persian king Darius III by his own officers. The second phase, which lasted from 330 BCE to 327 BCE, saw Alexander

adopt various aspects of Persian royal ceremonial and practice despite Macedonian and Greek opposition in order to attract Iranian support in the face of fierce guerrilla resistance in Central Asia. The third and final phase of the campaign began with the two years that Alexander spent in India and ended with his disastrous return to the west through Baluchistan and his death in Babylon, while planning further campaigns, beginning with an invasion of Arabia.

Historians' interpretations of Alexander's spectacular reign vary widely for understandable reasons. There are few primary sources for the period. Of the many accounts written by his contemporaries and the numerous documents issued by his government such as existed, only fragments and a few inscriptions survive. Therefore, historians depend on five Greek and Latin biographies of Alexander written between the mid-first century BCE and the second century CE for their information. Also lacking are sources that reflect the perspectives of the Persians and the other peoples Alexander encountered. As a result, while the outline of his career is clear, widely divergent theories have been proposed concerning Alexander's ultimate goals, ranging from the popular

True contentment depends not upon what we have; a tub was large enough for Diogenes, but a world was too little for Alexander. • **Charles Caleb Colton (1780–1832)**

pre–World War II belief that he wished to realize the philosophical dream of the unity of all mankind to the contemporary view that Alexander was a vicious conqueror with no goals beyond glory and personal aggrandizement.

The sources are only part of the problem, however. Equally important is the fact that Alexander died before he could develop a final plan for the governing of his empire. Instead, he improvised various solutions to the administrative problems that arose during the course of his campaigns. Thus, while he became more and more autocratic, which was encouraged by his belief in his semidivine status as the “Son of Ammon,” and he continued his efforts to supplement the limited Macedonian and Greek manpower available to him by encouraging collaboration by native elites, neither development had been institutionalized at the time of his death. Paradoxically, therefore, Alexander’s principal contribution to history was essentially negative: he destroyed the Persian Empire and with it the state system that had dominated ancient southwestern Asia

for two centuries. It would be left to his successors to devise a new state system to replace it.

al-Khwarizmi

(c. 780–c. 850)

ARAB MATHEMATICIAN

Sometimes called the “father of algebra,” al-Khwarizmi dedicated his life to the research of mathematics. His in-depth study of numbers would eventually result in the present-day use of Arabic numbers in all mathematical applications, from algebra and geometry to the production of maps.

Al-Khwarizmi was a Muslim astronomer, geographer, and, most importantly, a mathematician. He was born in the Persian town of Khiva, in what is now Uzbekistan. His full name was Abu Abdullah Muhammad ibn Musa al-Khwarizmi. His family name was the term *algorithm*, and one of his books, *Hisab al-Jabr wal-muqabalah*, was the origin of the word *algebra*.

In his youth, al-Khwarizmi’s parents moved from Persia to Iraq and settled in the bustling city of Baghdad. In Baghdad, young al-Khwarizmi was attracted to the Bait al-Hikmah (House of Wisdom), an institution where literary scholars, philosophers, natural scientists, mathematicians, and medical doctors from around the region worked on ancient Greek texts. Later, Muslim scholars passed this wonderful body of knowledge to Europe, where it sparked the Renaissance. Al-Mamun (786–833), the caliph of Baghdad, who had founded the House of Wisdom in 830, patronized its scientific research. Al-Khwarizmi dedicated some of his works to the caliph in gratitude for the caliph’s having made available to scholars the first and best library since that of Alexandria.

Al-Khwarizmi investigated numbers far more deeply than did anyone in the European medieval world. His study of structures, surfaces, pyramids,

A page from al-Khwarizmi’s treatise on algebra, *The Compendious Book on the Calculation by Completion and Balancing* (c. 240).

cones, circles, and triangles took mathematics and algebra to new heights. It was al-Khwarizmi who revolutionized the use of math in arithmetic, algebra,

Let no one enter who does not know geometry. • **Inscription on Plato's door (c. 427–c. 347 BCE)**

and geometry. Interestingly, his original and innovative use of advanced math was used to help solve the problems occasioned by the complex Islamic laws of inheritance and divisions of estates and assets among brothers and sisters at the death of their parents.

This “father” of algebra and algorithms conducted lifelong research on the Hindu numerical system and the Hebrew calendar, and he studied ancient Egyptian sundials and Syrian texts. He derived new concepts and consolidated others relating to Arabic numerals and zero as well as to the decimal system. The world's first correct astronomical tables and explanation of the movements of the sun, the moon, and the five planets closest to Earth were the works of al-Khwarizmi. He also had a superior sense of world geography and wrote a book on the topic, *Surat al-Arz* (Shape of the Earth). At the suggestion of al-Mamun, he oversaw a team of sixty-nine and produced the first correct world map in world history. This too was done to solve a practical problem: Muslims around the world needed to know what direction to face (namely, toward the Ka'ba in the city of Mecca, Saudi Arabia) to offer their daily obligatory five prayers. Thanks to the

efforts of al-Khwarizmi and others, this problem was solved by finding the shortest arc of the great circle anywhere on the globe between a person's location and Mecca.

The world stands in gratitude to al-Khwarizmi for the use of Arabic numbers, decimals, and the value of zero in math, algebra, geometry, and trigonometry, and for the production of correct world maps.

Although al-Razi (c. 865–c. 925 CE) was an Islamic philosopher whose unorthodox ideas earned little credence among Muslims of his day, his free thinking and, most importantly, his role as a physician made a significant contribution to world history. His work, and especially his translations, provided an important connection between ancient practices and physicians during medieval times, and in the development of current-day Western medicine.

Abu Bakr Muhammad ibn Zakariya' al-Razi, also known to Europeans by his Latinized name of Rhazes, was one of the most influential Islamic physicians of the pre-modern era. Razi's contributions have been favorably compared to those of such early physicians and scientists as Hippocrates (c. 460–c. 377 BCE), Galen (129–c. 199 CE), Ibn Sina (980–1037), and Vesalius (1514–1564). Razi's works were widely used throughout medieval and Renaissance Europe. His translations and original works provided a critical link among ancient Greek, Persian, and Indian medical traditions and the later works of medieval and Renaissance physicians in Europe. In addition to his importance in the field of medicine, Razi's fame also stems from his work as an alchemist and free-thinking philosopher.

Razi was born in the Persian city of al-Rayy (modern Shahr-e-Rey), near present-day Tehran, Iran. As a young man he cultivated talents in music, philosophy, and alchemy; however, as he grew older, he turned his attention to the study of medicine. During his distinguished career as a physician, he directed hospitals in both Rayy and Baghdad. He

also enjoyed royal patronage, traveling extensively in the service of the Samanid courts throughout Khorasan and Transoxiana (a Persian-Islamic dynasty in Central Asia, vassal of the Abbasids, from around 819 to 1005). Yet, far from leading the life of an idle courtier, Razi was praised as a tireless and compassionate clinician and teacher as well as a prolific writer.

Razi's most famous medical works are the *Kitab al-Hawi* (*Liber Continens*; The Comprehensive Book of Medicine) and the *Kitab al-Mansuri* (*Liber Almansoris*; The Book of Medicine for Mansur). The *Kitab al-Hawi*, a twenty-three-volume encyclopedia posthumously prepared by Razi's pupils, contains extracts from Greek, Indian, and Arabic sources on pathology, therapy, and pharmacology as well as records from his own clinical experience. The *Kitab al-Hawi* was translated into Latin in 1279 by Faraj ibn Salim, a Sicilian-Jewish physician employed by Charles I of Anjou. Thereafter, it became widely used throughout Europe as an encyclopedia and teaching manual. Similarly, the *Kitab al-Mansuri* became highly prized in Europe after its translation into Latin as the *Almansoris* by Gerard of Cremona (d. 1187). During the Renaissance, its ninth chapter, *Liber Nonus*, was often circulated by itself or with commentaries by leading physicians such as Vesalius. Another of Razi's most influential treatises, the *Kitab fi al-Jadari wa al-Hasbah* (Treatise on Smallpox and Measles), was the first to distinguish smallpox from measles. He also wrote treatises on kidney and bladder stones, diabetes, childhood diseases, allergies, psychosomatic medicine, and medical ethics.

Razi's works are characteristic of medieval Islamic medicine in that they are based primarily upon the

Greek scholarship of Hippocrates and especially that of Galen. However, despite his immense respect for the Galenic tradition, Razi claimed that his own clinical experience exceeded Galen's. Razi noted that his clinical methodology of studying cases contradicted Galen's description of fevers, which Razi believed to have been inspired by philosophical dogma. He even called into question the Galenic system of balancing the body's "humors," or elements. Accordingly, Razi—and indeed other Islamic physicians of the period—should not be seen as mere preservers of Greek medical thought during Europe's so-called Dark Ages, but rather as innovators in their own right.

Just as Razi relied on his clinical experiences and logic in the field of medicine, his empirical thinking led him to deny occultist and symbolic significance in his study of alchemy. Because of this, he may be seen as having transformed the study of alchemy into an embryonic form of chemistry. Throughout his works there are descriptions and classifications of mineral substances, chemical processes, and explanations of experimentation that meet the standards of empirical investigation in modern chemistry. While Razi's famous *Sirr al-Asrar* (Secret of Secrets) has generally been classified as alchemy, such a classification fails to take into account Razi's philosophical preferences—evident in *Sirr al-Asrar*—for reason, science, and observable reality over prophecy, revelation, and spiritual symbolism.

Razi's philosophical positions regarding reason and revealed religion were among the most heretical in the medieval Islamic world. He believed that man's intellect or reason was a divine gift that made revelation and prophecy superfluous. Razi praised humanity's intellectual potential, but violently attacked revealed religion, detailing how revealed religions and prophecies contradicted one another, were hostile toward scientific and philosophical progress, and were ultimately sources of conflict. He showed an obvious preference for Greek philosophy over the wisdom offered by the Quran. Thus, unlike Islamic Aristotelians, Razi denied the possibility of reconciling philosophy and religion.

The colophon (in Arabic) of al-Razi's *Book of Medicine*. The work drew on the scholarship of Hippocrates and Galen but was innovative in its own right.

As a result of Razi's heretical views, his contributions to philosophy in the Islamic world have been marginalized. Moreover, because his ideas never gained a large audience in the Islamic world, their impact on his small audience of Christian readers was limited at best. Yet, from a world historical perspective, Razi's free-thinking is still relevant. It challenges scholars to alter the monolithic picture of Islamic civilization that is often presented in Western scholarship. Similarly, Razi's important role in the development of Western medical practice indicates the necessity of expanding the history of

science and medicine beyond the study of modern Europe to include more Islamic contributions, especially during the Middle Ages, an era in which Islamic rather than European scholarship reigned supreme.

Amazonia

The world's largest tropical rain forest, the Amazon, has often been referred to as a "false paradise" inhospitable to human societies. New research revealing evidence about landscape manipulation and soils, however, suggests that various ancient societies practiced relatively intensive forms of agriculture. Thus, historians can now study the variety and complexity of human adaptation to both the challenges and the potential of the Amazon basin proper and the surrounding regions.

As the largest tropical rain forest on the planet, Amazonia holds a unique place in world history. A vast region that extends through present-day Brazil and seven other South American nations (Colombia, Ecuador, French Guiana, Guyana, Peru, Surinam, and Venezuela) it symbolically stands for the dominance of nature over humans and as a source of still-unknown plants and animals. But in fact Amazonia has been an intensively managed, human-made environment for many hundreds of years.

Early Settlement

Human occupation of Amazonia is much more ancient and more extensive than had once been assumed. By about 9000 BCE two lithic (using stone tools) traditions had become widespread in Amazonia as evidenced by stone implements, including arrowheads and edged cutting tools for processing animal game and grindstones for preparing maize, found by archaeologists. By 5000 BCE two more practices had emerged. First, there is evidence that by 2000 BCE groups on the Atlantic coast were using domesticated

plants, with maize use emerging in the Minas Gerais region by about 1500 BCE. Second, current research indicates that occupation of the lower Amazon began around 10,000 BCE, and there has been a dramatic discovery of ceramics from around 6000 BCE in a site along the lower Amazon, making this the earliest example of pottery in the Americas.

Close examination of this early period in northeastern Amazonia, along the Guiana coastal region, illustrates the close relationship between agricultural adaptation to a complex environment and a resultant development of appropriate lithic technologies. Transitions from gathering to the horticulture of certain plants, particularly the *ite* palm (*Mauritia flexuosa*) and the *mora* tree (*Mora excelsa*), as well as other utilitarian species, are directly reflected in the development of the lithic repertoire. Although these subsistence techniques are theorized as being ancestral to the emergence of tropical forest horticulture in the region, the developmental analogies are probably stronger with the *sambaqui* (shell-mound) peoples of coastal Brazil than with the occupants of the tropical forests because their horticultural and foraging repertoires are quite distinct. This suggests that progressive adaptation to the complexities of the Amazonian environment was a process repeated across the whole region.

Various ancient societies also practiced relatively intensive forms of agriculture, evidenced by widespread landscape modification throughout Amazonia. In fact, it has been argued that the landscape of Amazonia, as it is seen today and as it has been for the last 350 years or so, is the historical product of a return to a semi-wilderness as a consequence of the colonial depopulation of the native inhabitants. Moreover, the current evidence for the existence of

“Submerged forest in the Amazon River.” From the 1875 edition of *The Amazon and Madeira Rivers: Sketches and Descriptions from the Note-book of an Explorer*, by Franz Keller.

prehistoric roads and causeways in both the llanos (prairies) of Bolivia, Colombia, and Venezuela and in the heart of Amazonia itself indicates that these landscape modifications were related to the presence of large and complex societies.

For example, recently investigated systems of extensive ridged fields and agricultural mounds along the Atlantic coast of the Guianas underline how limited knowledge of the “tropical forest” region really is. The presence of complex agricultural techniques to deal with the low-lying, swampy conditions in this region, as well as the use of intensive farming practices from at least 700 CE, shows how complex adaptations were made to the variety of Amazonian environments. Thus archaeological evidence also fits well with the historical sources that report both significant population and a complex agricultural repertoire among the indigenous groups.

Soil Holds Clues

Apart from this physical manipulation of the landscape, recent research on ancient Amazonia has focused on anthropic or anthropogenic soils (that is, soils whose formation is directly related to human activity) and trying to assess what kind of soils in Amazonia may have been generated through human activities, how widespread they actually are, and to what extent such soils were intentionally fomented. The banks of the main channel of the Amazon as well as of many of its tributaries are replete with black earth sites, illustrating both the continuity and antiquity of human presence. The use of such sites for agricultural purposes thus illustrates both sophisticated knowledge of soil properties and systems of agricultural management that were stable over many generations.

These kinds of soils, particularly *terra preta* (black earth), which is black anthropogenic soil with enhanced fertility due to high levels of soil organic matter and nutrients, are common throughout Amazonia. This agriculturally valuable soil was created either through direct agricultural fertilization or as a consequence of intense human settlement, when human waste materials enrich the soil with nitrogen. The historical evidence shows that there was no one-to-one relationship between the presence of agriculturally favorable soils and the past existence of complex polity or an extensive cultural repertoire, but the investigation of anthropogenic soils now provides clear evidence that human occupation was not simply dependent on supposedly conducive environmental conditions, but also could persist in regions where *terra preta* was formed, consciously or not. Recent investigation of the many well-documented *terra preta* deposits along the main Amazon channel, as well as along its tributaries, has thus produced important and convincing data on the agricultural dynamics of past human populations.

Agriculture and Diet

The addition of maize to modes of subsistence that previously centered on palms and manioc, as well

"Our first interview with Caripuna Indians—Madeira River." From the 1875 edition of *The Amazon and Madeira Rivers: Sketches and Descriptions from the Note-book of an Explorer*, by Franz Keller.

as the systematic exploitation of other food plants, has also been the subject of study. But interest in the advent of maize cultivation results from seeing maize use as a token of social and cultural complexity, given its easy storage and high nutritional value, and so evidence of its use in Amazonia, where the use of manioc varieties is predominant in the historic and ethnographic reports of aboriginal horticulture, is especially significant. But this apparent predominance of manioc agriculture in ethnographic and historical materials about Amazonia may result from the way in which manioc use increased over the last five hundred years as a result of indigenous access to steel tools via trade with the Europeans. The use of steel axes would have permitted much greater clearance of forest for the forest of manioc, a root that must be dug from the earth, than the use of stone axes would have. As a result, and also stimulated by European trading interest in manioc flour,

there were distinct advantages for domestic groups in opting out of the systems of intensive agricultural production that sustain large civilizations. Consequently the dietary use of manioc, as opposed to maize, may well have increased substantially during the historic period.

Basic Questions Remain

The nature of these transformations over the last five hundred years is critical to an understanding of ancient Amazonia, but the sheer size of the region and the lack of sociocultural continuity between past and present society and culture, as a result of colonial conquest and depopulation, make comprehensive study of the environmental history of the region especially challenging. Many of the basic questions of Amazonian prehistory remain to be addressed more completely, not least of which are

those of the scale and longevity of human occupation. It seems likely that ethnography and history, as much as archaeology, will continue to play a role in the discussion of human adaptations to the Amazonian environment. Work in progress that emphasizes ethno-archaeological techniques, systematic survey, and interpretation of historical records, as well as the deployment of new technical resources, such as geophysical survey, seems well positioned to do justice to the complexity of Amazonian antiquity.

As these techniques are deployed and the database grows, it already seems likely that issues of human environmental adaptation will be cast in a different framework to that which produced the idea of Amazonia as some kind of false paradise whose apparent botanical bounty belied the actual poverty of its soils for human usages. Already much of the work there tends to suggest that Amazonia is too complex an environment, and its human adaptations too various, to be adequately characterized as either utterly unfavorable or uniformly conducive to human settlement. The very uncertainties about the definition of an Amazonian region, discussed earlier, reflect the fact that the conceptualization of Amazonia as a homogeneous entity is in itself flawed. As debates about models of the Amazonian environment are being replaced with actual investigation of human adaptations through time, researchers are in a better position to appreciate the variety and complexity of human adaptation to both the challenges and the potential of the Amazon basin proper, as well as of the surrounding regions.

American Empire

The American Empire, or American imperialism more generally, is a disputed concept that refers to the political, economic, military, and cultural influence of the United States around the world. The idea of American imperialism gained in popularity when the United States took possession of Spanish colonies following the Spanish-American War of 1898. More recently the term is invoked to critique U.S. foreign policy.

The issue of imperialism in the United States of America—that it to say, the idea of an American Empire—is a keenly debated, hotly contested topic. Some say the United States is an empire, and that it’s a good thing. Some say the United States is an empire, and that it’s a bad thing. There are those who say it is not an empire, but it should be. Others say the United States is not an empire, and that’s the way it should be. These debates occur both within the United States and beyond its borders. One reason for the lack of consensus on the topic of American Empire is the contention that the United States’ global reach differs somewhat from that of traditional (especially European) empires. Americans in particular tend to believe that the United States has not been an imperial power.

The American Empire, however, is real, with historical roots in the founding of the republic during the eighteenth century, its evolution during the nineteenth century, and its maturation during the early twentieth century. By the latter years of the twentieth century, especially resulting from the impact of two world wars, the United States possessed more power and had more global political and economic interests than any empire in the modern era. And by early in

the twenty-first century, some argued that U.S. foreign policy was expansionist to the point of being imperialistic.

U.S. imperialism developed in a generally different way than that of traditional European empires. Rather than invade countries with large armies, send in agents of occupation, maintain political and economic control through institutions it created and staffed with officials from the mother country and local collaborative elites, and restrict colonial sovereignty, U.S. officials and businesspeople created an empire that was principally commercial, based on free trade and massive overseas investment. After that empire was established, the United States had overwhelming influence and wealth and was able to control affairs in associated countries with great efficiency for the most part. So, without the formal trappings—and much of the political baggage—of imperialism, the United States enjoyed the greatest benefits of empire—and with many of the same downsides for the exploited—throughout much of the twentieth century.

Blueprint for the Empire

One can observe the foundations of empire from the outset of the U.S. republic. When seeking autonomy from the British Empire during the late 1700s, U.S. leaders devised a program for global influence, with John Adams even writing a “model treaty” for prospective alliances with the established powers of Europe that would have given the new country equal commercial footing with them based on the concepts of free trade and “most favored nation” trading rights.

Historic Trinity Church on lower Broadway dwarfed by the World Trade Center, May 1973. Long before 9/11, the “Twin Towers” were symbolic of the United States’ economic power in a global market. National Archives.

After U.S. independence, U.S. leaders such as Alexander Hamilton recognized that economic power, especially via industrial development, could lead to world power. Consequently, during much of the nineteenth century, the U.S. government pursued a program of industrialization, with protective tariffs, government grants, tax incentives, and subsidies to promote industrial and international growth. Undeniably, the use of slave labor in certain industries, such as cotton and sugar, also advanced the cause of economic development and expansion.

The global interests of the United States at the time were still limited, subordinate to the need to

develop the economy at home. However, by midcentury one could see the United States stepping out into the world, taking land by force or purchase in Oregon, Texas, California, Alaska, and elsewhere and envisioning a Caribbean Empire in Cuba, Santo Domingo, Nicaragua, and other places; deploying gunships to Japan to demand open markets; creating bonds with British financiers to pay for the Civil War; and sending missionaries and businesspeople to foreign lands to expand U.S. interests all over the world. Clearly, the American Empire did share some affinities with the empires of old.

Stepping Out

By the late 1800s the United States was about to become an imperial power, through both design and necessity. U.S. theorists of empire, such as Alfred Thayer Mahan, Minister Josiah Strong, and Brooks Adams, cited the need to expand republican institutions and Christian doctrine, fulfill manifest destiny (a future event accepted as inevitable) and social Darwinism, and expand “civilization” to avoid decay. They pressed for an imperial agenda and reached responsive and influential targets such as presidents William McKinley, Theodore Roosevelt, William Howard Taft, and Woodrow Wilson, as well as most diplomatic officials, business leaders, and media representatives. The United States was embracing the ideology of imperialism and, during the 1890s, stepping out into the world aggressively with purpose and success. Secretary of State Richard Olney boasted, for instance, that “the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition.”

The principal factor in U.S. emergence as a global power, however, was the need for foreign commercial relationships to avert economic crises at home. During the latter part of the nineteenth century the United States was wracked with labor and agricultural unrest, currency controversies, and deflation and depression. As the U.S. oil magnate John D. Rockefeller explained: “dependent solely upon local business, we

should have failed years ago. We were forced to extend our markets and to seek for foreign trade.”

Accordingly, the United States, using the liberation of Cuba from Spanish rule as its pretext, went to war in 1898 and ultimately took control of not only Cuba, but also Puerto Rico, Guam, the Philippines, and Hawaii—the only places where the United States would establish the formal trappings of empire. Its global reach and imperial-like power, however, would only grow.

Buttressed initially by what President William Howard Taft called “dollar diplomacy,” and similar to other empires, the United States would soon rely on military might. The United States embarked on a path that would create one of the greatest empires in modern times, one based on finance capital, private markets, the exploitation of raw materials elsewhere, the search for cheap labor, and global consumption. In the process, U.S. officials extended national power into all areas, using force when necessary to create commercial opportunities. As the soon-to-be president Woodrow Wilson observed in 1907, “since . . . the manufacturer insists on having the world as a market, the flag of his nation must follow him, and the doors of nations which are closed against him must be battered down. Concessions obtained by financiers must be safeguarded by ministers of state even if the sovereignty of unwilling nations be outraged in the process” (Parenti 1995, 40).

By 1914, the eve of World War I, the United States was extensively involved in the economic and political lives of societies on virtually every continent, with growing interests in China, Mexico, and the Caribbean. The United States began to extend its power more aggressively, intervening in the Boxer Rebellion in China, the Russian Civil War, the Mexican Revolution, and the affairs of a host of Latin American countries per the “Roosevelt Corollary” to the Monroe Doctrine, which asserted the right of the United States to act as a global policeman in the hemisphere. With the outbreak of war in Europe, President Woodrow Wilson’s “liberal capitalist internationalism” led the United States into the first rank of world powers.

World Wars and World Power

Woodrow Wilson, like Roosevelt and Taft before him, believed that capitalism, not traditional imperialism, leads to the greatest wealth and power and would promote peaceful relations between nations. Countries that traded, these presidents reasoned, would be less likely to fight. In 1914, as the European powers went to war, the United States was the greatest industrial power in the world but had limited military capabilities. Wilson would thus use the power of capital to extend U.S. influence, conducting vitally needed trade with Britain and France, brokering loans to the allies to keep them afloat and fighting, and finally intervening in 1917 to preserve the British gold standard. Wilson’s involvement paid off. By 1919 the United States, which had entered the war as a debtor nation, had \$11.7 billion in credits, and the seat of global economic power had moved from London to Wall Street.

During the ensuing decades, even with the vagaries of the Great Depression and so-called isolationism, the American Empire proceeded apace. Viewing the maintenance of the Open Door (a policy giving opportunity for commercial relations with a country to all nations on equal terms) as “the road away from Revolution,” President Herbert Hoover during the 1920s and 1930s continued the aggressive search for markets, with U.S. military intervention and repressive client states backing up that approach, particularly in Latin America. Even with the advent of the “Good Neighbor Policy” of President Franklin D. Roosevelt, the U.S. economic stake and political influence in Latin America grew, setting the stage for future anti-American movements in Latin America.

By the 1940s, the United States had maintained as much politico-economic power as possible given the global crises of depression and militarism in Europe and Asia and was about to emerge as the dominant global power with the coming of World War II. Germany and Japan posed threats to the global community not just because they invaded sovereign lands, but also because their versions of economic nationalism, or autarky, threatened to close off large

and economically crucial regions to open commerce. Hence, the United States had to take action against such aggression, and, after Germany's aggression in France, Britain, and the Soviet Union and the Japanese attack at Pearl Harbor, Roosevelt mobilized the economy for war, sending huge amounts of military materiel to the anti-Axis nations, ultimately committing U.S. troops to Europe and the Pacific. The Axis powers were Germany, Italy, and Japan. At war's end in 1945 most of Europe and Asia was devastated, with massive reconstruction needs looming. But the United States came out of the war stronger than ever, with the new Bretton Woods system—the International Monetary Fund (IMF) and World Bank along with the dollar set as the world's currency, fully convertible to gold—in place as a means of economic influence.

Positions of Disparity

Using the IMF, World Bank, reconstruction loans, and the Marshall Plan (a plan for economic recovery in European countries after World War II), as well as wielding preponderant military power and holding nuclear weapons, Washington was able to exercise vast economic, and hence political, influence during the Cold War. Indeed, after World War II the United States exercised arguably the greatest power in the modern era. Writing in 1948, the U.S. diplomat George Frost Kennan candidly observed that “we have 50 percent of the world's wealth, but only 6.3 percent of its population. Our real task in the coming period is to devise a pattern of relationships that will allow us to maintain this position of disparity.” In subsequent decades the American Empire continued to expand, by both commercial and military means.

In 1950 the U.S. National Security Council produced *NSC-68*, perhaps the most important postwar document concerning the growth of U.S. power. In it the NSC urged vast increases in military spending to contain not only the Soviet Union but also any country that threatened U.S. interests. This gave great impetus to the so-called military-industrial complex. Defense spending and the arms race soared as the

United States became involved in commercial and political affairs seemingly everywhere. Not only did Washington promote free trade and investment abroad, but also it intervened militarily in disparate places such as Korea, Iran, Guatemala, Indonesia, and Lebanon when it perceived that its interests were at risk. At the same time, taking advantage of the power of the dollar and the Bretton Woods institutions, the United States forced former empires to open their markets to U.S. traders and investors, thereby giving U.S. businesses global access. At home, this period of economic expansion created prosperity for working people, while the political force of McCarthyism and the Red Scare kept critics of the empire silent or ineffective. McCarthyism, named after Senator Joseph McCarthy, was a mechanism by which the establishment targeted and attacked any sector of society or individual deemed subversive.

By the mid-1960s the United States could wield the power of the dollar and the armed forces to promote its interests virtually everywhere. However, limits to U.S. power began to appear; despite attempts by a series of administrations, the Communist government of Fidel Castro in Cuba could not be ousted. Moreover, the U.S. became increasingly bogged down in a growing war in Vietnam, which would ultimately expose the shortcomings of U.S. power both militarily and economically. Despite staggering amounts of firepower, the United States could not subdue the Vietnamese Communist/nationalist liberation movement. Meanwhile, the soaring costs of the war caused massive deficits in the U.S. balance-of-payments ledger and a run on gold, per the Bretton Woods system. By 1971 President Richard Nixon had to concede the limits of empire by abandoning the Bretton Woods system and taking the country off the gold standard. Politically, challenges to U.S. interests emerged globally. By the late 1970s such developments, worsened by “oil shocks” in 1973 and 1979 and the emergence of Japan and the Federal Republic of Germany as economic competitors, made the American Empire appear to be on the wane.

Barely a decade later, however, the empire struck back. Massive military spending during the

administration of President Ronald Reagan and the collapse of the Communist system in Eastern Europe left the United States without a serious global rival for power. Thus, despite massive deficits at home, the United States stood alone as a global hegemon. Supranational economic arrangements such as the World Trade Organization (WTO) and the North American Free Trade Agreement (NAFTA) and wars against national liberation movements in Central America signaled to the world that Washington would not yield its power quietly, that it would, in fact, continue to craft the trading empire that it had begun a century earlier.

By the mid-1990s, with a convincing show of military power in the Middle East and a commitment to globalization in effect, the United States seemed to have the unlimited ability to wage war and gain access to markets. However, this newly expanded hegemony brought a new level of criticism with it. Not only human rights groups and activists, but also less developed countries, some key allies, and even sectors of the ruling class began to question the power of transnational corporations and supranational institutions. The terrorist attacks in the United States on September 11, 2001 and the response it generated in some parts of the world were another signal that U.S. power had its limits and that the U.S. imperial mission had its enemies.

More telling, the U.S. response to those attacks, especially its invasion of Iraq, led to the most serious attack on the imperial position of the United States in a half-century. The George W. Bush administration's war against Iraq, conducted largely unilaterally, undermined U.S. prestige, worsened strains in the U.S. relationship with critical European allies, fueled anti-Americanism abroad to new heights, and led to a bloody occupation in Iraq. Despite some early successes, the deteriorating state of the war in Afghanistan has further strained relations with allies and enemies alike. The Bush administration seemed to be resorting to older forms of unilateral *imperium* (supreme power), not dissimilar to the nineteenth-century European way. Coupled with the backlash against globalization, the inability to broker peace

in the Middle East, and the global economic and financial crises of 2007–2009, the U.S. position in the world could potentially recede to position not seen since the earlier stages of the twentieth century. The response of the administration of President Barack Obama to these testing matters could well prove decisive.

In just a little more than a century the United States emerged as a global power, reached commanding heights of power and wealth, achieved an unmatched capacity to influence the world, and has seen its positions criticized and attacked—which is the lot of empires. In the twenty-first century new challenges, such as the rise of China and India, along with a resurgent Russia—and new limits—face the American empire. As for all empires and self-appointed “global police,” new strategies will be required to deal with these emerging challenges confronting the world.

Americas, The

Diverse and isolated cultures developed during the 13,500 years of human habitation of the Americas before the European arrival in 1492. That encounter produced some tragic consequences but also integrated the Americas amongst themselves and with the rest of the world. Eventually, the resulting exchanges between Old World and New created opportunities for both, while the shock of the encounter initiated enduring reflections about human rights, liberty, and political legitimacy.

Before Europeans created the notion of “America” as a synonym for their concept of the New World they “discovered,” the Western Hemisphere was not a single and self-conscious world: it contained many worlds, each self-contained and unaware of the others. The story, then, of the Americas must follow the paths of their integration as well as their impact on an outside world that considered “America” a singular addition to the sorority of continents.

Origins and Isolation

The first human groups arrived in the Americas at some point as early as 15,000 years ago—at least in part—by following migrating herds on open tundra and crossing the land bridge that had formed, due to a drop in sea level, between what is now the Bering Strait and Alaska. They probably kept crossing in different waves throughout the Ice Age along alternative routes when the passage submerged again—glacier-hopping across the 80 kilometers (50 miles) separating Siberia from America on small craft and negotiating the narrow coastal paths left by ice-sheets. The culture

that succeeded these early peoples, the Clovis hunter-gatherers, so-named for the town in New Mexico near the archaeological site where they were discovered, date to about 12,500 years ago. They multiplied and spread across America in perhaps as little as a thousand years at a pace that conforms to that of other hunter-gatherer groups.

Humans had an important impact on the biota of the Americas. Their proficiency at hunting contributed, along with the changeable climactic conditions, to the extinction of about thirty unique large mammal species that had evolved during the Pleistocene era since America’s separation from Pangaea. Similar extinctions had occurred in the isolated continents of Australia and New Zealand when humans first colonized them about 15,000 years earlier. After the end of the Ice Age America remained largely cut off from the rest of the world. The few exceptions included further migrations by sea from northeast Asia, the assumed Pacific voyage that took the sweet potato to Polynesia, or the fleeting Viking settlements in Newfoundland.

A profound consequence of the end of America’s isolation in 1492 CE was the spread of contagious diseases to which indigenous American populations had no immunity. Some Caribbean islands lost their entire native population to disease and exploitation, while the population density along the Amazon River basin has never recovered from Francisco de Orellana’s navigation of the river from Peru to the Atlantic in 1542 CE. Estimates agree that the population of the Americas collapsed by about 90 percent over the 150 years that followed the European arrival.

American populations before 1492, for all their divergences, shared with each other and with other

Martin Waldseemüller drew this 1507 map of the world in the tradition of the Ptolemy map. It is the first known document to label the landmass "America," after Amerigo Vespucci (1454–1512).

populations that had not been in contact with Afro-Eurasians, a common immunological disadvantage. They suffered similar fates. On the other hand there was not a single contagious disease to which they alone had immunity but the Eurasians did not. The imbalance can be explained by the axes along which the landmasses of America and Eurasia extend and by the effects on the development of agriculture.

Agriculture and the Columbian Exchange

Agriculture may have arisen independently in many places. In the Americas, however, three or four nuclei had conspicuous roles in spreading techniques of domestication of plants and animals. Mesoamerica developed edible maize varieties by 5000 BCE and supplemented them with squash (8000–6000 BCE), beans (c. 4000 BCE), and turkeys (by c. 3500 BCE); independently, hundreds of different species of potatoes, were being farmed in the Andes by 5000 BCE, together with manioc, llamas, and guinea pigs. In the Amazon Basin, trees were cleared for the planting of squashes and tubers around 7000 to 6000 BCE, and some populations of the eastern United States were cultivating sunflower and goosefoot by about 2500 BCE. Areas where populations concentrated or microclimates created ecological diversity were propitious

for the rise of agriculture. The fertile upland valleys to the rainforests of Mesoamerica, and the Andean high plateau and river valleys that slope down to the sea offered such conditions better than anywhere else in the continent.

Cultivation and domestication spread along the longitudes of America more slowly than they did along the more environmentally uniform horizontal axis of Eurasia. Even maize, the most adaptable and successful American crop, which penetrated north to the modern United States and south to Peru, as well as across the sea to the Caribbean islands (where the name *maize* comes from) before Columbus arrived, traveled and adapted at a slow pace compared to the exchanges taking place in Eurasia. The problems of transmission across climatic zones inhibited the transfer of crops and other biota from one region to the next: potatoes and llamas never reached the dense population centers of Mesoamerica from Peru, while Mexican turkeys never reached the United States or Peru until Europeans took them there. On the other hand, in Eurasia, humans from Portugal to China knew the whole gamut of crops and domesticated animals by 1492. Agriculture was more widespread and the human population was much greater as a result.

The so-called Columbian exchange that followed the European colonization of the Americas began

to integrate the biota of the Americas with those of the rest of the world, reversing the trend that had occurred since the separation of Pangaea. While new ingredients, such as chocolate and tomatoes from Mesoamerica, enriched Old World cuisines, and tobacco fumes enveloped the globe, ecological exchange opened new areas to sustainable and increased human habitation. North European dependence on the nutritious potato is well known. American products soon reached as far as China, where maize and sweet potatoes supplemented the traditional diet and allowed the cultivation of the previously uninhabited forested uplands of the Yangzi Basin in the eighteenth century. China is now the world's largest producer of potatoes and the second largest producer of maize. In the same vein, Eurasian sugar became a profitable cash crop that facilitated the commercial viability of colonizing Brazil and much of the Caribbean with the labor of African slaves. The vast and unvarying expanses of the North American plains or Argentine Pampa became viable for agricultural exploitation when nineteenth-century technological innovations combined with the introduction of Afro-Eurasian manpower, crops, and cattle to unlock their potential, turning them into the granaries of the world.

Empires, Imperialism, and Colonization

Pre-Columbian agriculture turned the areas of greatest biodiversity, where it flourished most easily, into the richest, most densely populated and influential regions of the hemisphere, a balance that favored the Andes and Mesoamerica until the early nineteenth century. The Andes saw the first experiments in large human settlements. In central Peru, from late in the second millennium BCE, under the cultural influence of cities like Chavín de Huántar, a continuous tradition of large cities and powerful states emerged. The seminal civilization of Mesoamerica was the Olmec, (1200 BCE declining and eventually disappearing after 400 BCE) whose influence fanned out from southeastern Mexico to all of Mesoamerica, and indirectly to the north beyond. The great urban center of Cahokia on the Mississippi (at its height in the early thirteenth century CE), depended on outlying communities that engaged in intensive agriculture to support the population of city dwellers, including religious leaders and government officials, trade workers, astronomers, and artisans. But it never attained the density of population or the longevity and influence of cultural traditions that the Andeans and Mesoamericans achieved.

Andean culture flourished along a corridor of fertile mountain valleys, highland plains, and irrigable deserts, flanked by the Amazonian lowlands and the Pacific Ocean, with an intractable desert to the south and untamed tropical rainforests to the north—limits still recalled after the conquest in the map drawn by the Quechua Indian Felipe Guaman Poma de Ayala (1535(?)–c. 1620)—*Mapa Mundi del reino de las Indias* (within his *Nueva Cronica y Buen Gobierno* c. 1615). Mesoamerican civilization spanned the diverse ecosystems ranging from the rainforests of Guatemala that were colonized by the Maya to the intractable frontier of seminomadic populations living in arid northern Mexico, whom the settled populations regarded as barbarians, much as the Chinese saw the Mongols or the ancient Romans deemed the Germans. Within both culture regions there developed very

diverse ethnocultural and linguistic communities of small polities akin to city-states supported and often defined by the ecological context of their hinterland. Despite their interactions and similar sociopolitical organizations (like princely government and stratified societies), religious rites (like various degrees of human sacrifice) and mythologies (interchangeable deities), there was still such diversity that even seemingly important cultural traits like the expressive classical Mayan (c. 200–900 CE) writing system failed to be adopted elsewhere in the Mesoamerican culture zone. Even the unifying embrace of empires implied little more than a tributary relationship, without the formal imposition of any cultural uniformity.

The Aztec (c. 1427–1521) and Inca (c. 1400–1532) empires were the latest manifestation of long imperial traditions in both Mesoamerica and the Andean cultural regions. Like the concept of a unified China, the American imperial traditions were resilient and survived the overthrow of past empires. Also like China they tended toward encompassing the majority of their acknowledged world: for the few weeks after defeating his brother in a civil war to unify their father's empire, Atahualpa Yupanqui, the last Inca emperor (1525–1532), had a much greater subjective claim to have pacified and united his world than Alexander the Great or Chinggis (Genghis) Khan. The Amerindian empires were unusual in world history for controlling enormously diverse ecological zones in their search for ever more varied products to consume. In pre-industrial times populations grew slowly, wealth and resources hardly increased, a zero-sum game assumption of the world predominated: predatory imperial capitals like Teotihuacán (first century BCE to eighth CE) or Mexico-Tenochtitlán (mid-fourteenth century CE–present) grew to be the largest cities in the hemisphere and amongst the most populous on a global scale from the tribute of their far-flung dependencies. They were tolerated because tribute bought the empire's peace, protection, a degree of autonomy, internal mediation of disputes, and new commercial opportunities for subject polities.

The endurance of these imperial traditions helps to explain why so few Spaniards were able to dominate

the two richest culture zones of the Americas so quickly (the Aztec Empire 1519–1521 and the Inca heartlands 1532–1533) after replacing their respective imperial elites, while the more fractured and less densely populated zones in the Araucania of Chile or the seminomadic peoples of North America proved so intractable. Mexico City's imperial role to some extent survived the Spanish conquest. Spanish viceroys, often still referred to as *tlatoani* by native speakers in sixteenth-century texts, were able to muster repeatedly the considerable manpower of Mesoamerica and direct it toward the extension of what can be seen as the city's sub-empire. New Spain upheld pre-conquest commercial and strategic interests as well as initiating specifically European quests for silver, European crops and animals, and access to Atlantic and Pacific trade. New Mexico, Honduras, Florida and the Philippines were conquered for the Spanish kings with Mesoamerican manpower directed from Mexico City and then governed, in the first instance, by viceroys.

Spanish dominion over the richest portions of the Americas was an unlikely feat with a profound impact on world history. The Spanish Empire pioneered the cultural and commercial integration of the Americas as well as its commerce with the rest of the world. Spain's creation of a territorial, rather than a merely commercial, empire like the Portuguese or Dutch—in a populous continent rich in silver, gold and other valuable resources—began to equalize and then reverse the world's economic balance in favor of Europe, until then a “poor promontory of Eurasia,” and away from Asia. The process culminated with the rise of the contemporary world's only superpower, the United States, in the traditional northern backwaters of the Americas, populated primarily by Eurasians and Africans.

In the long run the integration of the Americas with the rest of the world reversed the historically predominant balance of wealth, power, and cultural influence from the center-south of the hemisphere to the north. Like other traditionally potent pre-industrial centres like China or India, Mesoamerica and the Andean region fell behind during the century that elevated

Quechua-Indian Felipe Guaman Poma de Ayala's "Mapa Mundi del reino de las Indias" (within his *Nueva Cronica y Buen Gobierno*, c. 1615).

most of Europe and the United States to global economic hegemony through industrialization. Debt and militarization were the legacy of Iberian-America's wars of independence (1810–1821 CE). As in Spain and Portugal, Latin America's inability to achieve satisfactory political stability for most of the nineteenth century and into the twentieth century slowed their investment in industrial and technological advances, despite their plentiful natural resources. After independence Mexico was unable to exploit or control 2 million square kilometers of its northern frontier that were absorbed by the industrialised north in 1848 CE. Despite impressive economic strides and political stability through most of the twentieth century, Mexico has failed to meet its potential. The southern territorial giants, Brazil and Argentina, whose potential has at times in their history attracted comparisons to the United States, have so far failed to exploit their hinterland or their natural bounties as effectively as the United States, while resource-rich countries like Venezuela have not capitalized their assets to create sustainable alternative sources of economic growth. Internal divisions of race in a context of nationalist rather than multiethnic imperial organizations, along

with extreme economic inequality and until recently social instability have continued to plague the less successful center and south of the hemisphere, which some see as the "backyard" of the richer more influential United States.

Reflections, Myths, and Notions of Liberty

The European encounter with the Americas brought about the integration of the hemisphere and a greater cultural homogenisation than at any point before. With few exceptions, the vast majority of the continent's physiologically diverse population communicates in European languages and practices varieties of Christianity which Europeans introduced and natives and Africans modified, along with other cultural manifestations first associated with Europe. The Americas are not merely an extension of Europe, however, though both might be classified as forming part of "the West." Rather, the Americas reflected back Europe's transforming gaze.

The myths that surrounded the achievements of European adventurers over populous and exotic empires

bolstered Europeans' confidence in their imperial rights and supposed abilities, dormant or frustrated since the classical age and now revived and surpassed. In Spain's American possessions, European political theories of modern statute-based bureaucratic government were first attempted from the sixteenth century, before they were tried in tradition-bound Europe. Slavery also enjoyed a renaissance and was practiced in various degrees over much of the hemisphere at a time when it was disappearing in Europe, creating a profound effect on the development of American societies and perhaps an even more pernicious one on the African peoples that supplied the slaves. The tragedies of conquest and epidemics initiated pained and enduring humanitarian reflections: Bartolomé de las Casas (1484–1566) proclaimed the then-revolutionary doctrine that “all the peoples of mankind are human,” a view endorsed by Pope Paul III's papal bull of 1533 embracing the humanity of Amerindians. The Spanish crown responded, and motivated by conscience and an interest in maintaining their labor-force, proclaimed legislation like the “New Laws” (1542) that sought to protect Amerindian subjects. Both the Hispanic notions of *mestizaje* (cultural and racial mixing) and the U.S. or Brazilian self-conceptions as melting-pots or plural societies were born of the more positive traditions of American and European interaction. There is a clear continuity between these ideas, and our contemporary acceptance of universal human rights, which in turn enjoys global influence because of “the West's” power.

The Americas became linked with the liberating feeling of newness. Utopians like Vasco de Quiroga experimented with “ideal” communities in sixteenth-century Mexico, and Puritan “cities on a hill” were founded in New England. The inherent goodness of man was identified in the “noble savages” of uncivilized corners of the continent, while Romantics learned their rapturous awe of nature in the spectacular untamed landscapes of North America. An impoverished sixteenth-century Spanish adventurer

could hope to improve himself by being recognized as a nobleman for his achievements in the Americas and enjoy his notion of liberty to participate within his empire's “political nation,” while an eighteenth-century Virginian landlord could see himself as a new Roman republican hero, complete with slaves, and create a constitution fit for an “empire of liberty” that with some modifications has defined the modern world's ideals of political legitimacy.

Andean States

The early civilizations of the Andes were shaped by the geography of the region—rugged mountains, desert coastal plains, and narrow river valleys—into independent, self-sufficient communities. Gathering these villages under state rule required coercion and the redistribution of goods. Because no written records exist, the history of the pre-Incan Andes has been interpreted entirely from the archeological record.

A state can be defined as a regionally organized polity that contains a hierarchical and centralized political structure that maintains social stratification and coordinates human efforts. Unlike civilizations in many other regions of the world, the civilization in the Andes had no system of writing prior to the Spanish conquest in the 1530s. Therefore, there are only eyewitness accounts of the last Andean state, the Inca Empire. The Incas, however, were the culmination of a process of state development that began more than 4,000 years earlier. Our understanding of earlier states of the Andes must be gleaned almost exclusively from the archaeological record. This reliance on the artifacts and sites left behind unfortunately creates interpretation problems for scholars. The “footprint” of a state can look very similar to the “footprint” of a chiefdom; the nuances of a state’s ideology and economic system can be difficult to understand from collections of pots and rocks. Nonetheless, a tentative picture of the evolution of Andean states can be drawn based on decades of meticulous archaeological work.

State Foundations

By about 6000 BCE, hunting and gathering groups both in the high Andes and along the Pacific coast

of South America transitioned slowly into a mixed subsistence strategy of gathering, fishing, and farming. This transition led to the establishment of small, semipermanent villages that dotted the seaboard by 3000 BCE and to the development of more politically complex societies on the coasts of present-day Ecuador and central Peru. In Ecuador, the Valdivia culture (3500–1500 BCE) shifted slowly toward more intensive fishing and agricultural practices, and some status inequalities may have emerged. The largest Valdivia sites, such as Real Alto, grew to more than 30 hectares, and at their height they boasted a ring of houses surrounding a plaza and two small mounds. Valdivia’s monumental architecture, however, pales in comparison to that of the Supe valley of central Peru. In the middle of the third millennium BCE, as many as eighteen cities grew in the valley on the strength of an economy based on cotton cultivation and inter-regional trade. The best documented of these sites, Caral, is a 68-hectare complex containing six stepped pyramids, the largest of which is 19.5 meters tall and 135–150 meters at its base. The site, radiocarbon dated to 2627–1977 BCE, boasted elite residences, workshops, and commoner dwellings.

While the Valdivia culture declined in the second millennium BCE, the monumental architecture tradition continued on the northern and central coast of Peru. From 1800 BCE to 800 BCE, villagers built scores of sunken courts, platform mounds, and temples. These sites were suddenly abandoned around 800 BCE, perhaps due to catastrophic flooding from an El Niño weather phenomenon. The highland site of Chavín de Huántar, located in the northern highlands of Peru, rose in importance after this event. At the peak of its power from 400 BCE to 200 BCE, the site was an

important pilgrimage center—as evidenced by artifacts found there from a wide region, along with ritual objects and shamanic iconography—whose influence could be seen on artistic styles throughout much of Peru. At this time, the site covered almost 30 hectares and was dominated by a 2.25-hectare monumental stone temple riddled with galleries, airshafts, and water channels. The sites from these periods were often massive, but were likely not the products of a state-level civilization. At this time, the degree of status differences and labor specialization appear insufficient for a state. Nonetheless, the harbingers of the state can be seen in the ability of these polities to organize large amounts of labor for construction projects, the separation of people into different status groups, and an increasing tendency toward labor specialization. The trends toward statehood culminated in the development of the Moche culture on Peru's north coast.

Moche

By the end of the first century CE, the site of Cerro Blanco gained control over the other cities along the Moche and Chicama rivers. By about 400 CE, Moche-style ceramics and architecture could be found from the Lambayeque valley in northern coastal Peru to the Nepena valley, some 250 kilometers south. Known for its public architecture and high degree of craft specialization, Cerro Blanco, a large site in the center of the state, became the capital of the Moche state. The site covered over 1 square kilometer and was dominated by the Huaca del Sol and the Huaca de la Luna (the Temple of the Sun and the Temple of the Moon), two massive platform mounds constructed out of mud bricks. The Huaca del Sol was one of the largest mounds ever built in the Americas, and recent excavations at the Huaca de la Luna have revealed beautiful polychrome murals and human sacrificial victims. Elite complexes of grand courts, low platforms, workshops, and living residences clustered around the two *huacas*.

The opulence and pageantry of elite life is also reflected in depictions on pottery and in the wealth of clothing, jewelry, and other items found in the burials

of three priests at the Moche provincial site of Sipán in the Lambayeque valley. Lambayeque and the other valleys outside of the Moche-Chicama heartland were likely integrated into the state in different ways. Some groups were conquered and directly administered by centers that likely housed Moche officials, while other groups were nominally independent from the state but closely aligned with it through economic and political ties.

The Moche was not the only culture that flourished during this period. The Lima, Nazca, and Pukara cultures were important regional powers elsewhere in the Andes. However, none of these groups rivaled Moche in size or degree of political centralization. Beginning around 600, Moche unity unraveled. Cerro Blanco was abandoned, and massive constructions at two cities, Pampa Grande in Lambayeque and Galindo in the Moche valley, suggests that the state broke up into at least two parts. While the reasons for Moche's decline remain unclear, shifts in the El Niño current at this time caused successive waves of long droughts and torrential rains. These environmental pressures, coupled perhaps with internal strife and conflict with the expanding Wari state, likely led to the breakup of the last remnants of the Moche state around 800.

Tiwanaku and Wari

Near the southern shore of Lake Titicaca (on the border of present-day Peru and Bolivia), the site of Tiwanaku became an important regional center by 350 CE. The city, oriented around a complex of mounds, sunken courtyards, megalithic stonework, and statues, appears to have been an important pilgrimage center. By about 550, Tiwanaku became the capital of a state that controlled much of the area around the Titicaca basin. Tiwanaku architecture and artifacts are found throughout the region, and there is some evidence that the state increased agricultural yields by resettling farmers and streamlining the network of irrigation canals and raised fields that were situated around the lake. Tiwanaku had a significant impact on the iconography of ceramics and textiles throughout northern Chile, northwestern Argentina, Bolivia,

and Peru. This influence likely reflects the persuasiveness of their religion and the length of their trade networks rather than the incorporation of this area into a far-flung empire. Nonetheless, there are a few sites in the Moquegua (Peru) and, perhaps, Cochabamba (Bolivia) valleys that were established by Tiwanaku settlers in order to exploit lands at lower elevations.

By about 500, the site of Wari became the capital city of a state that we know by that name in the Ayacucho region of central Peru. While much of Wari's iconography was derived from Tiwanaku examples, the rise of the state appears to have been the culmination of local developments. Between 700 and 1000, the spread of Wari artifacts and architecture throughout Peru points to the increasing power of the polity. Wari appears to have taken control over some areas by creating regional administrative centers and shuffling political hierarchies, site locations, and economic systems to fit their needs. At least twenty administrative centers, the largest of which, Pikillacta, measured 800 meters on a side, may have been connected to the capital through a network of roads. Other areas of Peru, however, bear few or no traces of Wari domination, and it is likely that these areas enjoyed more independence from the state. The Wari state ended around 1000, and Tiwanaku followed soon after. Some scholars suggest that their demise can be linked to a multiple-year drought, though no definitive reasons for the states' collapse have been agreed upon.

The Chimu State and the Kingdoms of Peru

In the wake of the Tiwanaku and Wari collapse, regional polities filled the power vacuum left in the central Andes. The most complex of these societies was the Chimu state on Peru's north coast. By about 900, the state controlled about 1000 kilometers of coast from the city of Tumbes in the north to the Chillón valley in the south. The capital, Chan Chan, was a sprawling metropolis of more than 6 square kilometers. Ten palaces, each built by a successive Chimu king, dominated the heart of the city. A palace

would serve as the administrative hub of the state during the ruler's lifetime, and then turn into a mausoleum to the ruler after his death. The Chimu also erected several regional centers in other areas, but their most impressive achievement may have been the construction of an intervalley irrigation system of massive earthen canals that brought water to fields from as far as 70 kilometers away.

Although other polities during this period are often called kingdoms, they do not appear to have achieved sufficient size and complexity to be classified as states by most archaeologists. The Chincha culture of southern Peru, for example, was the preeminent trader along the Pacific coast, but the Chincha chose to control the sea instead of controlling the lands around them. The Aymara kingdoms of Lake Titicaca were perhaps the most populous and powerful in the Andes, yet remained politically fragmented. Other cultures, such as the Ica, Wanka, Chiribaya, Inca, and Chanka, were important regional powers that also failed to develop into states. By at least the beginning of the fifteenth century, however, one of these groups, the Inca, consolidated the area around Cuzco into a state that eventually dominated Chimu and the kingdoms of Peru.

The Inca

The Inca Empire, the largest pre-Hispanic state ever known in the Americas, stretched from the northern border of Ecuador to the present-day Chilean capital of Santiago. According to native accounts and archaeological evidence, the Inca expansion began in the first half of the fifteenth century. Using a mixture of diplomacy and force, the Inca managed to conquer much of the Andean cordillera in less than one hundred years. Cuzco, the capital, contained an assortment of palaces, temples, and residences arranged around two plazas in the city's center. Royal estates, like the site of Machu Picchu, dotted the landscape around the capital.

The Inca Empire arranged conquered populations into four administrative quarters called Collasuyo, Antisuyo, Cuntisuyu, and Chinchasuyu. Although

many local practices were often allowed to continue in conquered regions, the empire frequently made significant changes to a group's political organization, settlement locations, and economic specializations. The heart of imperial administration was a system of regional centers that were interconnected by a road system. Among the many purposes served by these facilities, the most important was the collection and redistribution of goods obtained by the state through the labor tax levied upon its subjects. The Inca labor tax was couched within an idiom of reciprocity by which the Incas would return services rendered to the state by hosting workers at feasts where prodigious amounts of food and corn beer were consumed.

By the beginning of the sixteenth century, Inca rulers strained to keep down rebellions throughout the overextended empire. Wave of epidemics and a war of succession further weakened the Inca state in the 1520s. Francisco Pizarro (1475–1541) and a small band of Spanish adventurers delivered the deathblow to the empire by capturing Cuzco in 1533.

The Evolution of the Andean State

Along with Mesopotamia, China, Egypt, India, and Mesoamerica, the Andes is one of the locations to witness the emergence of the first states. While Andean examples share certain similarities with these other early states, we cannot understand the evolution of Andean social complexity without an appreciation for the region's landscapes and cultures. The Inca Empire, for example, was adapted to the rugged mountains, desert coastal plain, and narrow river valleys of the Andes. The people of the Andes adapted to this environment by creating kin-based communities that united agricultural and herding settlements draped across highly compacted environmental zones. With their few outside needs provided by llama caravans that carried products from place to place, the challenge faced by Andean states was to find a means by which to coax these independent, self-sufficient groups to come under their control. The earliest societies in the

Andes failed in their attempts to build states through the manipulation of religious ideologies alone. Successful states in the Andes, including the Inca, also had to rely on coercion and, more importantly, the redistribution of food, drink, and prestige objects. Clearly, to understand the evolution of the Andean state, one needs to understand the Andes.

Animism

Humans have long performed rituals for driving out, consulting, or appeasing the invisible spirits that they believe influence their own well-being and interact with the natural world of animals, plants, and objects. The concept today is known as *animism*, and its influences remain in modern language, habits, and ideas.

Animism is the name modern anthropologists gave to a very old set of ideas about how human beings and the natural world interact. The key concept is that animate and sometimes inanimate objects have a spiritual dimension that influences human well-being. The inhabitants of this invisible world of spirits behave much like ourselves, and interact with one another and with the visible world constantly. The spirits sometimes helped and sometimes defeated human purposes and hopes. Consequently, humans needed to maintain good relations with them, learn their wishes, and appease their anger whenever possible.

This idea probably dates back to the time when language developed fully among our ancestors, permitting them to create agreed-upon meanings to guide everyday behavior. And once they agreed on the importance of good relations with invisible spirits, human foraging bands probably came to rely on specialists who knew how to enter the spirit world at will and report back what the spirits wanted. Many anthropologists think that what Siberian shamans did among groups of hunters in the nineteenth century descended from and, at least loosely, resembled very ancient practices. At any rate, ritual singing and dancing allowed shamans to enter into trance at will; and when they returned to normal consciousness,

they regularly explained what the spirits wished or intended. Ordinary people could then go about their daily tasks reassured, or, as the case might be, devote time and effort to rituals designed to appease or drive evil spirits away.

The idea of an invisible spirit world parallel to the material world of sense almost certainly spread with the wandering Paleolithic bands that occupied almost all the habitable lands of the Earth between about 100,000 and 10,000 years ago. At any rate, all the diverse and remote hunters and gatherers whom anthropologists began to study in the nineteenth century believed that invisible spirits surrounded them and had a lot to do with everything that happened.

What made animism plausible was the experience of dreaming. A sleeping person might remember strange sights and encounters, even with dead persons. It seemed obvious that when humans were asleep something invisible—their spirits—could and did travel about among other disembodied spirits. Moreover, breath offered a clear example of an invisible something—a spirit—essential to life, which departed from dying persons permanently, thus joining, or rejoining, other disembodied spirits.

Trance, too, was interpreted as arising when a person's spirit departed temporarily and returned with news from the spirit world. Illness could also be attributed to an evil spirit that, by invading the body, upset normal health. Rituals for driving out such spirits and for defeating other spirits that were interfering with particular human hopes and purposes became central to what may be called animistic religion.

What is life? It is the flash of a firefly in the night. It is the breath of a buffalo in the wintertime. It is the little shadow which runs across the grass and loses itself in the sunset. • **Crowfoot, Blackfoot warrior (1890)**

Surges of unusual excitement and extraordinary cooperative efforts were also interpreted as examples of how a single spirit might enter into the community as a whole or those persons who bore the brunt of common exertion, whether they were defending their home territory against an invading human band, stalking and killing a dangerous animal, or initiating young people into their adult roles by secret and solemn rituals. These and other occasions brought people together emotionally; and the excitement that sustained commonality could be attributed to a spirit shared, at least temporarily, by all.

Details of how different peoples attempted to control their interaction with the spirit world differed endlessly from place to place and must have altered across time too, so that we ought not to assume that recent practices accurately replicated ancient patterns even among Siberian hunters. But it is worth recognizing that animism in all its innumerable local variations endured far longer than successor religions have done. In fact, animism still pervades a great deal of common speech and thinking.

Athletes and businessmen often invoke “team spirit”; musicians and actors hope for an “inspired” performance. And we all admire a cheerful “spirit,” whenever we meet such a person.

For millennia, management of relations with the spirit world in the light of animistic ideas and techniques sustained human communities in good times and bad. It made whatever happened intelligible and within limits curable as well. Every surprise and disappointment was believed to be the work of one or more spirits; and when matters were sufficiently critical, customary rituals could always be mobilized to find out exactly what kind of spirits were interfering and what sort of appeasement or change of human behavior might solve the problem.

A belief system that explained so much and served so many peoples across so many generations deserves serious respect. It was humankind’s earliest effort to work out a worldview, uniting in an undifferentiated whole what later separated into science and religion. Everything later thinkers did to elaborate human knowledge took off from animism,

Animal spirits are featured in the carvings on these two totem poles in Portland, Oregon. Beinecke Rare Book and Manuscript Library, Yale University.

modifying and eventually abandoning it; and it is not really surprising that all of us still sometimes fall back on animistic phrases and habits of thought in everyday life.

Antarctica

With most of its surface buried under two kilometers of ice, the world's fifth largest and coldest continent is inhabited by fewer than five thousand international researchers. Antarctica, the surrounding waters, and the unique ecosystem they support have been reserved for scientific research by a series of international treaties.

Antarctica is the continent of superlatives. It is the coldest, windiest, highest, driest, and remotest place on Earth. The most southerly among the seven continents and the fifth largest, Antarctica covers 14.2 million square kilometers—about the size of the United States and Mexico combined. The continent is circular in shape except for the Antarctic Peninsula, which juts out toward the tip of South America, and two major embayments, the Ross and Weddell seas.

Antarctica was long ignored, except by adventurers such as Robert F. Scott, Ernest Shackleton, Roald Amundsen, and Richard E. Byrd, who explored the region in the early twentieth century. Between 1908 and 1942, seven nations (Argentina, Australia, Chile, France, New Zealand, Norway, and the United Kingdom) decreed national sovereignty over pie-shaped sectors of the continent. None of these territorial claims, however, is recognized as lawful by any other state. During the International Geophysical Year (IGY) of 1957–1958, twelve nations (the seven claimants plus Belgium, Japan, South Africa, Soviet Union, and the United States) established more than fifty stations on the continent for cooperative scientific study. This IGY experience became the impetus for the special legal regime that today governs activities in the region.

A radiant turret lit by the midsummer midnight sun. Silver gelatin photoprint from the first Australasian Antarctic Expedition, 1911–1914. Collection of the Mitchell Library, State Library of New South Wales.

Glaciology, Geology, and Climate

The massive Antarctic ice sheet, an average of 2,000 meters thick, covers 98 percent of the continent. Only areas of the northern peninsula and the southern dry valleys are ice free. With a volume of about 30 billion cubic kilometers of water, the vast Antarctic polar ice cap contains 75 percent of the world's freshwater and 90 percent of its ice. The ice sheet is pliable and flows out like a huge glacier from a high ice-domed central plateau. This enormous ice sheet conceals the geology of the continent, which is divided into two unequal portions. The larger portion, eastern Antarctica, consists of one huge rock mass, whereas the smaller portion, western Antarctica, resembles an archipelago of mountainous islands fused together

Huskies pulling sledge during the first Australasian Antarctic Expedition, 1911–1914. Collection of the Mitchell Library, State Library of New South Wales.

by ice. Several metallic minerals, such as chromium, copper, tin, gold, lead, zinc, and uranium, are found in the Transantarctic Mountains in the peninsula region, albeit in trace amounts. Larger deposits of iron and coal are present but not in commercially recoverable quantities. No petroleum or natural gas has been discovered on Antarctica or in its circumpolar continental shelf.

Antarctica's extreme climate makes the continent a vast crystal desert. The lowest temperature ever recorded, -58.3°C , was measured at Russia's Vostok Station in July 1983, although summer temperatures can climb to 15°C on the Antarctic Peninsula. Cold, dense air blowing down from the interior polar plateau generates turbulent winds up to 160 kilometers per hour and can create blizzard-like conditions. Still, little precipitation falls in Antarctica, an average of less than 50 millimeters each year. This produces an intriguing natural paradox: Antarctica's polar ice accounts for three-fourths of the world's

freshwater resources, yet, the continent receives less precipitation than the Sahara Desert, making it the driest place on the planet.

Life Forms

The harsh climate in Antarctica produces a distinctive terrestrial ecosystem. There are eight hundred species of land vegetation, most of which are lichens. Mosses, molds, liverworts, yeasts, fungi, bacteria, and algae are also found. No herbs, shrubs, grasses, or trees exist on the continent. Animal life on Antarctica is even more scanty and primitive. No vertebrates are indigenous to the continent—there are no mammals, reptiles, or amphibians. Most animals are protozoans and arthropods, such as mites and fleas.

In southern polar seas, however, a remarkably rich biosystem thrives. Most significant among Antarctic marine life is krill, a small shrimp-like crustacean. Krill serves as the basic food for fish, whales, seals,

and seabirds in the Antarctic. Among fish in southern circumpolar seas, Antarctic cod and the Patagonian toothfish are most heavily exploited. Weddell, crabeater, leopard, and elephant seals inhabit Antarctic waters, as do porpoises, dolphins, whales, and squid. Land areas in Antarctica support huge numbers of seabirds, including albatrosses, petrels, skuas, cormorants, and terns. Most numerous are emperor and Adelie penguins, which account for 65 percent of the 200 million birds in the region.

Population and Government

No indigenous people inhabit Antarctica. Humans who live there are scientists and support personnel, and at the height of the scientific season they number fewer than five thousand. As many as fourteen thousand shipborne tourists now visit the continent annually, however. Antarctica's unique and largely pristine environment means that it can be used as a scientific laboratory platform for measuring and monitoring global processes, especially world climate change, ozone depletion, atmospheric current flow, and ocean current circulation. Science remains the principal endeavor on the continent. Such scientific research is administered by national programs and coordinated internationally through a special governance system.

The core legal agreement is the Antarctic Treaty, signed in 1959 by the twelve IGY nations. In 2009 forty-seven states are member parties. This treaty makes the continent a demilitarized zone preserved for scientific research. Although the treaty neither denies nor accepts the national claims to sovereignty in Antarctica, it does prohibit the establishment of military bases, conduct of military maneuvers, testing of any weapons (including nuclear weapons), or disposal of radioactive wastes in the area. The treaty strongly encourages freedom of scientific investigation and the exchange of scientific personnel between contracting parties.

Environmental concerns have driven the development of new international legal rules since the

Ice-cased Adelie penguins after a blizzard at Cape Denison. Photo by Frank Hurley. First Australasian Antarctic Expedition, 1911–1914. Collection of the Mitchell Library, State Library of New South Wales.

Antarctic Treaty went into force in 1961. A special measure was adopted in 1964 to foster conservation of plants and animal life on the continent. There followed in 1972 a convention to conserve and protect Antarctic seals, and in 1980 came a special agreement for the conservation of Antarctic marine living resources, specifically to control commercial harvests of krill and finfish in circumpolar seas. A treaty to regulate development of Antarctic mineral resources was negotiated during the 1980s but disintegrated in 1989, mainly because of political opposition from environmental groups. During the late 1980s and early 1990s anxiety arose among environmentalists over increasing pollution on the frozen continent. Although the threats of mineral development and increasing tourism to the Antarctic were aggravating, the real concern was the increasing amounts of garbage, sewage, and chemical wastes generated by scientists and support personnel in forty scientific stations. These wastes were not being disposed of by being returned to their original continents. Rather, they were being buried in landfills, stored in metal barrels, incinerated in the open air, or dumped into circumpolar waters. To foreclose the possibility of mineral development, but also to address these pollution concerns, a special environmental protection protocol

to the Antarctic Treaty was agreed to in 1991. That protocol provides for comprehensive regulation over activities affecting the Antarctic environment; it became binding on Antarctic Treaty governments in 1998, establishing principles for conducting human activities in the Antarctic and integrating various recommendations, codes of conduct, and guidelines into a coherent, obligatory legal whole. Significantly, the protocol bans mineral development, which includes drilling for oil and natural gas, onshore or offshore. Five annexes accompany the protocol. These set procedures for environmental-impact assessment, restate the need to conserve Antarctic fauna and flora, set standards for waste disposal and waste management, fix rules to prevent pollution from ships in Antarctic waters, and expand the Antarctic protected area system. Although this protocol and its annexes contribute much to environmental protection and resource

conservation in the polar south, the treaty system will continue to evolve to deal with new Antarctic environmental concerns, such as increasing tourism, land-based pollution, and global warming.

Anthropocene

Human activities have become so pervasive and profound that they rival the great forces of nature and are pushing the Earth into planetary terra incognita. Some geologists believe that the Earth has now left its natural geological epoch—the interglacial state called the Holocene—and is rapidly moving into a less biologically diverse, less forested, much warmer, and probably wetter and stormier state, the Anthropocene.

In 2000, and then more formally in the journal *Nature* in 2002, Paul J. Crutzen, a Dutch Nobel Prize-winning atmospheric chemist, argued that in about 1800 the world entered a new geological epoch, the Anthropocene. This was the era in which our own species, without intending to do so, and without even understanding what was happening, became not just a significant force for change within the biosphere, but perhaps *the most important single force* for change within the biosphere.

Impressed by these arguments, several geologists have proposed that the Anthropocene be formally recognized as a new geological period. At present, we live in the Holocene epoch, which began in 10,000 BP (before present). If the new proposal is accepted, the Holocene era will be designated as having ended in 1800 CE, and the Anthropocene will be designated as the epoch to follow. The date 1800 is an appropriate starting point for the Anthropocene; that is when the global concentration of major greenhouse gases—carbon dioxide and methane—began to rise significantly. It is no accident, therefore, that the new epoch coincides with the invention and spread of the improved James Watt steam engines, and with conventional dates for

the beginnings of the Industrial Revolution. From an ecological point of view, the beginning of the Anthropocene offers a powerful marker for the beginnings of the modern era of human history.

In a controversial 2005 study, the paleoclimatologist William Ruddiman proposes a different periodization. He argues that through deforestation and the spread of domesticated livestock and wet rice farming, humans may have been shaping the atmosphere on global scales for as long as 8,000 years by raising atmospheric levels of carbon dioxide and methane. He suggests that these changes prevented the early return to a new Ice Age and allowed the great agrarian civilizations of human history to flourish. In other words, human activity created the global climatic conditions that allowed the world's major agrarian civilizations to flourish during the last 5,000 years. Ruddiman's arguments may be overstated, but even so, they suggest that the Anthropocene is not just a byproduct of modernity, but had roots many millennia in the past.

The idea of the Anthropocene (like its conceptual partner, the *anthroposphere*) has much to offer world historians. First, it highlights the remarkable fact that our species, *Homo sapiens*, is the first single species in the history of the entire planet to have had a significant impact on the biosphere as a whole. Earlier in the planet's history, large groups of organisms such as early photosynthesizing bacteria created the Earth's oxygen-dominated atmosphere. But as far as we know, no single species has ever had such a profound impact on the biosphere. The idea of the Anthropocene therefore highlights our uniqueness as a species, and the power of our capacity for sustained ecological innovation.

The idea of the Anthropocene also offers a powerful tool for thinking about some of the dominant features of modern world history. It highlights the astonishing scale of the changes that have transformed our relationship to the biosphere in the last two hundred years, and the many contemporary challenges those changes have created. And by doing so it suggests that there is an objective basis for the claim that world history did indeed enter a new era at about 1800, the time of the fossil fuels revolution. Finally, the idea of the Anthropocene highlights the profound importance of environmental history to world history in general.

Anthropology

Through four distinct, often conflicting traditions—biological, archeological, sociocultural, and linguistic—anthropologists attempt to reconstruct human prehistory and the divergence of the human races. But because the traditions are filtered through vastly different paradigms, borrowing from anthropology can lead historians to a distorted historical model.

The global scope and trans-epochal sweep of anthropology bespeak close affinities with world history. Yet, just what anthropology has to offer world history is far from straightforward. In no small part, this is because anthropology, even more than most disciplines, is a sutured and unstable bundle of paradigmatic traditions, famously involving studies of human biology and primate origins (in biological anthropology), a significant focus on the Neolithic era across the globe (in archaeology), detailed studies of daily life, particularly in small-scale societies (in sociocultural anthropology), and formal analyses of language in all its known diversity (in linguistic anthropology). Work in these different quadrants has distinct, and in some cases antithetical, implications for world history.

Anthropology as a Discipline

Though no single starting point can be found for sustained inquiry into the questions asked by anthropology, anthropology coalesced as a discipline only in the final decades of the nineteenth century, as part of a larger process of disciplinary differentiation and institutionalization. Within this larger process, the composition of anthropology was shaped to a significant

degree by “the revolution in human time,” itself located at the end of the 1850s and beginning of the 1860s. The new understanding of the length of human existence, as vastly greater than the biblical chronology of some six thousand years, undermined the then active scholarly project of reconstructing the complete family tree of humankind, from the first beget of the original hetero couple (Adam and Eve) to the distribution of peoples across the entire globe in the present.

In its place, scholars pursued a “conjectural” account of humanity’s “progress” over the vast expanse of human time, through a singular sequence of generalized stages, from primordial savagery to the telos of civilization. Within this new research program, living “primitives” and archaeological remains (both skeletal and artifactual) came to be seen as the best sources of evidence for reconstructing the prehistoric and precivilized segment of this sequence, given the absence of written records from this period of time-development.

In the earlier project of reconstructing the complete family tree of all the world’s peoples, the study of language had played a prominent role, in the form of philology. The latter’s great prestige positioned language as a significant focus of the new social evolutionary program as well. Within the new research program, however, the interest in language shifted from finding cognates that demonstrated a common source language (a node on the family tree) to establishing an authoritative basis for ranking all languages on a single scale of development.

The new understanding of human time contributed in one other important way to the formation of the new discipline of anthropology: it opened the door to a vast expansion of research on “the races of

Mankind are so much the same, in all times and places, that history informs us of nothing new or strange in this particular. Its chief use is only to discover the constant and universal principles of human nature. • **David Hume (1711–1776)**

mankind.” Within the tight temporal confines of the biblical chronology, a coherent exposition of independent racial types required the doctrine of polygenism (the idea that each race had been created separately by God), but most scholars in Europe and North America had rejected this doctrine because it was held to contradict the biblical account of the creation of humankind. The new chronology, by contrast, offered no such barrier to the idea of independent racial types, and indeed it provided a span of time that seemed more than ample for the formation of racial divisions, even if all the races had a common origin.

Finally, this pair of new scientific pursuits—the reconstruction of human prehistory and the study of human racial differences—were linked in at least two important ways. First, they relied on common sources of evidence—archaeological remains and accounts of living “primitives.” This common (evidentiary) denominator did much to make these areas of research mutually intelligible, thereby facilitating their cohabitation in a single discipline. Second, these pursuits were linked by service to a common master: empire. What this facilitated was less scholarly communication between these areas of research than an ad hoc intermingling of racial and social evolutionary notions in the common cause of legitimating conquest and domination.

Given the breadth of anthropology as it coalesced in these ways, it is not surprising that few, if any, Victorian scholars were prepared to carry out original research in all of the discipline’s many branches. It is a great irony, moreover, that one of the very first scholars who was prodigious enough to do so—Franz Boas (1858–1942)—was also one of the last. That Boas made significant contributions to all four of anthropology’s “quadrants” is a commonplace of introductory courses in anthropology, but what is typically elided in these accounts is that his contributions to biological (or in his terms, *physical*) anthropology were primarily negative. Boas’s painstaking research on racial kinds produced results that, again and again, raised fundamental questions about the validity of the concept of race. So too, Boas’s work on social evolution ended up challenging the idea that living others

could be seen as exemplars of prehistoric life. This critical response to social evolutionary theory was particularly strong in the case of language, with Boas and his students providing powerful demonstrations that all observable human languages were equally “evolved.” Thus, as much as Boas played a central role in the building of anthropology, he also animated the discipline’s characteristic centrifugal tendencies.

World History and Anthropology

In the last half century, as world history has emerged in tension with disciplinary history’s disproportionate focus on Europe and the West, world history has looked to anthropology for two primary reasons: (1) to bring into history knowledge of Africa, Asia, Oceania, and the indigenous peoples of the Americas, and (2) to gain a significant degree of temporal depth, by moving into prehistoric time. What has been insufficiently recognized, however, is that in consulting anthropology for these reasons, world history has drawn on bodies of “anthropological” knowledge that are shaped by quite different, and often antithetical, theoretical schemas or paradigms. Most Neolithic archaeology, for instance, relies upon and incorporates a social evolutionary framework; as such, this body of “anthropological” knowledge supports the perception of there being an overall trajectory to human existence through time. It thereby complements and reinforces disciplinary history’s entrenched assumption that the history of Europe exemplifies a universal passage from “traditional” to “modern” social forms: a passage that will sooner or later occur everywhere else, in much the same way. By contrast, most post-Boasian cultural anthropology incorporates and supports the rejection of social evolutionary models. This body of “anthropological” knowledge characteristically speaks against the validity of such analytic categories as “advancement” and “civilization,” while encouraging the *provincializing* of Europe and the West (cf. Chakrabarty 2000). When this knowledge is brought into disciplinary history, it becomes quite difficult to hold on to a single, coherent narrative of the human career through time. Similarly, if more

abstractly, the radical relativizing that is characteristic of post-Boasian cultural anthropology—its insistent practice of doubting the absoluteness of the familiar—discomfits disciplinary history’s common-sense realism.

In sum, recognizing the complexity of the discipline we call anthropology should caution us against the view that anthropological knowledge can, in any simple way, be brought into history to provide greater coverage of human time and space. Such interdisciplinary borrowing must be alert to the diverse paradigmatic traditions at work in anthropology, as well as their quite different relationships to disciplinary history’s own theoretical schemas.

Anthroposphere

The *anthroposphere*—we humans together with our environment—addresses the degree to which we, as opposed to other life forms, have impacted and penetrated the biosphere. The concept, introduced in the late twentieth century, proposes that monopolies of human power throughout history, such as agrarian and industrial regimes, have deeply affected the relations between humans and the nonhuman world.

The concept of *anthroposphere*, like the concept of *biosphere* from which it derived, was first introduced in the natural sciences in the late 1980s and early 1990s. The term refers to that part of the biosphere that is affected by humans—just as the part of the biosphere that is affected by elephants could be called *elephantosphere*. Such terms are all predicated on the idea that there is a two-way relationship between every living species and the environment in which it lives. All life is part of an ecosystem, all ecosystems together constitute the biosphere—the total configuration of living things interacting with one another and with nonliving things. Every form of life continuously affects, and is affected by, its ecosystem—and human life is no exception.

Anthroposphere is an open concept, containing suggestions for research and reflection, sensitizing us to the problem of how far and how deeply the impact of human activity has penetrated into the biosphere. By reminding us that human societies are embedded in ecosystems, the concept helps to bridge the gap between the natural sciences and the social sciences and humanities. Moreover, it can be used to formulate and elucidate the simple but far-reaching proposition that many trends and events in human history,

from its earliest beginnings to the present day, can be seen as functions or manifestations of the expanding anthroposphere.

Extensive and Intensive Growth

The anthroposphere emerged with the evolutionary transition from hominids to humans. Initially, expansion must have been very slow and replete with regressions. In the long run, however, the human population grew in numbers from modest beginnings to 6.79 billion in 2010, and it spread from its origins in northeastern Africa over increasingly more territory, until it was a significant presence on every continent except Antarctica. Together these two forms of expansion represent extensive growth. *Extensive growth* can be defined as sheer extension of biomass, physically and geographically. It is a matter of proliferation: more of the same, reaching farther and farther—like rabbits in Australia or cancer cells in a human body.

In the expanding anthroposphere, extensive growth has always been accompanied, and in all likelihood even driven, by intensive growth. If extensive growth can be defined in terms of more and more, intensive growth refers to the emergence of something new. In the case of the anthroposphere, it arises from the human capacity to find new ways of exploiting energy and matter by collecting and processing new information. If the key word for extensive growth is proliferation, the key word for intensive growth is differentiation—its primary effect always being to add new and different items to an existing stock or repertoire. Once an innovation has been accepted, it may then be copied in multiple forms and grow extensively. Thus intensive growth and extensive growth

intermingle. (Like the concept of anthroposphere and other central concepts used in this article, such as agrarianization and industrialization, the concepts of intensive and extensive growth are intended not to express any value judgments.)

Learning as a Source of Power

Human life, like all life, consists of specific combinations of matter and energy structured and directed by information. Two particular features distinguish human life from other forms of life and hence are important in understanding the anthroposphere. First, humans rely much more strongly on learned information than any other species. Second, most of the information that human individuals learn comes from other individuals: it is information that has been pooled, shared, transmitted—it is, in a word, *culture*.

The most important vehicle for human communication is language, composed of symbols. Symbols therefore constitute a vital dimension of the anthroposphere. Information conveyed in symbols can be handed down from generation to generation and used to aggregate and organize matter and energy in the service of human groups, thus strengthening the position of those groups in the biosphere. The development of language made it possible for humans to adopt new forms of behavior that made them increasingly different from other animals. A strong reason for maintaining the new forms of behavior must have been that they gave humans the advantage of greater power over those other animals.

This seems to be one of the clues for understanding the course of the long-term development of the anthroposphere. Again and again, innovations occurred, like mutations in biological evolution, and again and again, of those innovations, those tended to be retained that helped increase the power of the groups that maintained them. As humans increased their power through such innovations as language and the mastery of fire, other animals inevitably declined in power. Some became extinct, while all surviving species had to adjust their ways of life to the newly gained superiority of human groups. At later stages,

similar shifts in power relations occurred within human society itself, compelling defeated groups to adjust to the dominance of more successful groups. Many innovations in the history of human culture were adjustments to power losses.

Differentiation: Regimes

The domestication of fire culminated in the establishment of what may be called a monopoly—a monopoly of power that was held by the human species and in which eventually all human communities of the world shared. The formation of this monopoly affected the relations between humans and the nonhuman world so deeply that we may call it the first great ecological transformation brought about by humans, which was followed much later by two similar transformations—generally known as the agricultural and industrial revolutions, and more precisely characterized by the long-term processes of agrarianization and industrialization.

Each of the three transformations marked the formation of a new socioecological regime (that is, a form of social organization and a way of life attuned to a specific level of control over matter and energy): the fire regime, the agrarian regime, and the industrial regime, respectively, marked by the utilization of fire and elementary tools, the rise and spread of agriculture and animal husbandry, and the rise and spread of large-scale modern industry. The later regimes did not make the earlier regimes obsolete; rather, they absorbed them and, in so doing, transformed them.

With each new regime, new monopolies of human power were formed, opening up new opportunities for control, security, comfort, and wealth. All these benefits, however, involved costs. This was already evident when the fire regime exerted pressure on people to collect fuel and to tend their hearths; it became even more evident when the strains of the agrarian and industrial regimes were added to the fire regime.

Four Phases of Human History

The most convenient backdrop for writing history is undoubtedly chronology. When it comes to dealing

"It's a question of discipline," the little prince told me later on. "When you've finished washing and dressing each morning, you must tend your planet." • **Antoine de Saint-Exupéry (1900–1944), from *The Little Prince***

with such encompassing long-term processes as the expansion of the anthroposphere, however, one can also speak fruitfully in terms of broad phases. By taking as benchmarks the successive formation of the three major socioecological regimes, we can distinguish four phases in human history:

1. The phase before the domestication of fire. In this phase all human groups subsisted on foraging; there were no groups with fire or cultivated fields or factories.
2. The phase when there were at least some groups with fire, but none yet with fields or factories.
3. The phase when all human groups had fire and some also had cultivated fields, but none had factories.
4. The phase we have reached today, when all human societies have fire but are also using products of fields and factories.

Of course, it would make a great deal of difference for a group of foragers whether it found itself living in the first, second, third, or fourth phase, as in the first it would come in contact only with other groups that had basically similar skills. In any of the subsequent phases, however, it might come in contact with groups whose skills made them more powerful than the foragers. As a further elaboration of this simple model of four phases, we may subdivide each phase into three subphases: a phase when there was no group with the defining technology (fire, agriculture, or industry), a phase when there were both groups with and groups without the defining technology, and a phase when there were only groups with the defining technology. Making these finer gradations in the four phases raises the intriguing problem of how to account for the transitions from one subphase to the next. How was a particular regime first established, how did it spread, and—most intriguing—how did it become universal?

The last question in particular brings out the world-historical import of the phase model. Besides being applicable to the three major socioecological

regimes, the questions also apply to the adoption of other innovations, such as metallurgy, writing, and the development of cities.

Agrarianization

The history of the past ten thousand years may be read as a series of events accompanying the agrarianization of the anthroposphere—a process whereby human groups extended the domain of agriculture and animal husbandry all over the world, and in so doing made themselves increasingly more dependent upon this very mode of production.

The agrarian way of life was based on a new human monopoly—the monopoly of control over pieces of territory (fields)—in which people more or less successfully subjected vegetation and animal life to a human-directed regime. The result was twofold: elimination of competing species (parasites and predators) and concentration of resources and people in ever-greater densities. Although agrarian regimes sometimes suffered decline, their overall tendency was to expand.

Expansion did not take place in a uniform and even fashion. In fact, the unevenness of its development was a structural feature of agrarianization. From its very beginnings, agrarianization was marked by differentiation—initially between people who had adopted agriculture and people who had not. Eventually, in the phase of industrialization, the last nonagrarian peoples vanished, and with them this primary form of differentiation.

Still, various forms of differentiation within the agrarian (or, rather, agrarianizing) world continued. Some agrarian societies went much further than others in harnessing matter and energy for human purposes, for example, by means of irrigation or plowing. In societies that grew accustomed to higher yields of agrarian production, competition to control the wealth thus generated usually led to social stratification—the formation of different social strata marked by huge inequalities in property, privilege, and prestige. Another closely related form of differentiation typical of this phase was cultural diversification. In Mesopotamia, the Indus Valley, northeastern China,

Egypt, the Mediterranean basin, Mexico, the Andes region, and elsewhere, agrarian empires developed that are still known for their distinct cultures, each with its own dominant language, system of writing, religion, architecture, dress, methods of food production, and eating habits. In the heyday of agrarianization, the anthroposphere was marked by conspicuous differences in culture or civilization—differences resulting to a large extent from the interplay of gains in power by some groups and accommodation to power losses by others.

Industrialization

Around 1750 the immense deposits of fuel energy that had lain virtually unused by any living species began to be exploited for human purposes. A series of innovations provided the technical means for tapping these supplies and for using them to generate heat and mechanical motion. No longer were people completely dependent on the flows of energy that reach the Earth from the sun and that are partly converted into vegetation by means of photosynthesis. Just as at one time humans had been able to strengthen their position in the biosphere by learning to control fire, they now learned the art of using fire to exploit the energy contained in coal, oil, and gas.

These innovations stimulated great accelerations in extensive growth. According to a rough estimate, the total human population must have reached 1 million at some time in the Paleolithic, 10 million at the time when agrarization began, 100 million during the first stages of urbanization, 1,000 million at the beginning of industrialization. The next tenfold increase, to 10 billion, is expected to be completed within a few generations. Along with the increase in human numbers, networks of production, transport, and communication have grown worldwide so that the anthroposphere is now truly global. Universal acceptance of a common system of time measurement, based on Greenwich Mean Time, is a telling example of how common standards of orientation are spreading all over the world. At the same time, the inequalities between and within human societies that arose as structural features of advanced agrarian

regimes persist in industrial society. Those inequalities now also exert disturbing global pressures, as do imminent ecological problems such as global warming, which are generated by the way in which the anthroposphere is currently expanding.

Toward a Synthesis

In the eras of agrarianization and industrialization, the anthroposphere gave rise to social regimes that were only indirectly related to the natural environment. The money regime and the time regime may serve as illustrations. Both exemplify how people turned their attention away from the natural environment, and from ecological issues, toward a more purely social aspect of the anthroposphere, represented by the clock and the calendar or the purse and the bank account. Those regimes thus supported the illusion that the anthroposphere is autonomous. That illusion was furthered by the concomitant intellectual tendency to separate the social sciences from the natural sciences and to cultivate discrete and seemingly autonomous social-science disciplines, such as psychology and sociology.

Today there is a growing awareness that as the anthroposphere encroaches upon ever larger portions of the biosphere, it absorbs more and more nonhuman elements. The notion of ecological interdependence is gaining ground. A classical theme in the social sciences has been the interweaving of planned actions and unplanned consequences. All human activities have unintended consequences; recognition of that fact is now being combined with the insight that the anthroposphere (itself the product of unplanned evolutionary processes) has become an agent in the evolution of the biosphere. Human life has become a formidable co-evolutionary force. Sociocultural processes are channeling and steering the course of biological evolution.

Without using the word *anthroposphere*, the world historians William H. McNeill and J. R. McNeill, the ecological historian Alfred Crosby, the biologist Jared Diamond, and several others have shown that it is possible to write about the history of the anthroposphere. Further theoretical inspiration can be

drawn from the traditions of sociology and anthropology inaugurated by Auguste Comte and Herbert Spencer and continued by such scholars as Norbert Elias and Marvin Harris, in combination with the geological and biological study of the biosphere as launched by Vladimir Vernadsky in the early twentieth century and taken up again by Lynn Margulis and James Lovelock from the 1970s onward. The names mentioned are but a few among many authors whose works contribute to our understanding of the history and dynamics of the anthroposphere.

Apartheid

The racial segregation in South Africa known as *apartheid*, in place for nearly fifty years, faced resistance from the beginning, causing the country to lose its U.N. vote and its Olympics slot. Apartheid finally ended in 1991, and South Africa has been working to repay and repair emotional damages incurred by the white minority's supremacy over the black majority.

Apartheid is an Afrikaans word meaning “apartness” or “separateness” and refers to a system of racial segregation practiced by the white minority against a black majority in the Republic of South Africa from 1948 to 1991. In the late twentieth and early twenty-first centuries the term has acquired a generic meaning, much like *holocaust* and *diaspora*, and is used to describe other situations around the world in which one group of people deny basic human and civil rights to another group based on gender, race, or sexual orientation. Thus, one hears of apartheid against women in Taliban-controlled Afghanistan, apartheid against Palestinians in areas controlled by Israel, and apartheid against homosexuals in various countries.

Early Years

The notions of white supremacy and racial segregation came to South Africa with the first European settlers. The Dutch East India Company imported slaves from East Africa and Malaysia soon after establishing a small colony at the Cape of Good Hope in 1652. Although the British abolished slavery shortly after annexing the Cape Colony in 1806, they maintained various institutions and practices that guaranteed

white political and economic control over the black majority. By the early twentieth century Britain controlled all of modern-day South Africa, with political power nearly entirely in the hands of people of European descent. With the Act of Union in 1910, South Africa gained dominion status within the British Empire and limited self-rule. Between 1910 and 1948 Union governments passed numerous laws that severely restricted black rights. Blacks were denied equal citizenship through such measures as pass laws (laws requiring blacks to carry identification pass books), job reservations, restricted voting rolls, and the right to form unions. The Native Areas Acts of 1913 and 1936 relegated the African majority to native reserves, forcing roughly 85 to 90 percent of the population in theory (although never in fact) to live on less than 14 percent of the land. The remaining 86 percent of the land was reserved for whites only.

Thus, when Daniel F. Malan (1874–1959) and his Afrikaner Nationalist Party won the 1948 general election on a platform that officially endorsed apartheid, the concept was not alien to either the white or black populations. Ironically, at a time when Europe and North America were ending legalized discrimination against racial minorities, white South Africans began to implement one of the harshest, most total systems of racial discrimination in world history.

Structure

The philosophy of apartheid was based on four major points: the “separate development” of the four official racial groups in the country; white control of every aspect of government and society; white interests overruling black interests, with no requirement to provide

An aerial photo taken in South Africa shows how apartheid looked in practice: the “white” town of Graaff-Reinet (center) and “colored” townships (upper left and upper right).

equal facilities for all groups; and the categorization of “whites” (people of European descent) as a single nation and Africans as members of several distinct nations or potential nations.

Under apartheid there were four official racial groups. The Africans (sometimes designated as Bantu) made up about 78 percent of the total population and, although of common ancestry, were divided into nine distinct nations: Zulu, Xhosa, Venda, Tsonga, Pedi, Tswana, Swazi, Ndebele, and Sotho. *Colored* was the name given to people of mixed black, Malayan, and white descent who traced their origins to the earliest days of European settlement. Asians, mainly of Indian ancestry, were a third official group. Coloreds and Asians made up roughly 10 percent of the population. The remaining 12 or 13 percent were whites, with about 60 percent of Dutch descent and 40 percent from the British Isles, although immigrants from nearly every European nation were represented in this single “nation.”

The apartheid system was sometimes described as having two aspects, so-called grand and petty apartheid. Grand apartheid refers to those racially discriminatory policies that related to land and politics. Petty apartheid refers to the everyday examples

of racial discrimination, such as marriage restrictions and segregated facilities and amenities, housing, jobs, transportation, and education. During the first decade following the 1948 elections, apartheid policies developed in a rather crude manner under the label of *baaskap*. This Afrikaans term roughly translates as “mastery,” or white supremacy, with a very explicit notion of a master (the “boss”) and servant relationship between white and black. The Afrikaners’ obsession with cultural survival and almost pathological fear of the *swart gevaar* (“black peril”) resulted in a series of laws enforcing strict segregation and white supremacy. These included the Prohibition of Mixed Marriages Act (1949); the Immorality Act (1950), which made sex between people of different racial groups illegal; the Population Registration Act (1950), requiring everyone to be registered in one of the official groups; the Group Areas Act (1950); the Suppression of Communism Act (1950), which effectively identified anyone who opposed the government as a Communist; the Reservation of Separate Amenities Act (1953); and the Bantu Education Act (1953). This last denied government support to private and church-run (often mission) schools and placed the entire national education system under the government’s direction, resulting in a significant decline in the quality of black education.

The Baaskap Period and Hendrik Verwoerd

During this *baaskap* period, the apartheid government set about enforcing a strict separation between the races in urban areas. Thousands of Africans, Asians, and coloreds were forcibly removed from so-called white areas and relocated to dreary, desolate townships outside the cities. These harsh measures are best exemplified by the forced removal of an entire colored community living in “District Six” in Cape Town, and the destruction of the African township of Sophiatown, near Johannesburg, which was then rebuilt as a white town, to be renamed Triomf (Afrikaans: “Triumph”). It is estimated that from the passage of the Group Areas Act in 1950 to

the end of forced removals in the late 1980s, more than 3.5 million people were forcibly relocated by the government.

In 1958 Hendrik Verwoerd (1901–1966) became prime minister. He is remembered as the chief architect of apartheid. Under Verwoerd, apartheid evolved away from *baaskap* and toward a more sophisticated racist policy called separate development. Under separate development, each of the nine African (or Bantu) groups was to have its own nation, or Bantustan, located roughly on the 14 percent of land set aside in the Native Land Acts of 1913 and 1936. The remaining 86 percent of the country was reserved for whites only; that land included the best farmland, the main urban areas, and major mineral deposits and mines. The underlying philosophy of separate development was that Africans should return to their independent homeland, and there develop socially, economically, culturally, and politically according to their own freely determined desires. The argument went that in this way, all South African nations—the white “nation” and the nine black “nations”—would have self-determination and not be forced to live under alien rule.

Self-determination only began, however, once the Africans entered their homeland. They were not given a choice of whether to move or not, though many of them had lived for generations in cities and never been near their designated homeland. Furthermore, many Africans came from diverse ancestries, with (for example) a Xhosa grandfather and a Sotho grandmother, or some other combination of the nine different groups. Now, however, they found themselves with a pass book that officially labeled them as belonging to one group or another and as citizens of that homeland. They were aliens in South Africa—a country that theoretically now had a white majority population.

Verwoerd’s policy of “separate development” raised apartheid to a new level of systematized racism. This began the era of truly “grand” apartheid: not only did the petty racism of “whites only” park benches and beaches affect everyday life, now every moment of one’s life was determined by one’s racial

A Namibia monument commemorates fallen SWAPO soldiers who were killed by the South Africans at the beginning of the independence proceedings on 1 April 1989.

classification, from racially designated hospitals for one’s birth to racially designated cemeteries for one’s burial. Coloreds, Asians, and Africans could not move freely about the country, could not freely choose their place of residence or employment, and could not vote or own land. African workers in cities and on the mines were considered transients, and had to return regularly to their “homeland.” Only those with permits could live in “white” areas, and they were not allowed to bring with them their spouse or family, thus contributing to the breakdown of African family life. Blacks were forced to live in African, Asian, or colored townships on the perimeter of urban areas. Africans, coloreds, and Asians (but not whites) were required at all times to carry pass books, known as “Books of Life” because they contained all of a person’s identity, including marriage and driver’s licenses, birth certificate, and work permit.

In 1963 the apartheid regime granted the first of the Bantustans, the Transkei (a Xhosa “homeland”), limited self-government. Between 1976 and 1981, the Transkei, Bophuthatswana (Tswana), Venda (Venda), and Ciskei (Xhosa) were granted “independence” by the government, although no other government in the world ever recognized these “nations.” KwaZulu, KwaNdebele, Lebowa, KaNgwane, Gazankulu, and Qwa Qwa were declared “self-governing” in the 1970s. None of the homelands were ever economically viable. They consisted mostly of poor, eroded

land; few had any mineral deposits of note, urban areas, or industry. Families were left dependent on migrant laborers to send home their earnings from work in white areas. All of the homelands were abolished in 1994 and the land reincorporated into the Republic.

Opposition

Opposition to apartheid began immediately after the 1948 elections. Armed with the Suppression of Communism Act, which, despite its racist policies, earned South Africa support during the Cold War from the United States and Great Britain, the apartheid regime successfully crushed most resistance, however. The leading black opposition group was the African National Congress (ANC), whose members included Albert Luthuli (1898–1967; winner of the 1961 Nobel Peace Prize), Walter Sisulu (1912–2003), Oliver Tambo (1917–1993), and Nelson Mandela (b. 1918). In 1955 a Congress of the People adopted a Freedom Charter that called for a multiracial, democratic South Africa; the charter was adopted by the ANC.

By the early 1960s, as dozens of African nations gained their independence, South Africa faced increasing international condemnation. In 1961 South Africa left the British Commonwealth rather than abandon apartheid. In that same year the Dutch Reformed churches of South Africa left the World Council of Churches. South Africa also lost its vote in the United Nations and was banned from the Olympic Games as well as many international organizations. Under the leadership of Nelson Mandela, the ANC formed a military wing in 1961, Umkonto we Sizwe (“Spear of the Nation”) that resorted to violence in its resistance to apartheid. In 1963 Mandela and seven others were arrested and sentenced to life imprisonment.

The government now banned nearly all opposition organizations and placed many individuals either in prison or under house arrest. Verwoerd was assassinated in 1966, and under his successor, John Vorster (1915–1983), some aspects of petty apartheid were relaxed. The government’s decision in 1976 to require

mandatory instruction in Afrikaans in black schools, however, sparked off riots, first in the black township of Soweto and then across the country. The following year South African police murdered the Black Consciousness leader Steve Biko (1946–1977). In 1978, P. W. Botha (1916–2006) became prime minister and, while continuing to relax many apartheid policies, he took a tough stand against any opposition to the government. He also began to tinker with the apartheid system, giving coloreds and Asians limited political rights. He hoped thereby to co-opt these two groups, appease world opinion, and allow whites to remain in power.

Following Zimbabwe’s independence in 1981, South Africa and Namibia were the only remaining white-ruled countries in Africa, and tremendous pressures were building, both internally and externally, for change. South Africa faced increasingly strict international economic sanctions, which included U.S. corporations’ divestiture of their South African holdings. Internally, the need for more skilled labor led to the lifting of limits on black wages and the legalization of black labor unions with the right to strike. These and other factors required more than cosmetic changes to the apartheid system.

The End of Apartheid

In 1989 F. W. de Klerk (b. 1936) became prime minister and immediately announced the release of many black political prisoners. In February 1990 he declared in Parliament that apartheid had failed, that the bans on all political parties would be lifted, and that Nelson Mandela would be released after twenty-seven years of imprisonment. In 1991 all the remaining apartheid laws were repealed. After three years of intense negotiation, all sides agreed in 1993 to a framework for a multiracial, multiparty transitional government. Elections were held in April 1994, and Nelson Mandela became the first freely elected, majority president in South African history. In 1995 President Mandela formed a Truth and Reconciliation Commission, with Nobel Peace Prize winner Archbishop Desmond Tutu

Segregation is the adultery of an illicit intercourse between injustice and immorality. • **Martin Luther King Jr. (1929–1968)**

(b. 1931) as chair, to investigate human rights abuses suffered by the South African people under apartheid. The commission's stated purpose was not to punish but to help the country come to terms with its past, making it unique in human history. In 2003 President Thabo Mbeki (b. 1942, in office 1990–2008) announced that the South African government would pay 660 million rand (around \$85 million at the time) to about 22,000 people who had been detained or tortured, or who were surviving family members of those murdered during the apartheid era.

Arab Caliphates

The leaders of the Sunni Muslims, or caliphs, were responsible for defending and expanding Islam, but their power extended to political, military, and financial policy as well. Each distinct series of caliphs—called the Pious caliphate, the Umayyad caliphate, or the Abbasid caliphate—was known for its policies and differing contributions to the Islamic world.

The word *caliphate* is derived from the Arabic word *khalif* (meaning “successor” to the Prophet Muhammad). Because Muhammad (570–632 CE) had not nominated anyone to succeed him as political and military leader of the growing Muslim community that he had established in Arabia, the question of who would succeed him divided his followers. One group of followers wanted to elect a man named Abū Bakr through majority allegiance. He was the father of ‘A’isha, one of Muhammad’s wives. Members of this group were called “Sunnis” because they followed the *sunnah* (the way of Muhammad). Muhammad himself used consultation and listened to majority views in temporal affairs. Another group of followers, who later became known as “Shi’as” (partisans), wanted a man named Alī to succeed Muhammad because Alī was a blood relative and the son-in-law of Muhammad. This rift was the first among Muslims and divided them into two major groups: Sunnis and Shi’as. The Sunni leaders were called “caliphs,” and the Shi’i leaders were called “imams” (religious guides).

Caliphate rule varied in the early Islamic world, which stretched from Spain to Syria. Although caliphs differed in style, they all were expected to keep Muslims united, repel threats to Islam, and continue the expansion of Islam in their respective areas. Despite

their expected championship of Islam, caliphates were characterized more by political, military, and financial administration than by religious fanaticism because most Islamic lands protected their religious minorities such as Jews and Christians.

Different caliphates became known for different achievements. Some became known for expanding the realms of Islam, others for achieving great artistic heights, revolutionizing natural sciences, and creating the first institutions of higher education.

Muslim scholars, scientists, and statesmen conceived new ideas and institutions. They also, however, improved upon their conquered subjects’ artistic and scientific achievements, which were the result of thousands of years of experience in different regions that now came under Islamic rule. Synthesis and syncretism (the combination of different forms of belief or practice) also changed Muslim rulers’ outlook in political, socio-economic, and military matters.

The Pious (or Orthodox) caliphate (632–656) was the collective rule of the first four caliphs: Abū Bakr, ‘Umar, Usman, and Alī. These “Pious” caliphs were the first companions and relatives of Muhammad. With the exception of Abū Bakr, they were assassinated, plunging Muslims into violent sectarianism and civil wars.

Abū Bakr established caliphal standards and expectations in a memorable speech that he delivered to Muslims immediately after receiving their trust and allegiance. He said, “O People! You have chosen me as your Chief, although I am not the best among you. I need all your advice and all your help. If I do well, support me; if I make a mistake, then set me right. To tell the ruler truly what you think of him is faithfulness; to conceal the truth is treachery. As long

as I obey God and His Prophet, obey me; wherein I disobey, obey me not.”

During the Pious caliphate Islam spread out of the Arabian Peninsula to Iraq, Syria, and Persia (Iran) in the east and to Palestine, Egypt, and northern Africa in the west. The fall of Sicily and Spain in western Europe and the fall of the Byzantine Empire in eastern Europe were coming soon. The Pious caliphate consolidated Islamic doctrines, compiled the Qur'an into one standard book (eliminating possible textual variations), created financial institutions that supported their welfare states, and set standards for future political and military rule.

The Umayyad caliphate, which was founded by the Banu Umayya family of Mecca, Saudi Arabia, ruled Syria (661–750) and Spain (756–1031). The Umayyads brought vast agricultural lands under their military control and created a fierce feudal aristocracy who trampled the rights of former landowners even though some of them had converted to Islam. To increase agricultural yield, the Umayyads extended irrigational networks, experimented with new and imported seeds, and regularized peasantry and tenancy. Expansion of the agricultural base further increased trade and business, leading to the rise of great cities such as Damascus. Muslim commercial links connected the Middle East with the Far East.

The same phenomenal rise in agricultural and commercial economy created towns in Islamic Spain such as Granada, Cordova, and Toledo, which became centers of advanced culture, higher education, and unprecedented religious tolerance among Muslims, Christians, and Jews. The Spanish caliphate ended in 1492 as the Catholic Reconquista (reconquest) ousted the last Spanish Muslims and Jews from Spain. The Syrian Umayyads lost their rule to a newly rising Muslim family, the Abbasids, their original rivals in Mecca.

The Abbasid caliphate (749/750–1258) ruled from its celebrated capital of Baghdad, Iraq. Its rule spread Islam into Persia (Iran), Central Asia, Afghanistan, and northwestern India. The Abbasids were known chiefly for intellectual, artistic, and scientific achievements. They were great patrons of scholarly research, most of which was the first of its kind in world history. Caliph al-Mamun (ruled 813–833) was one of the most distinguished Abbasid caliphs. From different parts of the region al-Mamun brought together scientists when he built Bait al-Hikma (House of Wisdom) in Baghdad. There Muhammad bin Musa al-Khwarizmi (780–850) produced the new sciences of algebra and algorithm. In the scientific and liberal culture of Baghdad, new areas were covered in astronomy, geography, philosophy, mathematics, natural sciences, anatomy, and medicine.

Under the Abbasids Muslim scholars and scientists translated into Arabic ancient Greek masterpieces of philosophy, arts, and sciences. These Arabic translations were further translated into the vernaculars of Europe, where this body of knowledge led to the rise of the Renaissance and rationalist thinking. Some Arab scholars dedicated their works to the Abbasid caliph al-Mamun, who had provided them with the best of libraries in world history.

Arab League

The Arab League is an organization of twenty-two countries whose purpose is to develop educational and economic policies and programs to benefit the Arab world. Although the Arab League was organized in 1945, its roots go back to the early 1900s. But a lack of unity and cooperation among its members has hindered the Arab League's success, and whether the league will be effective in the future remains questionable.

During the early 1900s most Arab countries were still under colonialism, but a growing number of Arab political leaders, especially those from Syria and Egypt, wanted more of a role in shaping the future of their countries. By 1932 leaders had made plans for the Pan-Arabian Conference, the purpose of which (according to a 1932 *New York Times* article) was to "combat imperialism and to free Arabian States from mandatory control." Calls for Arab unity increased, led by Egyptian diplomat Abdul Rahman Azzam and Iraqi prime minister Nuri Sa'id, who is credited by some historians with coining the name "Arab League." By 1944, at a conference in Alexandria, Egypt, the framework for the league was created, and on 22 March 1945, the official charter was signed. The Arab League's constitution declared that one of the Arab League's goals is "to promote cooperation among member states, particularly in matters of culture, trade, and communication" (*New York Times* 1945, 8). Seven countries were the founding members: Egypt, Jordan (then called "Trans-Jordan"), Saudi Arabia, Syria, Iraq, Lebanon, and Yemen. The league's first secretary-general was Abdul Rahman Azzam, whose previous experience included serving

as Egypt's minister of Arab affairs and undersecretary of foreign affairs. A strong proponent of Arab nationalism, Azzam would become the Arab League's liaison with Western governments as well as the league's spokesperson at the United Nations.

During its first year the league advocated for greater autonomy for those Arab countries still under colonial rule or occupied by foreign troops. The league expressed support for Libya (which had been under Italian rule until World War II), and it also spoke out on behalf of Syria, which, although an independent republic since 1941, still had French troops on its soil. The Arab League also wanted a solution to the problem of Palestine; members were opposed to further Jewish immigration into the region. They joined to mount an attack against the newly created state of Israel in 1948, but the attack was unsuccessful.

During the league's early years it did not have much actual power, but it was able to speak with a unified voice on issues that mattered to the Arab world. Secretary-General Azzam became well known for his diplomatic efforts at the United Nations; he served as secretary-general until he resigned in 1952. After Libya finally gained independence, it joined the Arab League in 1953. Next to join were Sudan in 1956, Tunisia and Morocco in 1958, and Kuwait in 1961. Other members include Algeria, Bahrain, Comoros, Djibouti, Mauritania, Oman, Qatar, Somalia, and the United Arab Emirates.

Lack of Unity

Although the idea of the Arab League showed promise, the organization's effectiveness has been hampered by members who at times refuse to work

together. Political divisions have often made consensus impossible. Since its inception the Arab League has acquired a reputation for inaction in the face of crisis. The Egyptian weekly newspaper *Al Ahram* observed in a 2002 retrospective that the Arab League had not been notable for success in handling inter-Arab disputes.

When problems arose in the Arab world, the league tended to react with anger or blame. For example, when Egypt's president, Anwar Sadat, decided to make a peace treaty with Israel during the late 1970s, the league members united and expelled Egypt from membership, moving meetings that had been held in Cairo to Tunis, Tunisia. A decade would pass before Egypt was reinstated. In addition to ongoing antipathy toward Israel (and the perception that U.S. foreign policy unjustly favors Israel), other issues led to feuds between member countries. During the late 1980s the league was unable to resolve a dispute over oil between Iraq and Kuwait. This dispute led Iraq's Saddam Hussein to order the invasion of Kuwait. The United States intervened, driving Iraq out of Kuwait during the first Gulf War.

U.N. Report

Although the Arab League has at times been an important voice for improvements in the Arab world, a United Nations report issued in 2002 showed how much needs to be done. Prepared by fifty Arab scholars, the report examined political, economic, and cultural problems in Arab countries and concluded that these countries were lagging behind other parts of the world. "Arab countries are the least free in terms of political participation, civil liberties and independent media," the report stated and also took Arab countries to task for their treatment of women. "More than half of Arab women are illiterate, and many suffer from legal and social discrimination. They also have the lowest levels of political participation; women have 3.5 percent of seats in Arab legislative bodies, compared with 11 percent in sub-Saharan Africa . . . [and] despite substantial investment in education, Arab schools are producing graduates ill-

suited to the global economy. Only 0.6 percent of Arabs use the Internet, compared with 54 percent of Americans" (*USA Today* 2002, 6A). And while several Arab nations, notably Dubai and Qatar, have embraced modernity and welcomed certain aspects of globalization, the majority of the member countries continue to have internal conflicts, usually between conservative forces that want theocratic rule and moderate forces that want some degree of secularization.

The rise of Islamic fundamentalism and the violent actions of the terrorist network al-Qaeda have intensified the divisions between moderate Muslims and those from more conservative countries. Whereas the league has issued policy papers that condemn terrorism, some member countries have actively supported it. And even when a Muslim despot mistreats his people, the Arab League still seems reticent to criticize a member country. Since 2002 members of the league have made a renewed effort to unite and develop new strategies, brought about by world events such as the U.S. invasion of Iraq, but the May 2004 summit, held in Tunis, showed that the league still has a long way to go: one leader walked out, and eight others didn't attend at all. Although a series of position papers emerged from the summit, including one that pledged to implement economic and social reforms and work toward peace in the Middle East, questions remained about how much would actually be implemented.

In 2007, several moderate Arab states tried to move the Arab League towards diplomatic solutions in the Middle East. The foreign ministers of Egypt and Jordan met with Israeli leaders in Jerusalem to discuss peace proposals, but although the meeting was historic, the subsequent reaction from many of the Arab League's member nations was not as positive. A majority still refuse to recognize Israel or engage in any talks, thus limiting what Egypt and Jordan could accomplish.

The Arab League has other unresolved issues, in addition to its relationship with Israel. Political disputes have persisted between Hamas and Fatah in the Palestinian Territories, and there has been civil unrest in countries like Lebanon, Iraq, and Sudan. It remains

My Palestinian intellectual friend tells me that he might be willing to admit that God in Hebrew said Jews could have Israel. But he said Allah did not speak it in Arabic to the Arabs. • **Arthur Hertzberg (1921–2006)**

to be seen what role, if any, the Arab League can play in solving the problems its member nations still face.

Archaeology

Archaeology, one of the four divisions of anthropology, studies artifacts left by past cultures in order to understand how groups and societies developed. Attempts at archaeology were made as long ago as the sixth century BCE, but the practice grew into a science during the late nineteenth century and has continued to evolve more holistically, seeking to explore past civilizations through ecology, environment, and culture.

Archaeology is a part of the anthropological four-field approach to studying past and present cultures. The biological, linguistic, sociocultural, and archaeological divisions of anthropology work together to research societies through areas such as diet, language, social structures, and kinships. Archaeology in particular attempts to understand, describe, and explain the construction and development of past cultures through the study of their material remains. In order to do this, archaeologists often incorporate interdisciplinary methodologies from other fields, as well as develop techniques to explore the numerous questions archaeological data may present.

It appears that people have always had an interest in groups that lived before them. Typically, most want to understand how previous cultures interpreted the world around them. For instance, during Egypt's eighteenth dynasty (1532–1305 BCE), a number of scribes wanted to know more about how those that lived before them constructed tombs, how people were interred, and how they interpreted the afterlife. To answer these questions they examined burials dating from centuries earlier and left graffiti to record their visits. During the sixth century BCE Nabonidus, a prominent king of the famous Babylonian empire,

The Temple of Warriors at Chichén Itzá, Mexico, an archeological site rich in material artifacts of the Maya culture (ninth–thirteenth centuries). Photo by Chris Howell.

demonstrated his interest in the past by excavating at the city of Ur. He desired to know more about ancient Sumerian culture, a civilization then already 2,500 years old. Interestingly, the Babylonian king shared many of his finds with others by exhibiting them. His daughter, Bel-Shalti Nannar, continued her father's archaeological work following his death.

Archaeology has continued to play a part in how people investigate past cultures, but the discipline has undergone considerable developments. During the fifteenth century CE, for example, Cyriacus of Ancona, an Italian merchant, traveled the Mediterranean coast and Greece, drawing and gathering information about ancient monuments, copying inscriptions, and collecting objects from early civilizations. Because Cyriacus attempted to study ancient writings and material culture, some consider him to be one of the first archaeologists. Moreover, scholars began to challenge religious traditions through archaeology. For

instance, in 1655, Isaac de la Peyrere argued that stone tools found in Europe came from a culture that existed before the biblical Adam. The development of Assyriology and Egyptology during the nineteenth century CE also contributed to how scholars studied the civilizations of Assyria, Egypt, and others. Jean Francois Champollion's deciphering of the Rosetta stone in 1822 was a huge breakthrough in understanding ancient Egyptian languages and dialects.

Also during the nineteenth century, scholars and laypersons from Europe and other countries around the world sought to explore past civilizations through the study of material culture. Although most had sincere motives, some of the approaches to excavating were essentially treasure hunting. However, the growing study of evolution during this period influenced archaeology profoundly. Many scholars now began to investigate the origin and development of peoples and their cultures; digging at sites became more systematic. In the latter nineteenth century and into the twentieth, archaeologists began to focus on chronology, established the successive "three-age scheme" of stone, bronze, and iron, and searched more intensely for the beginnings of humankind. Anthropologists Charles Darwin (1809–1882), Lewis Henry Morgan, Edward B. Tylor, and others contributed greatly to this new direction. Although chronologies, the three-age scheme, and the quest for human origins would undergo numerous debates and controversies, the discipline of archaeology benefited and adopted more scientific approaches. Some significant contributions to the discipline must be credited to scholars such as Heinrich Schliemann (Troy), Flinders Petrie (the Near East), Leonard Woolley (Carchemish), Aurel Stein (Asia), Mortimer Wheeler (Britain), the Leakeys (Africa), and W. F. Albright (Israel/Palestine).

The 1960s and 1970s "New Archaeology," sometimes referred to as analytical or processual archaeology, brought a revolution to the field that is reflected in some fashion in the work of many archaeologists to this day. Lewis Binford, Fred Plog, William Longacre, and others took a more anthropological approach and sought to explore past civilizations holistically through ecology, environment, and culture. This

Detailed drawings of an excavated site are important tools in archaeological research. Here, a nineteenth-century sketch of the ruins of a church on Mt. Gerizim in Palestine.

"new" approach and philosophy has placed a permanent stamp on field and laboratory methodologies. Consequently, archaeological teams have grown to incorporate a blend of staff personnel that may include paleoethnozoologists, geologists, climatologists, and anatomists. Processual archaeology has also generated post-processual archaeology. This approach is similar to the New Archaeology, but also focuses on the inclusion of history and tries to interpret meaning in artifacts. Ian Hodder, Mark Leone, and others have contributed to the development of this methodology.

Architecture

In the practice of architecture, the art and science of building environments for human needs, architects strive to design structures that are sound, useful to their inhabitants, and aesthetically pleasing to society—whether starkly monumental in structure (like ancient Stonehenge and the modern skyscraper) or elaborately embellished (like the Parthenon in Greece and Córdoba’s Great Mosque).

Since prehistoric times, people have created architecture to shelter their activities and to express societal or personal values. Usually the term *architecture* refers to a building or group of buildings, but the field overlaps with interior design and with landscape and urban design. Many architects agree with the ancient Roman architect Vitruvius (c. 90–c. 20 BCE), who wrote that architecture must be stable, useful, and beautiful. To accomplish this architects must understand (a) how to employ one or more structural systems to support the design, (b) how the design will be used once it is built, and (c) what a client or society will find visually pleasing. Therefore, architects are faced with choices regarding approaches to the building site, available materials, and building technologies.

Prehistoric and Nonurban Architecture

Nomadic humans of the foraging (Paleolithic) era (c. 35,000–8000 BCE) lived in caves and rock shelters, but they also created portable woven architecture—oval huts of vertical poles that were covered with hides or thatched reeds. In the Neolithic era (c. 8000–1500 BCE),

herders and farmers erected permanent settlements, including monumental buildings that merged with surrounding landscapes. They crudely quarried large stones (megaliths), moved them by barge and by sled on rollers, and raised them on earthen ramps to create

Stonehenge, the best-known monument of the Neolithic era, dramatically illustrates the concept of **trabeated architecture**—construction based on a post-and-lintel system. Photo by Carol Hermann.

trabeated (or post-and-lintel) structures (dolmens) of vertical columns supporting horizontal beams. The most famous example of such a structure, located on Salisbury Plain, England, is Stonehenge (c. 2750–1500 BCE), a series of concentric circles probably built to accommodate festivals held by related warrior tribes. The more common dolmen was a sepulchral chamber built of megaliths and buried within an artificial hill, called a cairn.

Little remains of more humble buildings, except their influence on the surviving vernacular architecture of villages around the world, rooted in the myths and traditions of the people. In African Cameroon each Bamileke village has a central open space, chosen as sacred by the ancestors. The adjacent chief's house, an aggrandized version of the others in the village, has bamboo walls fronted by a porch and sheltered by a thatched conical roof. In Cameroon's Fali culture, forms, orientation, and dimensions of the ideal human body inspire the design of residential compounds. The Dogon culture of Mali builds men's assembly houses, open-sided huts in which anthropomorphic wooden pillars, representing the ancestors, support a thick roof of dried vegetation that shades the interior but allows air to circulate.

A similar situation is found in North America, where the Anasazi people constructed "Great Houses," of which Pueblo Bonito in Chaco Canyon, New Mexico, is the largest known. Built in stages from the tenth to the mid-thirteenth century CE, the quarrying, timber cutting, and transport during the construction were done without metal tools, wheelbarrows, or draft animals. In its final form Pueblo Bonito resembled a "D" with a perimeter wall approximately 400 meters (about 1,300 feet) long. Sandstone walls defined adjacent living units accessed from openings in the wooden roofs. Hundreds of units encircled central plazas under which the Anasazi built subterranean sacred gathering places (kivas). Men entered a kiva—women were forbidden—through a hole in a domed ceiling of interlocking pine logs. Because the number of rooms at Pueblo Bonito far exceeds evidence of human habitation, and the desert locale made obtaining food a constant challenge, archaeologists believe that the Anasazi devoted many of the rooms to food storage. When threatened by

enemies, the Anasazi abandoned the Great Houses for dwellings built into the sides of easily defensible, south-facing cliffs, such as those at Mesa Verde, Colorado (twelfth–thirteenth centuries CE).

Ancient Temple Ziggurats, Tombs, and Palaces

Urban civilization—dependent on the development of writing, trade, diversified employment, and a centralized government—produced a variety of monumental building types, generally to glorify gods and god-kings. In the first cities of Mesopotamia, temples were raised heavenward on giant stepped platforms called ziggurats. Both temple and ziggurat were built of sun-dried mud brick using bearing-wall construction. The Ziggurat of Ur-Nammu (c. 2100 BCE) in Ur, Iraq, was faced in a more durable kiln-dried brick laid in a bitumen mortar. In Central America the stepped pyramids of the grand city of Teotihuacán (c. 250 BCE–650 CE), near present-day Mexico City, were faced with volcanic stone and stucco and probably painted bright colors. They formed the backdrop for the rituals and public events associated with the temples, which took place on the top platforms.

Of the monumental tombs, the most famous are the three Great Pyramids of Giza (c. 2551–2490 BCE) in Egypt, which exhibited ashlar masonry (carefully cut stone blocks), piled in tight rows and faced in polished limestone. Workers probably used wooden rollers and sleds on earthen ramps to elevate the heavy stone blocks, and levers to place them in their final locations. These tombs memorialized god-kings for eternity and were seen as ladders for royal spirits to reach the heavens. In Greece beehive-shaped tombs survive, such as the Treasury of Atreus (c. 1300–1200 BCE) at Mycenae, where a vault of corbelled stone (formed by laying each course of stone slightly inward and beyond the previous row until it forms a narrow arch) capped the subterranean main circular chamber. The tomb, half buried until excavated in 1878, remained the largest uninterrupted interior space in Europe for over a thousand years, until the Pantheon in Rome (built in the first century CE), exceeded it in size.

A third type of monument served rulers during their lives. The enormous Assyrian Palace of King Sargon II (c. 720–705 BCE) at Dur Sharrukin, modern Khorsabad, Iraq, represented his combined secular and sacred authority and intimidated his foes with the carved imaginary beasts and scenes of military prowess that decorated its mud-brick walls.

The Greek Temple

The ancient Greeks influenced later Western builders with their post-and-lintel building tradition. Their three types of orders—systems of columns supporting entablatures—were distinguished by proportion and decoration, Doric being the most simple, Ionic more elegant in proportion than the Doric, and the Corinthian the most elaborate. Stone blocks of limestone and marble were held in place by metal clamps and dowels, and terracotta tiles covered the sloping wooden roof rafters. The apex of Greek architecture, the Parthenon temple (448–32 BCE), designed by Kallikrates, redesigned by Iktinos, with construction supervised by the sculptor Pheidias, was meant to be the focal point of Athens's raised sacred precinct, the Acropolis. The Parthenon featured a

stepped platform and an exterior row of columns (or colonnade) that sheltered a central room housing a gigantic statue of Athena. The temple's proportions, determined by harmonious numerical ratios, were given life by the slight curvature of lines (called entasis), so components appeared to resist the weight imposed on them from above. (The entire temple was marble, even the roof.) Surfaces were stuccoed, painted, and embellished with colorful relief sculpture and friezes much admired for their graceful naturalism.

Roman Innovations and Their Eastern Progeny

Ancient Roman buildings, complexes, and new towns were regimented by simple geometric spaces related along clear axes and were often constructed using new materials and technologies. Voluminous interiors were created by using the semicircular arch, a method of spanning space with many small wedge-shaped elements that balanced against one another. Three-dimensional extrusions of the arch formed tunnels, rings, domes, and other types of spaces. The Romans employed concrete—a mixture of cement, water, and aggregate that can take on many

The architects who designed the Parthenon as the focal point of the Athenian Acropolis perfected an anthropometric approach to design, including its proportioning system and subtle optical refinements. Photo by David M. Breiner.

flowing shapes—and faced it in stone or coursed brick and tile. The best-known examples of Roman architecture, the Pantheon temple (117–126 CE) and the Colosseum amphitheater (c. 70–80 CE), both in Rome, had interiors that were spatially exciting, their concrete surfaces lavishly finished with multicolored marbles, gilding, and sculpted detailing. The Pantheon, the result of sophisticated engineering despite its apparently simple dome shape, is one of the most remarkable structures existing in Rome today; from the inside the eye is drawn by a circular pattern of coffers (recessed panels) toward the ceiling (about 43 meters, or 143 feet, high at the summit), where light flows through a 9-meter- (29-foot)-wide oculus (central opening).

During the waning years of the Roman Empire in Western Europe, Christians adopted the multipurpose basilica as the model for their churches, such as Old Saint Peter's (begun c. 320 CE) in Rome. This multi-aisled building featured parallel stone colonnades that supported the masonry walls above. Those in turn held up a roof structure of wooden trusses, rigid triangular frames that resulted in the typical gabled roof form. The glittering, glass mosaic surfaces of the interior were hidden by a bare brick exterior. Byzantine Christians in the eastern half of the empire chose Roman vaulted structures as their models, resulting in the Cathedral of Constantinople, Hagia Sophia (532–537 CE), by Anthemios of Tralles and Isidorus of Miletus. The enormous masonry dome, though it rested on four curved triangular surfaces (called pendentives) seemed to float unsupported above the interior, thanks to the ring of windows at the base of the dome and the light-reflecting surfaces of mosaic and marble throughout the vast interior. Also inspired by Rome, Islamic builders developed a new building type for communal worship, the mosque. The Great Mosque (eighth–tenth centuries CE) in Córdoba, Spain, exhibited the horseshoe-shaped arches of alternating stone and brick bands that became typically Islamic, while innovatively stacking the arches in two levels, thereby creating a limitless sense of space. Dazzling marble and mosaic decoration was limited to stylized vegetation and other nonrepresentational patterns, according to Muslim practice.

Beyond Rome's orbit, in the Buddhist monastery at Sanchi in India, the dome of the Great Stupa (first century BCE–first century CE) enshrined important relics. (Stupas, religious structures fundamental to the Buddhist world, were first constructed to house the cremated remains of the Buddha after his death in 483 BCE.) Protected within a wall featuring four elaborate gateways, the earth-and-rubble-filled dome of the Great Stupa represented the mountain of the world. Pilgrim worshippers circumambulated the building on walkways at two levels, reflecting the Buddhist belief in cyclical Earthly suffering that was only relieved upon reaching nirvana.

The Middle Ages

In the centuries after the Roman Empire, European Christians supported powerful monasteries, whose builders turned to bearing-wall construction in limestone, granite, and sandstone. Master builders maintained the basilican church form (a rectangular building with side aisles separated from the center nave by colonnades), but ultimately they replaced the simple plan and trussed roof with more complex solutions to the problems presented by increasing numbers of pilgrims and concerns over fire safety. During the Romanesque Era (c. 1050–1200), so called due to the revival of Roman (that is, semicircular) vaulting techniques, builders experimented with heavy stone-vaulted ceilings and extended side aisles around the church's perimeter to improve circulation for pilgrims. Extensive sculpted ornament in abstracted forms greeted visitors with Christian lessons of good versus evil. The French church of Saint-Sernin (c. 1070–1120) in Toulouse exemplified this movement.

Structural experiments coalesced in the later twelfth century and throughout the thirteenth, during the Gothic era, led by northern France, which dominated Europe at that time. Gothic verticality, aspiring to express divine loftiness, combined with great visual coherence at Chartres Cathedral (1194–1220), where the minimal stone skeleton supported walls of stained glass illustrating sacred and secular themes. This effect was made possible through the

combined use of the structurally efficient pointed arch, the framework of arched ribs (rib vaults) that allowed lighter vault panels, and the flying buttress that supported the vaults outside the building. Broad and steep roofs of innovative wood truss design protected the church vaults. A very high level of roofing technology was also evident in the contemporary wooden stave churches (using post-and-beam construction) of Norway.

Around the same time, builders in south and east Asia likewise developed impressively tall structures to house images of their gods and to visually connect Earth with heaven. Hindu Indians created the Visvanatha Temple to Siva (c. 1000) at Khajuraho, in the state of Madhya Pradesh. Inspired in design by a mandala (cosmic diagram), the temple's "grid plan" featured a sequence of increasingly important spaces, concluding at the inner sanctum with its image of Siva. Seemingly countless voluptuous sculptures covered the exterior surfaces that climaxed at the mountain-like tower over the inner sanctum. In China and Japan, Buddhist pagodas served similar uses but were characterized by their winged eaves and centralized plans.

In Europe continued insecurity encouraged the powerful to live in fortified castles. A moat and high walls with towers protected inner courts and the main

multistoried residence, called a keep or donjon (the word *dungeon* is a derivative). By the latter Middle Ages, improved security fostered the development of the less-fortified, but still grand, manor house; the main room, or great hall, a multifunctional entertainment space, required sturdy roof support in the form of various trussed solutions. The Islamic rulers of Spain produced luxurious, sprawling palace complexes, such as the Alhambra (thirteenth–fourteenth centuries) in Granada. The gardens interspersed throughout the complex provided refreshing water, fragrant plants, and soft, indirect lighting. Rooms had ethereal domes, whose structure was veiled by *muqarnas*, open, honeycomb-like cells made from stucco or wood.

Idealized Plans and the Renaissance

Beginning in the fifteenth-century Italian Renaissance, men with humanistic educations, not just practical building experience, aided by familiarity with classical antiquity, mathematics, and orthogonal drawing, won many architectural commissions. Their buildings and publications argued for the unity of architectural practice and theory. Filippo Brunelleschi's Cupola (1417–1434), or dome and lantern, for the Cathedral of Florence combined a Gothic pointed profile and a

The Villa Rotonda (or Villa Capra) merges religious and domestic symbols. Its domed central hall and four matching porticoes dominate the bucolic site and make it among the most memorable achievements of the Italian Renaissance. Photo by David M. Breiner.

Pantheon-like concentric grid with his original ideas of a double shell, interlocking brick pattern, and inventive construction mechanisms. Sophisticated uses of Roman ideas also characterized the work of Leon Battista Alberti, whose classically grand Church of Sant'Andrea (begun c. 1470) in Mantua, Italy, derived from ancient building types, proportional systems, and the classical orders. Its façade—a classical temple front and triumphal arch, with two sets of Corinthian pilasters on the porch—belies the grand interior: an immense barrel-vaulted nave flanked by tall chapels.

Efforts to supersede classical accomplishments were evident in the contemporary architecture of Rome. The first grand scheme by Donato Bramante (1505) for rebuilding the Basilica of St. Peter affirmed the humanist interest in the idealized centralized church plan. Under Michelangelo's guidance the design of the basilica's cupola (1546–1564) was largely resolved, producing a cohesive and influential scheme that was the last of the great purely masonry domes. Michelangelo also designed a monumental civic center, the Campidoglio (begun 1538), its complexity organized by a strong central axis, colossal pilasters on the building facades, and the view over the city.

Renaissance ideas spread from Florence and Rome. Near Venice, Andrea Palladio, an experienced stonemason and a humanist scholar, advanced his own influential architectural treatise; by the eighteenth century most educated people (including Thomas Jefferson in America) had his *Four Books of Architecture* in their libraries. In his design for a suburban residence near Vicenza, Italy, the Villa Rotonda (begun 1566), he appropriated the portico (four, actually, one on each side of the square structure) and central domed hall formerly associated with religious buildings. The building is famous for its idealized siting, harmonic proportions, simple geometries, and clear axial relationships. Venice's powerful nemesis, the Ottoman Empire, produced Palladio's counterpart, the architect Sinan, whose skillful designs for central-domed mosques with stunning tile work were represented by his Mosque of Selim II (1568–1575) in Edirne, Turkey.

Idealized masonry monuments of the West contrasted with the idealized wooden post-and-lintel

structures of the East, climaxing in Ming dynasty (1368–1644) China. The focal point of Beijing's monumental Forbidden City was the emperor's principal throne room, the Hall of Supreme Harmony (begun 1627). Though grander in size and ornament than other Chinese halls, its arrangement of standardized interchangeable parts was similar. A grid of wooden columns supported fingerlike brackets, which in turn held boxlike truss beams (or stepped roof trusses) that produced the characteristic curve of the tiled roof. Japanese builders transformed the Chinese architectural system by favoring more subtle asymmetrical arrangements and indirect paths of circulation, from Sen no Rikyu's intentionally rustic Tai-an tearoom, Myoki-an Temple (c. 1582) to the impressive Imperial Katsura Palace (largely c. 1615–1663), both in Kyoto.

Baroque Vitality

In the seventeenth-century West, Renaissance priorities blended with the dynamic growth of science, nationalism, and religious fervor. Designs, often structurally and spatially complex and characterized by illusionistic effects, were best appreciated by a person moving through them, for example, Gianlorenzo Bernini's Piazza (1656–1667) at St. Peter's in Rome. Intense ornamentation was common during the period and spread to Spanish and Portuguese colonies in Latin America. The monumental enlargement of the Château at Versailles (1667–1710), for France's autocratic "Sun-King" Louis XIV, had a network of axial pathways that led to the king's central bedchamber. In the château's Hall of Mirrors, innovative large mirrors created infinitely reflecting vistas of the vast gardens. Christopher Wren, who was a scientist before becoming an architect, reworked continental influences in his redesign for St. Paul's Cathedral (1675–1711) in London, where the cupola combined an inner masonry shell with a lightweight outer dome and lantern. In Bavaria structural experimentation, illusionism, and spatial complexity climaxed in works such as the Residence of the Prince-Bishops (1719–1753) in Würzburg, by Johann Balthasar Neumann.

Historical Revivals

Eighteenth-century architectural influences included the Enlightenment, which emphasized the individual person; increased historical scholarship, especially archaeology; and the Industrial Revolution. Giambattista Piranesi's widely disseminated, imaginative views and reconstructions of ancient Roman ruins aroused awe. In England, Robert Adam's renovation of Syon House (1760–1769) in Middlesex sought to authentically re-create the architecture of classical Rome. Yet with Horace Walpole, Adam also created the mysterious, picturesquely asymmetrical Gothic Revival Strawberry Hill (1749–1763) at Twickenham, its different parts appearing to be centuries-old accretions. French architect Jacques-Germain Soufflot combined Gothic structural lightness with classical spatial purity in his Church of Ste.-Geneviève (1755–1780) in Paris. Étienne-Louis Boullée drew unbildable projects, like the Cenotaph to Isaac Newton (1783–1784), a classical but sublime giant hollow sphere that celebrated the achievements of the great physicist. It connected use and form in a direct manner called “architecture *parlante*.” The mining of historical

styles for contemporary projects continued into the nineteenth century, highlighted by Karl Friedrich Schinkel's Greek Revival Altes Museum (1824–1830) in Berlin, and the Gothic Revival Houses of Parliament (begun 1835) in London, by Charles Barry and A. W. N. Pugin.

By the mid-eighteenth century, Europeans began to seek increasingly private and comfortable residences. Renovated (1732–1739) in the delicate Rococo style by Germain Boffrand, the Hôtel de Soubise in Paris incorporated intimate interiors that were easily heated by improved fireplace design and easily illuminated by large windows and mirrors. Residences of the wealthy incorporated dumbwaiters and corridors to allow greater separation between masters and their servants. The English aristocracy and North American colonists also turned to making more comfortable buildings, typically favoring a restrained neo-Palladian approach to design, such as Thomas Jefferson's Monticello (1768–1782) in Charlottesville, Virginia.

Early Modernism

In the nineteenth century, the Industrial Revolution expanded its impact on European architecture. France's

Frank Lloyd Wright's Robie House adapts horizontal lines of the prairie into long brick planes, continuous window bands, and deep overhangs. Photo by David M. Breiner.

Architecture is the art of how to waste space. • Philip Johnson (1906–2005)

official architectural school, the École des Beaux-Arts, emphasized “universal” architectural ideals found in primarily classical models, but the buildings of its alumni, including Charles Garnier’s exuberant Opéra (1860–1875) and Henri Labrouste’s Bibliothèque Ste.-Geneviève (1838–1850), both in Paris, united those lessons with contemporary technology. The Eiffel Tower (1887–1889), by Gustave Eiffel, epitomized the celebration of modern materials and their logical assembly. Conversely, William Morris, the most significant British voice at the time, protested against the social upheaval and shoddy craftsmanship associated with the Industrial Revolution. His own home, The Red House (1859–1860) in Bexleyheath, Kent, designed by Philip Webb, exemplified his Arts and Crafts Movement with informal, vernacularly derived forms and materials that hearkened back to a simpler time.

American architects adapted these British ideas to their own context. Balloon-frame construction (pre-cut timber studs connected by machine-made nails), which was sheathed with wooden shingles, allowed more informal, open interior layouts that were easy to heat with American central heating systems and easy to cool during the hot American summers. The epitome of the American Shingle Style was the Mrs. M. F. Stoughton House (1882–1883) in Cambridge, Massachusetts, by Henry H. Richardson. Americans continued to take the lead in residential design with the work of Frank Lloyd Wright, whose inspiration came from nature, simple geometries, and exotic cultures. Wright’s F. C. Robie House (1908–1910) in Chicago climaxed his search for the “Prairie House.” The building’s strong horizontality and locally inspired ornament harmonized with the prairie of the Midwest. Abstracting Japanese and other prototypes, he created transitional zones that wove together exterior and interior space and effortlessly connected interior spaces around the central hearth.

Modernism

Seeking to express contemporary life and technology, modern architects increasingly relied on modern

The Seagram Building relies on a limited palette of exquisite materials arranged according to a strict three-dimensional grid, thereby demonstrating Mies van der Rohe’s maxim “less is more.” Photo by David M. Breiner.

materials, exposed structure, and undecorated compositions that were open and asymmetrical. Many designers searched for schemes that would be universally valid in a world made more homogeneous by technology. The results spanned from a machine-like precision to an organic expression of use and/or place.

Iron and steel structural frames increasingly transformed architecture beginning in the late nineteenth century. European Art Nouveau designers copied natural forms and exposed the sinuous iron structure in their glass-filled buildings, such as Victor Horta’s Tassel House (1892–1893) in Brussels,

Belgium. In American cities the demand for space, the need to cluster offices, and the desire to create bold symbols of business set the stage for modern skyscraper construction. Tall buildings depended on the passenger elevator and the development of metallic cage construction that was fireproofed, insulated, and ornamented in brick, stone, or terracotta. Louis Sullivan's Guaranty Building (1894–1895) in Buffalo, New York, exemplified early attempts to devise a visually coherent solution to a new building type. Ludwig Mies van der Rohe, the master of the steel and glass skyscraper, pared away visual clutter to express the purity and careful proportions of the steel skeletons, as exhibited in his Seagram Building (1954–1958) in New York City. Other building types were similarly transformed by metal construction, for example Kenzo Tange's steel tensile suspension design for the National Gymnasium (1961–1964) in Tokyo, Japan.

The rediscovery of concrete as a primary building material and the innovative addition of metal bars to create reinforced concrete structures expanded the scope of modern architecture. Le Corbusier (born Charles-Edouard Jeanneret) established his international reputation with machine-age designs like the pristine concrete box of the Villa Savoye (1928–1929), near Paris; and later he led the expressionistic Brutalist movement with the aggressive, roughly finished concrete forms of the Capitol Complex (1950–1965) in Chandigarh, India. The contours and textures of subsequent reinforced concrete buildings ranged from the soaring openness of Jørn Utzon's Opera House (1956–1973) in Sydney, Australia, to the contemplative enclosure of Tadao Ando's Koshino House (1979–1981) in Hyogo, Japan.

Over time architects increased their use of glass from the exterior "curtain" (non-load-bearing) walls of Walter Gropius's Bauhaus Building (1925–1926) in Dessau, Germany, to the strut- and mullion-free glazed exterior of Norman Foster's Willis Faber Dumas Office Building (1975) in Ipswich, United Kingdom.

Some highly successful twentieth-century architects gained respect by adapting modern, universal

themes to local conditions and cultures in their work. Among the most noteworthy were Alvar Aalto's Civic Center (1949–1952) in Säynätsalo, Finland; Louis Kahn's National Assembly Building (1962–1974) in Dacca, Bangladesh; and Renzo Piano's Jean-Marie Tjibaou Cultural Center (1991–1998) in Nouméa, New Caledonia.

Architecture Enters the Twenty-First Century

Contemporary architectural trends continue to respond to the issues of culture and technology. Like

An example of tensile architecture: the Elrey Jeppesen Terminal at Denver's International Airport uses steel cables and Teflon-coated fiberglass to create an airy interior, while the exterior mimics nearby peaks of the Rockies. Photo by David M. Breiner.

The Jean-Marie Tjibaou Cultural Center is an exemplar of contemporary hybrid solutions, combining diverse perspectives of design and the shell-like vernacular huts of local villages.

many leading architects, Rem Koolhaas has questioned societal beliefs and institutions in his Netherlands Dance Theater (1987), The Hague. Innovative solutions for structure and interior illumination aided the design of Norman Foster Associates giant Hong Kong Bank (1986) in Hong Kong, China. Tensile membrane structure, such as the Denver (Colorado) International Airport (1994) by C. W. Fentress, J. H. Bradburn & Associates, allows large spaces to be enclosed, while the curving structural steel columns of Beijing's National Stadium (the Bird's Nest)—designed for the 2008 Olympics by the Swiss firm Herzog & de Meuron in collaboration with Chinese artist and architect Ai Weiwei—weave a permeable outer layer that can be crossed or even climbed, allowing people to feel absorbed rather than smothered by the enormous structure. Digitized imaging software facilitated the titanium-clad design of Frank Gehry's Guggenheim Museum (1997) in Bilbao, Spain.

In the growing trend of “green” or ecologically sustainable design, designers conserve materials and energy, provide occupants with abundant fresh air and

natural light, and carefully manage waste. Among the best-known examples is William McDonough & Associates Offices for Gap, Inc. (1997) in San Bruno, California, with its careful siting, vegetated roof, and other “green” elements. Kenneth Yeang's Menara Mesiniaga Building (1991) in Kuala Lumpur, Malaysia, connects sustainable design with the local traditions of Southeast Asia.

A third trend is the revival in vernacular traditions that has been building since at least Hassan Fathy's design for the Village of New Gourni (1945–1948) at Luxor, Egypt. In the United States vernacularism has inspired the pedestrian-friendly “new urbanism” movement publicized by the design of Seaside, Florida (begun 1981), by Andres Duany and Elizabeth Plater-Zyberk.

Architecture, Vernacular

The term *vernacular architecture* applies to structures built based on local traditions and skills passed down through generations, not on the designs of professional architects. Building techniques vary widely depending on function, location, and available materials. Although historians and educators have largely overlooked vernacular architecture, its practice today continues to shape most of the world's built environment.

Vernacular architecture is the term now internationally applied to buildings that are constructed according to indigenous traditions rather than a professional design. Most of the world's buildings fall into this category; people of innumerable cultures have built structures to meet their physical, social, economic, and spiritual needs. Because many cultures have not been literate, or literacy has been confined to the elites, vernacular traditions have often remained unrecorded and their history is difficult to ascertain. Archaeological excavations have frequently concentrated on religious, palatial, and military sites, but at Sumer for example, the ancient Mesopotamian region of southern Iraq, archaeologists have uncovered dwellings dating back to the fifth millennium BCE, revealing plans, structures, and spatial organization that are similar to settlements extant today.

Certain examples of early art, such as tomb paintings of Middle Egypt or Roman mosaics in Carthage, on the gulf of Tunis, depict the materials indigenous peoples used in their buildings, including reed thatch, earthen bricks, and clay tiles. Ancient artifacts may also illustrate vernacular building styles; a third-century-CE bronze mirror from Nara, Japan, bears

images of house and granary types that are still built in Southeast Asia. Clay models of houses placed in graves in Greece, Mesopotamia, and China, some including figurines, show their structure and indicate how they were used. While unbroken sequences of the history of buildings have sometimes been hard to establish, dendrochronology (tree-ring dating) and carbon dating have been applied in European vernacular studies to give a record spanning two millennia. In some countries, wills, inventories, and other documents have disclosed details that relate to property. Inevitably however, the history of vernacular building in much of the world is undocumented, and there is much room for research in the field.

Built to Meet Needs

Building traditions differ widely across the globe, but some requirements are common, mainly the provision of shelter for families. It is not known how many dwellings currently exist in the world; estimates range between 800 million and 1 billion to accommodate the 2009 population of more than 6 billion people. Of these, over three-fourths are vernacular, built by the owners or by skilled members of their communities, whose traditions in building have been passed from generation to generation.

Caves may have provided the earliest dwellings; evidence of cave occupancy in Spain and France dates from Paleolithic times. (In 2009, some 50 million people live in caves, particularly in China, but also in Europe, North Africa, and the Middle East.) Other peoples who hunted game and gathered fruits lived in the forests where they made temporary shelters of branches and leaves, as the Orang Asli of Malaysia

or the East African Hadza still do. Adapting to local conditions, peoples such as the Evenki of Siberia made their huts of wood from the taiga, or in the case of the seal-hunting Inuit of northern Canada, built domes of snow blocks.

Traveling in more arid regions, many tribes camped under tents made from strips of woven goat's hair; such "black tents" are still used by the Bedouin of Arabia. Desert nomads move with flocks of camels or goats, often by prearranged routes so that the sparse vegetation is not overgrazed and may recover. In more fertile regions such as the grasslands of Central Asia, the Kyrgyz and Mongols live in the yurt or *ger*, a dome raised on a cylinder of lattices covered with large felts that are tied in place. After a stay of weeks they dismantle the domes and move to new pastures where the women, who make all the components, rapidly re-erect them. As the examples of nomads indicate, the kind of dwelling used by a culture is partly conditioned by the economy in which its makers subsist.

Mankind cannot survive without water, and many cultures live close to rivers, often in the valleys or near the sea. Fishing peoples may construct dwellings on stilts or piles over the water, enabling them to protect their fishing grounds. Some, like sea nomads of the Philippines, live on boats as much as on land. The majority of vernacular buildings, however, are built by sedentary peoples who live in one place and who may be engaged in agriculture, livestock-raising, and the marketing of produce, or in craft occupations such as pottery or weaving, that meet material needs.

Although some vernacular buildings, including farmhouses, are found in relative isolation, most are located in hamlets and villages or in small towns and urban neighborhoods. They may house nuclear families of parents and children, common in North America or Western Europe. In much of the world, however, extended families of three generations, or the spouses and children of siblings, all live together. Suitably large houses may be built for them, as in

Nomadic tribes in fertile regions live in dwellings such as yurts, with easy-to-assemble components that allow for quick moves to new pastures.

Kashmir or western Anatolia, or several single-cell huts may be enclosed in compounds, as is common in West Africa.

Within the farmyard or compound, economic functions are accommodated in special structures. Among the most frequent are granaries, raised above ground to repel damp and rodents. Stables for horses and barns for draft animals or for wintering cattle are customary, though recently many have been adapted to take mechanical equipment. Among vernacular buildings that functioned until the early twentieth century were blacksmith's workshops and outdoor baking ovens, while watermills and windmills were widely used in Europe to provide the power for grinding corn or pigments, draining wetlands, and sawing timber. Many of these functional buildings were lost with industrialization, but others, such as potteries and carpenters' workshops, continue to be productive in many parts of the world.

Numerous vernacular buildings are constructed for social functions that relate to status, power, or belief. A special residence may be constructed by some cultures in honor of a chief, a prince, or a spiritual leader, perhaps as a larger version of the customary dwelling. In some instances, such as the Dyak peoples of Borneo or the indigenous forest cultures of western Amazonia, whole villages are accommodated in single buildings, usually called longhouses, in which all the families occupy spaces beneath one roof. Often the families belong to one clan, and the spaces may be arranged in hierarchical order.

Some buildings may have a ceremonial function, and in settlements the world over prominence is given to buildings that relate to religious beliefs. Temples, mosques, and churches house worshippers, while shrines protect votive objects or mark sacred sites. Priests from such religions may officiate at the selection of a site, bless the stages in the building of a house, and preside at a ceremony to mark its completion. Often the dwelling is itself symbolic, being perceived as having cosmic or anthropomorphic associations, as is the case in Hindu tradition. This serves the important function of reaffirming for the occupants the spiritual values of the culture to which they belong.

The great variety in the size, forms, and construction of houses and related buildings throughout the world is largely due to the diverse nature of specific cultures. Some require communal rooms in which whole families live together, while others have separate entrances to distinct living areas for males and females. The differences are also attributable to respective economies: Chinese hill farmers require accommodation for their livestock and their families, and the structures they build are quite different from the narrow frontages of shophouses—usually two stories high, and built in rows connected by deep courtyards—that are typical of Chinese urban neighborhoods. But whatever the culture and its people's needs, buildings are strongly conditioned by the environments in which they are situated.

Responding to the Environment

Vernacular buildings reflect the peculiarities of their locations, from grassland steppes, deserts, and plains to forests, valleys, lakesides, or mountains. Where land is freely available compounds may spread, but where sites are constricted houses of two or three stories may be constructed, some having stepped levels where gradients are steep. While the majority of circular-plan buildings have a conical roof of poles converging at the apex, the roofs of rectangular and square-plan buildings are pitched to a central ridge. With modifications in plan, such as a T, an L, a square, or a rectangle defining a courtyard, the majority of pitched-roof vernacular buildings take forms that are found with many variants worldwide. In tropical Sumatra (in Southeast Asia), for example, upswept roof ridges on the houses of the Minangkabau end in finials or small spires (a symbol of the horns of the sacred water buffalo). These roofs are effective in expelling warm air and keeping the interiors cool.

Climate is an important environmental factor in the design of vernacular buildings, but extremes of climate and natural hazards can do structural damage, with high winds lifting off roof cladding in the Caribbean and flood waters reducing clay walls in

Houses are built to live in, not to look on; therefore, let use be preferred before uniformity, except where both may be had. • Francis Bacon (1561–1626)

Bangladesh. Volcanic eruptions threaten Central America and earthquakes reduce literally thousands of buildings to rubble in Turkey and other seismic regions, though frequently it is the vernacular buildings rather than the concrete ones that enable people to survive a major disaster. In Kashmir and Peru, technologies have been developed that permit buildings to be flexible in earthquakes, but as natural disasters are unpredictable and may not recur, the main concern of most builders is to cope with the vagaries of the seasons and the weather.

In humid tropical climates, houses are constructed so as to encourage air circulation, while those in arid climates may be sited to reduce exposure to the sun; buildings placed around courtyards, for instance, offer continual shade during the day. In temperate and cold regions thick earth walls retain solar heat and warm the interiors; deep layers of insulating thatch are also used. Passive cooling devices such as wind scoops are used in the Middle East, while radiant stoves keep houses warm in the extreme winters of Central Europe. By such means builders have been able to create comfortable internal conditions. Even so, they are dependent on the material resources available to them, and these also exert their influence on the forms of the building.

Perhaps the most widely used material in vernacular building is earth. Whether it is molded to shape, rammed between wooden planked molds, mixed with straw and compressed in adobe blocks, or fired in kilns and made into bricks, earth is ubiquitous and employed in every continent. Factors such as particle size affect its suitability but in some regions, such as Yemen or southern Morocco, multistoried buildings of rammed earth have lasted centuries and are still being constructed. Clay is also used in combination with interwoven panels of willow or hazel wood in the technique, common in Britain, known as wattle-and-daub. Although techniques of molded mud can be used to make vaults, flat roofs on clay buildings are usually constructed with log poles, such as in the pueblos of the southwestern United States. In regions such as Tunisia or Egypt, where there is little wood, palm trunks are used.

Stone is strong and suitable for constructing walls when pieces of manageable size can be found, but it is less widely employed than clay. Time-consuming to quarry and heavy to transport, stone has been principally used in elite architecture rather than in the vernacular. Brick is an economic alternative to stone, with standardized sizes and techniques for laying courses, and the use of mortar to ensure stability. Brick building came to England from the Netherlands, and later the British introduced the technique to Africa. Brick and tile traditions were developed independently in China, where the weight of roofs was often borne by internal wood frames rather than by brick walls.

Although a material may be accessible another may take preference over it for economic reasons, or on account of its relative suitability. Finland, for instance, has immense resources of granite but its vernacular buildings were built of wood from the vast forests. Japanese builders constructed their traditional *minka* houses in timber, even though stone was available; for adherents of the Japanese Shinto religion the choice of a living material was a spiritual matter.

Timber has been extensively used and is renewable over time, though the destruction of the forests makes building wood structures unfeasible in many countries. Log construction, with round or squared timber notched to provide secure and interlocking corner joints, is basic to the vernacular traditions of Scandinavia, eastern Europe, and the Alps, from where it was brought by migrants to the United States. An alternative system is timber framing, in which a box-like skeleton is made of jointed wood, the panels being filled with wattle-and-daub, or with bricks laid in patterns as they are in northern Germany.

In some tropical regions timber is less readily obtainable, so bamboo, which is technically a grass, is grown and used for building. Fast growing and flexible, it is employed as a structural material in Southeast Asia and Indonesia, but it is also stripped and made into matting for lightweight walls and roof covering. Palm leaves are often used for wall cladding and for thatching roofs in the Pacific islands, but the principal thatching materials in much of the world are grass

or reed. Bundled and secured in overlapping layers, thatch provides a water-resistant cover as effectively for a rectangular plan as for a circular one. Vernacular builders have employed natural materials for centuries, but by replanting and recycling them, and by passing on their practices to succeeding generations, they have been able to remain in the same locations without depleting the resources of their environments.

Vernacular architecture has shaped the buildings of the world's peoples throughout history, but it has been largely overlooked by architectural historians and educators who may dismiss it as primitive. Though most traditions could benefit from improved servicing with electricity, piped water, and modern sanitation, vernacular architecture still has a major part to play in the development of a built environment that is both responsive and responsible in an era of rapid population growth.

Since the fourth century BCE, the works of Aristotle—student to Plato, tutor to Alexander the Great, and founder of the Lyceum—have profoundly influenced a variety of fields, including the natural sciences, logic, and political science. His method of combining rigorous observation with a carefully crafted theoretical framework laid the foundation upon which future thinkers and scientists would build.

Aristotle was one of the most important and prolific of all ancient philosophers. Born in the town of Stageira in northern Greece, Aristotle had an immediate environment of intellectual inquiry. His father, Nicomachus, was physician at the court of Macedonian King Amyntas II. At the age of eighteen Aristotle traveled to Athens to study at the Academy of the Greek philosopher Plato. He remained there for twenty years, until Plato's death. Afterward, perhaps disappointed at the choice of the philosopher Speusippus as Plato's successor, Aristotle accepted an invitation from Hermias, ruler of Assos (in modern Turkey). While at the court of Hermias, he pursued both academic and private interests, beginning an extensive period of field research in the natural environment and marrying Hermias's daughter, Pythias.

After the fall of Hermias in 345, Aristotle accepted an invitation from King Philip II of Macedon to come to his court in Pella to tutor the young prince, Alexander of Macedon (popularly known as Alexander the Great). The influence of Aristotle over the young Alexander has been much overstated, and their relationship seems to have been formal rather than warm. Nevertheless, Alexander did take Callisthenes,

This marble bust of Aristotle is a Roman copy after a Greek bronze by Lysippus, circa 330 BCE. The alabaster mantle is a more recent addition. Ludovisi Collection.

Aristotle's nephew and collaborator, with him on his expedition to Asia to act as court historian.

Shortly after Alexander's departure for Asia, Aristotle returned to Athens, where he set up his own philosophical school known as the "Lyceum" in an area outside the city walls. The philosophical style of thinking that he founded there was known in antiquity as "peripatetic," from a colonnade (*peripatos*)

An 1885 illustration depicts Aristotle and his pupil, Alexander the Great. New York Public Library.

at the Lyceum. Aristotle remained in Athens until after the death of Alexander, when an outburst of anti-Macedonian sentiment made it unsafe for him. During this time in Athens, his wife died. Aristotle preferred not to remarry, living instead with a slave, Herpyllis, who bore him a son, Nicomachus. Aristotle died soon after his retirement from Athens, and his successor, both as the head of the Lyceum and as the heir to his papers, was Theophrastus, his longtime student, collaborator, and colleague.

Aristotle was a prolific writer on an enormous range of subjects. Like Plato, he wrote dialogues, although these survive only in fragments and quotations. The greater part of his published work is summaries and notes of his teaching. Aristotle's principal concern was, as with the pre-Socratics (a group of fifth-century Greek philosophers), the description, analysis, and understanding of the natural world. He was an acute and precise observer, and he applied his scientific acumen in an astonishing variety of fields. He was an especially skilled biological taxonomist, identifying literally hundreds of species of animals. He also

brought geological, chemical, and meteorological observations to his study of the weather. This combination in itself is representative of his underlying methodology, which was to marry rigorous empirical observations in the field with a carefully crafted analytical and theoretic framework. This marriage was not always possible. His contributions to physics, although naturalistic in their conception, are highly theoretical.

Aristotle was not interested only in the natural world. He also took the human world as a subject for study. He was, perhaps, the first political scientist, seeking to catalogue and examine a range of constitutional arrangements. This examination led to the construction of his highly influential work, *The Politics*, which provides both a taxonomy (system of classification) and an explanation of political behavior based on theories of self-interest. It remains a core text of political theory. He also sought to collect constitutional histories of Greek city-states, and 158 constitutions were so described. For the most part, these works do not survive except as fragmentary

All human actions have one or more of these seven causes: chance, nature, compulsion, habit, reason, passion, and desire. • Aristotle (384–322 BCE)

quotations embedded in later works. The exception is the *Constitution of Athens* (*Athenaion Politeia*), which was not written by Aristotle himself but probably by one of his students.

Another enormous philosophical contribution was in his employment of formal logic. Rather than examine arguments by their capacity to persuade, Aristotle preferred to test their internal consistency. In order to do this, he devised a kind of algebra of logic, which formal logicians still employ in their deliberations.

Aristotle was a genuine polymath (a person of encyclopedic learning). As such, he asserted the interconnectedness of knowledge (what the U.S. biologist Edward O. Wilson has called “consilience”) as well as its underlying coherence. Although Aristotle was not exclusively and obsessively empirical, he preferred not to engage in explicit speculation about the nature of broad concepts. Here, later generations saw his sharpest contrast with Plato. Plato’s theory of forms, in particular, and the idealism that emerges from it, have been seen as a clear and sharp contrast with Aristotle’s acute and rigorous empiricism.

Much of Aristotle’s work survived antiquity by translation into Arabic. His approach influenced generations of Arab thinkers as well as the scientific and, through the Italian religious philosopher Thomas Aquinas, theological traditions of medieval Europe. By then, however, Aristotle’s conclusions had been turned into dogma and were overturned only by a more rigorous application of his own methodology.

Art—Africa

Since ancient times trade routes from Europe, the Middle East, and Asia disseminated ideas, objects, and cultures—as well as Christianity and Islam—to the African continent. African art, which reflects all of these influences and exchanges, is an important lens through which to view world history, and an important field of study in its own right.

Africa, a participant in the global spread of objects, ideas, and people that characterizes the world today, has produced some of the world's earliest preserved works of art and some of its most exciting contemporary ones. The study of African art began in the early twentieth century, and for much of its development focused solely on the area south of the Sahara and on art forms rooted in precolonial culture, which was seen as static and timeless. Egypt and northern Africa were seen as separate entities. The colonial and postcolonial eras were viewed as periods of decline in African art, due to what were seen as negative outside influences in materials, techniques, subject matter, style, and patronage. In contrast, recent scholarship takes a more inclusive and historically dynamic view. The continent is treated as an integrated whole and the changes of the past century are seen as continuing the evolution that African art has experienced throughout its history. Research today focuses on the artistic interconnections between geographic regions, ethnic groups, and time periods, and contemporary art is given equal footing with so-called traditional forms.

Ancient African Art

The earliest known works of art from Africa are the paintings of animals found on rocks in the Apollo

11 cave in southern Namibia (so-named because they were discovered in July 1969 when the spacecraft landed on the moon). These have been dated 26,500–24,300 BCE, making them as old or older than the Paleolithic cave paintings of western Europe. Rock paintings and engravings are also found in East Africa and North Africa, particularly in what is now the Sahara; these depictions of animals and humans document the change from the lush, well-watered grasslands of around 8000 BCE to the arid conditions we know today. As the Sahara became drier, its human inhabitants were forced to move, and many of them settled in the Nile Valley, where they contributed to the development of ancient Egyptian and Nubian culture and art.

The earliest known sculptures from Africa south of the Sahara are those from the Nok culture of northern Nigeria, dated 800 BCE to 200 CE. Despite their early date, the Nok sculptures already show visual elements characteristic of African art from later periods. They depict facial features and body parts as abstract geometric shapes, and they alter the natural proportions of the body to emphasize the head. They portray the elaborate hairstyles and beaded body ornaments that are also an important part of the dress of many later African peoples.

During the first millennium CE the cultural features that characterized sub-Saharan African societies until the late nineteenth century were established, such as states based on sacred kingship, long-distance trade, urbanism (especially in west Africa), and various forms of social and religious organization. All of these contributed to the evolution of African visual arts.

West Africa's first city, Jenne-Jeno, was well established by 800 CE in the inland delta region of the

Niger River in present-day Mali. Sophisticated and expressive terracotta sculptures were produced there, primarily between the thirteenth and sixteenth centuries. Some depict figures with the trappings of leadership, others are possibly in positions of prayer, and still others appears tormented by diseases or snakes. Little is known about the function of these figures, since the majority of them have been illicitly excavated. Archaeologists believe they were used in domestic rituals, perhaps to ensure the solid foundation of a house and the family within it. Jenne-Jeno was part of a vast trading network that stretched north across the Sahara and south to the forests along the coast of west Africa. There, the site of Igbo-Ukwu in southeastern Nigeria produced lavishly decorated bronze objects using an indigenously developed lost-wax technique. (The technique involves coating a wax model in plaster and clay, leaving a small hole in the bottom; when the model is heated, the clay and plaster harden, and the wax melts (i.e., gets “lost” through the hole. Then the sculptor pours molten bronze into the cavity, and when the bronze cools, chips away the outer layer of plaster and clay.) Made in the ninth or tenth century, these were the regalia of a local priest-king. The city of Ile-Ife in southwestern Nigeria, still a political and spiritual center today, had its artistic flowering between 1000 and 1400. During that period the city’s artists created sculptures whose pronounced naturalism stands out from most other African art, past or present. Most of these idealized portraits were made of clay, but others were made of brass and copper (which is not found naturally in Nigeria), demonstrating Ile-Ife’s long-distance trading connections.

Christianity and Islam were introduced into Africa soon after their inception and quickly found expression in African art and architecture. At first African Christianity was limited to Egypt and Ethiopia, where the rock-cut churches of Lalibela (in Ethiopia) and boldly colored illuminated manuscripts and icons constitute important contributions to Christian art. The Great Mosque at Kairouan in Tunisia, built of stone in the ninth century, is one of the oldest mosques in existence. The Great

Mosque at Jenne, the Muslim city that arose next to Jenne-Jeno, is typical of west African Islamic architecture in its use of sun-dried mud bricks and strongly projecting engaged pillars and towers along its facade.

When the earliest European explorers arrived in Africa in the fifteenth and sixteenth centuries, they found several thriving kingdoms as well as smaller social units producing notable works of art. In the Kingdom of Benin in Nigeria, ivory carvers and brass casters produced thousands of works of art for use in court rituals that strengthened the spiritual power, authority, and grandeur of the Oba, or divine king. Notable among these were brass heads representing ancestors, ivory tusks carved in relief with figures from Benin history, and brass palace plaques that depicted the panoply of the Benin court hierarchy. In the Kongo Kingdom luxurious textiles of raffia fiber and fly whisks made of ivory distinguished the rulers and other wealthy and powerful people. Brass crucifixes modeled after European prototypes testified to the adaptation to local styles and ideology of objects introduced by Christian missionaries. At Great Zimbabwe, monumental stone buildings, rare elsewhere in sub-Saharan Africa, were created as the residences and ritual centers for rulers from 1300 to 1450.

The Modern Era

Most of the African art known today through museum collections and publications was made in the nineteenth and twentieth centuries. This was a period of great change in Africa, as political, religious, and cultural practices were forced to adapt to new conditions brought about by colonialism and, later, independence. Nevertheless, the art made at this time, and the context in which it was used, have formed the image of “traditional” African art that has dominated the study of the field. The following examples provide only a brief glimpse of the variety and complexity of African art in this period. Many of these art forms still thrive, although they continue to change, as they always have, in response to new circumstances.

The Bamana people of Mali are primarily subsistence farmers who live in independent villages led by male elders. Their art consists of wooden masks and sculptures made for the performances and rituals of men’s initiation associations. These associations embody spiritual powers, and their members wield social and political authority within Bamana villages. One such association, Komo, utilizes large wooden helmet masks depicting fantastic animals with projecting jaws and domed heads. Komo masks are covered with a thick crust of sacrificial materials, such as animal blood, plant matter, and sacred earths. These materials, along with added animal parts such as horns, tusks, feathers, and quills, imbue Komo masks with spiritual force and refer to secret knowledge used to keep the village safe from physical or spiritual harm. In contrast to the mask’s intimidating appearance and serious function, the wooden headdresses of the Chi Wara association are intricate and elegant, and the performances in which they are worn entertaining. They represent stylized antelopes that honor the mythical being that brought agriculture to the Bamana.

Unlike the Bamana, the Akan people of Ghana are organized into highly centralized and hierarchical states headed by hereditary chiefs who have maintained their status and authority, although much of

Ancient stamp-pattern designs from Ghana lend themselves for use in both fabric and paper printmaking.

their power has been taken over by Ghana’s national government. Akan arts reflect the wealth derived from the region’s vast gold deposits and the multifaceted concepts of power associated with Akan chiefs. Prominent among Akan art forms intended for use by chiefs: cast-gold ornaments and staffs, and other regalia covered with gold leaf—all of which depict animals, humans, and objects that illustrate proverbs concerning the nature and responsibilities of leadership. Brilliantly colored and elaborately woven silk and, more recently, rayon textiles called *kente* are also worn by Akan elite to signify their power, wealth, and status.

The arts of the Kuba people of the Democratic Republic of the Congo are similarly focused on leadership and power. Kuba kings are depicted in idealized portraits carved of wood that are believed to house their spiritual essence. Titleholders wear elaborate garments made of woven, appliquéd, and embroidered raffia fiber textiles along with accessories and regalia covered with cowrie shells, glass beads, and

feathers. Kuba wood masks, worn at initiations and funerals, are similarly covered with a dazzling profusion of colors, patterns, and textures. It should be noted that versions of all the art forms mentioned in this article—including the regalia intended only for Kuba titleholders—are made for the foreign market.

Works made by the Zulu people of South Africa, pastoralists who rose to power in the early nineteenth century on the basis of their military strength, reflect yet another aspect of African art. The Zulu rarely make masks or sculptures; utilitarian objects, such as wooden headrests, milk pails, meat plates, and ceramic beer vessels, predominate. These are often decorated with chevron patterns or raised bumps that refer to the ancestors and to herds of cattle that confer wealth and status. Garments and ornaments decorated with colorful glass beads in geometric patterns express the wearer's prestige, gender, and marital status. During the struggle against apartheid, some black South Africans wore beaded garments and ornaments to express their opposition to the white government's ethnic and racial policies. More recently beaded objects have been made as part of the effort to promote awareness of the problem of HIV/AIDS in South Africa.

At the beginning of the twentieth century European avant-garde artists, such as Pablo Picasso and Henri Matisse in France and Ernst Ludwig Kirchner and Max Pechstein in Germany, discovered works of African art in ethnographic museums and curio shops. The geometric forms, freedom from naturalistic representations, and vibrant colors of the African objects corresponded to artistic concerns in their own work, and provided a source of inspiration for European art movements such as Cubism and German Expressionism.

During the colonial period, government policies, the spread of Christianity and Islam, and new forms of education, employment, and health care often undermined the structures of political, economic, religious, and family life that had been the context for creating and using art in Africa. Art forms and cultural practices adapted to the new circumstances.

Helmet Mask, "Mulwalwa." Democratic Republic of Kongo, Southern Kuba, nineteenth or early twentieth century. Wood, paint, raffia, brass nails. Collection of the Ethnological Museum, Berlin-Dahlem.

Artists began to incorporate newly available materials (such as oil-based enamel paints, factory-woven cloth, and chemical dyes) and newly observed imagery (such as Western-style clothing and automobiles). These innovations demonstrate the vitality and resilience of African art and exemplify its long history of adapting to changing circumstances.

Trends and New Expressions

These developments intensified after World War II as the movement for liberation from colonial rule gained

strength and finally culminated in independence for most African nations around 1960. As more and more Africans were exposed to European modes of education and art production in the second half of the twentieth century, distinctive new forms of (and contexts for) African art emerged. Expatriate Europeans in the 1960s established artist workshops in several parts of Africa. The Mbari Mbayo workshop in Oshogbo, Nigeria, and a workshop founded at the National Gallery of Salisbury, Rhodesia (now Harare, Zimbabwe), are prime examples. Participants were provided with materials and studio space, but training was deliberately minimal to allow the artists' innate creativity to emerge. The results, by artists such as Twins Seven Seven of Nigeria (b. 1944) and Thomas Mukarobgwa of Zimbabwe (1924–1999), emphasize abstraction, expressive color or form, and mythic subject matter.

Another trend in modern African art developed out of the painted shop signs ubiquitous in African towns and cities. In the genre known as "urban popular painting," works are often mass-produced and sold to African patrons as home decorations. They share the flat colors, emphasis on consumer goods, and incorporation of text seen in advertising art, and the intuitive perspective and inconsistent shading and scale of artists without formal art education. Tshibumba Kanda Matulu (b. mid-1940s; missing since early 1980s) of the Democratic Republic of Congo is one of the most accomplished of the urban popular artists. In addition to landscapes and other idealized subjects, he produced a moving series of paintings on the history of his country.

An increasing number of African artists have studied art in colleges or art schools either in Africa or abroad; their work reflects trends in art that are international in scope. In the 1960s, Bruce Onobrakpeya (b. 1932), Uche Okeke (b. 1933), and other Nigerian artists developed a philosophy of art called "natural synthesis" that was based on the fusion of indigenous African and modern European art styles. Their works expressed both the modernity of their newly independent nation and the traditions of African culture. Similar movements arose across Africa.

Since the 1990s, African artists have questioned the relevance of ethnic or national labels and even the relevance of African origin itself. Artists such as Yinka Shonibare (b. 1962 in London, to Nigerian parents), Ghada Amer (b. 1963 in Cairo, Egypt), and Berni Searle (b. 1964 in South Africa) investigate these and other concerns of the postcolonial and postmodern world through the means of conceptual art, using installation, performance, video, photography, and other worldwide contemporary art practices. When seen in its entirety, African art at the beginning of the twenty-first century is a complex mixture of local and global concerns, and ancient and innovative forms.

Art—Ancient Greece and Rome

Concepts of strength and dignity—and of ideal human beauty—inspired the sculptors who shaped early Greek monumental architecture and sculpture from marble. Romans, heavily influenced by the Etruscans (who themselves had borrowed from the Greeks), evoked traditional characteristics of the republic—economical, practical, structural—using concrete. Thus the art of both cultures embodies their age-old values.

The earliest monumental creations of classical Greece are the eighth-century BCE grave markers found in the Dipylon cemetery on the outskirts of ancient Athens. Their forms were familiar to everyone and had been for centuries as ordinary household pots used for storing food or mixing and decanting wine and water. Yet in their new context and in the hand of a truly inspired designer the experience created by them was of the very highest drama: these are not normal kitchen pots. They stand as tall as a man and as broad as a temple column. The drama of these monuments is generated by an unbelievable transformation in scale and is delivered to the viewer by a shocking disconnection between the expected and the experienced. The great Dipylon pots are uniquely valuable for understanding the most basic principles of Greek monumentality, because they represent first attempts. First attempts are significant because they represent conscious choices, not simply the repetition of tradition. And wherever conscious choice can be isolated there is the opportunity of uncovering meaning, for the question can be profitably asked, “Why did they solve the problem in this particular manner?”

The master of the first giant Dipylon pot might have asked himself the question, “How can I best design a monument that is suitable for marking and acknowledging the most profound of human transitions and transformations, from life to death, from flesh and blood to spiritual, from ephemeral to everlasting?” His answer was to create a monument that embodied a similarly incomprehensible transformation, both physical and functional, whose drama disorients the viewer, takes the viewer out of any normal, everyday frame of reference—transforms the viewer, and speaks through unambiguous metaphor of the passage from one state of being to the next. The transformation in scale and function of these great Dipylon pots lifts them out of the realm of everyday utility and into a higher, more symbolic, more universal realm. Their common reference to Homeric heroes in their painted decoration further monumentalizes these pots, further elevates them beyond the everyday.

Transformative Power: The Greek Temple

A similar conception of monumentality is expressed in Greek temple architecture, through the monumental transformation of the temple in the early seventh century BCE from a thatched and mud hut to a solid stone and terracotta colossus. This transformation first takes place in Corinth, which develops a distinctive style of pre-Doric monumental architecture that gradually evolves into the first full-fledged representative of the Doric order, the Temple of Artemis at Corfu (c. 580 BCE), a colony and dependency of Corinth. The transformative nature of Greek monumental architecture is enhanced by the innovation of the sculpted pediment,

an invention attributed to the Corinthians by the poet Pindar (522–443 BCE) and seemingly confirmed by its earliest appearance on Corfu, a Corinthian colony and dependency. More than any other feature the early sculpted pediments with their great frontal monsters condition the spirit of approach to the temple: if the approach to the temple was intended to reflect the approach to divinity, the purpose of the monsters was to transform any pilgrims who dared approach, to transport them beyond the protective boundaries of everyday life and into the contemplation of the terrifying nature of divinity and their relationship to it. The purpose of the great emblematic sculptural groups in the pediments was—like religious ritual—the spiritual transformation of the worshipper. Over the course of the sixth century BCE the pedimental instruments of engagement and confrontation become diluted, metamorphose from monsters to more familiar, less intimidating, human-shaped figures, indicating a change in the conception of temple divinity, from abstract, nonanthropomorphic, and chthonic (relating to the underworld) to anthropomorphic Olympian sky gods. This gradual humanization of divinity and consequent divinization of humanity is a theme that unites much of Greek art.

Egyptian Influences

The nature of monumental Greek art and architecture was profoundly affected by the opening of the trading colony Naukratis in Egypt in the later seventh century BCE. From this new and intense contact with Egypt came the inspiration for the peristyle (the continuous colonnade) in Greek temple architecture. The peristyle gave architectural expression to one of the most basic rituals of Ionian cult activity, religious procession: like pedimental sculpture, religious procession serves as a transforming ritual that prepares the worshipper for the approach to divinity. Emulating the processional function of Egyptian colonnades, the colossal peristyles of Ionia led through their formal arrangement to the front of the temple, then to the axis, then to the interior. Peristyles were also adopted on the Doric mainland,

but in that context their nature was not processional. Instead, a sense of hieratic direction and procession was lent to early Doric architecture by its pedimental sculpture, which followed and further established the early Greek hierarchy of narrative and emblem in religious art: storytelling is associated with a secondary position, the more human realm, at the back of the temple, while the more abstract convention, the emblem, is appropriate for the suggestion of divinity at the front of the temple.

It was also through Naukratis that the Egyptian conception and technique of monumental freestanding

An ancient mural depicting a scene from Homer's *Odyssey*, one of many such Hellenistic works found on the Esquiline Hill, Rome.

sculpture was introduced to Greece. Beginning in the late seventh century, *kouroi* (male) and *korai* (female) appear as votives and grave markers and, perhaps, as cult images. There is probably a causal relationship between the appearance of this sculpture and the coincidental relegation of pottery to an almost exclusively non-monumental realm. The physical nature of *kouroi* and *korai* makes them particularly appropriate as indicators and inspirers of spiritual transition. Like the religious sculpture of Egypt, they are represented as highly formalized compositions, more religious emblem or hieroglyph than naturalistic representation of humans. Their tight symmetry and stylization intentionally and effectively separates them from the strictly human realm, removes them from the everyday, and places them in a mediating position between human and divine. On the other hand, as in vase painting and pedimental sculpture, an increasing interest in the examination of things human is witnessed in sixth-century freestanding sculpture in the increasingly naturalistic modeling of the body. This parallels the change to the more human conception of temple divinity as represented in pedimental sculpture, and reflects the increasingly central role humans play in the Greek conception of the cosmos.

The Classical Period

The increasingly detailed examination in art of the human condition, physical and emotional, continued unbroken into the classical period (beginning in 480 BCE with the Persian sack of the Athenian Acropolis). This movement toward naturalism, however, was potentially inimical to the goals of monumentality, as the goals of monumental art and architecture had always been to lift viewers out of the ordinary, beyond the everyday, and into the contemplation of forces greater than themselves: how could increasingly human representations lift humans beyond their own environment, inspire in them the contemplation and understanding of something superhuman, of the divine realm? This seems to have been recognized by the mid-fifth-century sculptor Polykleitos, who reintroduced the formal symmetry of *kouroi* to his compositions, though along diagonal axes rather than in the strictly vertical and horizontal framework of sixth-century sculpture. The decision of Phidias, the sculptor of the Parthenon, to ignore the developing techniques of representing individual characteristics of age, emotion, and character in favor of uniformly abstracted, ageless, “idealized” figures similarly indicates an analytical

appreciation of the traditional character and techniques of monumental Greek art.

The Periclean building program on the Athenian Acropolis, undertaken in the aftermath of the Persian destruction of Athens, is perhaps the most elaborate expression of monumental art and architecture ever created in Greece. Its religious roots and purpose are evident in the detailed expression of religious procession through the organization of building types, the organization of their pedimental sculpture, and the incorporation of the processional language of Ionic temple architecture into the Doric tradition of the Acropolis. Its political and historical context and tradition are expressed through the many references to the Persian War, both metaphorical and literal, through the cults of legendary heroes, and through the use of the Ionic order as a reflection of Athens's ancient genetic and linguistic connections with Ionia and of its present position at the head of an Ionian alliance against the Persians. The explicit celebration of the accomplishments and traditions of the Athenians in the religious monuments of their central sanctuary is a remarkable deviation from canon and represents an extreme evolution of the humanization of divinity and divinization of humanity in Greek art and architecture.

After the hiatus of Phidian sculpture, the examination of the human condition in ever-increasing detail recommenced with renewed energy in the fourth century BCE and soon resulted in the monumental representation of generalized but, nevertheless, individual human beings. In the Hellenistic Age (the period beginning with the death of Alexander III of Macedon [Alexander the Great] in 323 BCE and ending with the Battle of Actium in 31 BCE) the gradual humanization of divinity in Greek art culminated in the worship and monumental representation of

Hellenistic rulers as gods. Similarly, while mythical or divine representation or reference served as an elevating agent of monumentality in earlier Greek art, reference to, or even quotation of, the buildings and sculpture of the Periclean Acropolis became a common agent of monumentality in the official art and architecture of the Hellenistic kingdoms of Greece, particularly of Pergamon.

Corinth and the Etruscans: Greek Influence on Rome

The connections between Greece and Rome are almost as old as the cultures themselves, and the Romans themselves traced the origins of monumental temple architecture in Rome back to mid-seventh-century Corinth. Around the time that the Corinthians were designing and building the first truly monumental temple in Greece, the old ruling oligarchy was overthrown and expelled from Corinth. When one of the deposed oligarchs, Damaratus, fled by ship from Corinth he carried with him a host of artisans, including terracotta workers, craftsmen we now know were most responsible for the monumental character of that temple—through their invention of the tiled roof. Damaratus sailed with them to the west coast of Italy and settled in the Etruscan town of Tarquinia, where Damaratus's artisans introduced the Etruscans—who became the greatest terracotta sculptors of the Mediterranean—to the art of molding terracotta. So, in addition to developing the first tradition of monumental architecture in Greece, Corinth was also a crucial source for the origins of monumental sculpture and architecture in Etruria. Damaratus then extended Corinth's artistic and cultural influence to Rome itself through his half-Etruscan son

The Gorgon medusa from the Temple of Artemis, Corfu. Early, sculpted pediments were adorned with frontal views of mythological monsters.

Lucumo, who later took the name Lucius Tarquinius Priscus and became the first Etruscan king of Rome. On the heights of the Capitoline Hill in Rome, the central peak and religious center of Etruscan and Latin Rome, Tarquinius initiated the construction of the first monumental temple in Rome, dedicated to Jupiter, Juno, and Minerva, the same three divinities that in their Greek guise of Zeus, Hera, and Athena dominated the central height and religious center of Corinth. This cult of the Capitoline Triad became the central cult of the Roman republic and empire, and the triple-chambered plan of their temple, completed after the Etruscans were expelled from Rome at the end of the sixth century BCE, formed the template for all subsequent Capitolia.

From the Etruscans the Romans inherited the tradition of monumental wood and terracotta temple architecture. They were also deeply influenced by Etruscan sculpture, painting, and religious and political institutions. The tradition of Roman portraiture, a paradigmatic manifestation of an innate Roman fascination with the literal details of history, finds its roots in Etruscan funerary sculpture that goes back to the seventh century BCE. As much as any other art form, the super-realistic, warts-and-all portraiture of republican Rome (509–27 BCE) embodies the traditional Roman dedication to history, family, and age-old values. And as much as any other art form, the conception and appearance of Roman republican portraiture stands in opposition to the traditional Greek conception of monumental art. Through generalization and stylization monumental Greek art was intended to lift the viewer out of the everyday and into the consideration of superhuman forms and forces; Roman republican portraiture encouraged the contemplation of the thoughts and actions of specific, individual human beings through the reproduction of their most individualized, idiosyncratic physical attributes. A similar dichotomy is expressed in the contrast between the native tradition of Roman historical relief sculpture, which depicts the literal details of actual historical events, and the more generalized, emblematic references to history made in the monuments of the Greeks.

The owl, signifying strength and wisdom, is the symbol of Athena, the patron goddess of Athens. Photo taken in 2003.

An Evolving Balance

The most profound wave of Greek influence on the Romans came with the Roman sack of Corinth in 146 BCE. The city was stripped of its sculpture and painting and almost any movable object of value, and it was all shipped to Rome, where it kindled a mighty taste for things Greek and antique and injected a permanent and powerful strain of Hellenism into the art and architecture of Rome. From the second century BCE Roman art and architecture can be read as a constant and intentional shifting—depending upon the specific purpose of the monument—of the balance of native Italic elements and those adopted from classical Greece. The Romans continue to build their temples according to their own traditional Tuscan plan (adopted from the Etruscans), but they consistently

monumentalize those temples by veneering them with the materials and decorative orders of the Greeks.

A century later the emperor Augustus (reigned 27 BCE–14 CE) claimed to have found Rome a city of brick and left it a city of marble. Augustus's statue at Prima Porta illustrates well the early integration of Hellenic and Italic forms and spirit in the service of the official message of the state. It combines a recognizable portrait head of Augustus with the body of the famous Doryphoros, the "Spearbearer" of the fifth-century BCE Greek sculptor Polykleitos. The Doryphoros is presented in the armor of a Roman general, the commander in chief, and wears a cuirass that carries the representation in relief of a historical event, a military accomplishment significant to the official image of Augustus. A recognizable, individual human being and a specific historical event are magnified, elevated to the realm of the superhuman through their association with fifth-century Greece, with Periclean Athens and its own remarkable cultural and military accomplishments, the apex, in the Roman mind, of human achievement. The same mixture and purpose is found in Augustus's Altar of Peace (the *Ara pacis*), which presents a historical procession of individually recognizable Romans in the guise of the religious procession depicted on the Ionic frieze of the fifth-century Parthenon in Athens.

Augustus and his Julio-Claudian successors (reigned 14–68 CE) continued to present themselves in official art and architecture in the guise of fifth-century Greece. Even their portrait heads, while recognizable as individual emperors, were generalized and idealized in the manner of classical Greek art. When, however, their grotesque excesses and abuses of power led to the overthrow of Nero (reigned 54–68 CE) and the ruling dynasty, the first Flavian emperor, Vespasian (reigned 69–79 CE), openly distanced himself from the policies and character of his predecessors by changing the balance in the language of official state art. Instead of representing him as Doryphoros, Vespasian's official images returned to the style of the old republican portraits—straightforward, literal, unpretentious, uniquely Roman—and proclaimed a return to the traditional values of the republic. In

The realistic rendering of an elderly Roman man, circa 60 BCE, embodies the traditional Roman dedication to history, family, and age-old values.
Bevilacqua Palace, Verona.

architecture he encouraged the use of concrete, a purely Roman building material and the most important Roman architectural contribution to posterity. The Amphitheatrum Flavium, the Colosseum, was not only the largest and most elaborate concrete structure in Rome, but it also denied the divine pretensions of the Julio-Claudian emperors and their profligate abuse of the Roman treasury for their own individual desires through its function as an entertainment center for the common people and through the site of its construction, on the newly filled-in lake in the center of Nero's notorious Golden House, or Domus Aurea. This structure was built with state funds in the center of Rome as Nero's personal pleasure villa; he

appropriated over three hundred acres in the center of the city for its construction. Paradoxically, Nero's architects had also made great use of concrete, but in the private context of Nero's Golden House, where they experimented with the possibilities of concrete for molding interior space in new and fantastic ways. Their discoveries were profoundly influential in creating a Roman architecture of interiors.

The ways in which concrete and marble are used in Roman architecture can serve as a metaphor for the Roman character. In general, concrete formed the structure of the building, marble its veneer: carefully carved marble revetment could make a concrete building look as elegant as the Parthenon. Like the traditional characteristics of the republic—economical, practical, structural—concrete is purely Roman. Marble, on the other hand, as employed in Roman buildings, is expensive, luxurious, superficial, and foreign. While concrete reflects the native character of the Romans, marble reflects the aspirations of the Romans to the cultural heights of Pericles and fifth-century Athens.

Not until the reign of the emperor Trajan (reigned 98–117 CE) is concrete and its protective brick facing presented in unveneered reality as an appropriate surface for monumental architecture. The great curved façade of the Markets of Trajan reflects the molded nature of concrete, and the unstuccoed, unveneered brick surface reveals the fabric and techniques of its structure and initiates a new aesthetic in Roman architecture. Appropriately, this vast concrete building is dedicated to the practical pursuit of business; immediately next door, the contemporary Forum of Trajan, whose function is the symbolic representation of the aspirations and accomplishments of the Roman state under Trajan, is presented in the full glory of the classical Greek marble architectural orders.

Perhaps the most remarkable integration of traditional Roman and classical Greek architectural forms and symbols is found in the Pantheon of Trajan's successor Hadrian (reigned 117–138 CE). Here the façade of a Greek temple is wedded to a completely un-Greek and purely Roman structure, a concrete, domed cylinder. In addition, the most elaborate

architectural symbol of religious transition ever created in Greece, the Propylaia (the great gateway of the Periclean Acropolis), is directly referenced in the stacked pediments of the façade, which, in turn, are combined with the uniquely Roman symbol of transition, the triumphal arch, to form the most explicitly processional temple entrance ever created in the classical world. The entrance leads into an immense open interior whose dome (representing the vault of the heavens) is the culmination of decades of experimentation and mastery of the techniques and design of concrete architecture. Here, rather than emphasizing the distinct natures of Greek and Roman architecture, the expressive potential of both is consciously synthesized to create a temple uniquely appropriate to the inclusive, international worship of "all gods," (pan-theon) and consequently to promote Hadrian's own inclusive, international conception of the Roman Empire.

Succeeding emperors continued to create monumental art and architecture in the tradition of Hadrian and his predecessors, and continued to explore the possibilities of concrete as a monumental architectural medium. Classical Greek and native Italic elements continued to be used to express specific official messages and attitudes, though on the whole that balance shifted toward the Italic over the next two centuries. In sculpture this shift expressed itself in part in the increasing interest in frontal representation and in simple, clearly outlined figures. That, coupled with a new spirituality that increasingly expressed itself in an emphasis on the eyes, gradually led to the more emblematic, iconic relief sculpture and portraits of the late empire. Constantine the Great (Constantine I, reigned 306–337) employed the tools of official art and architecture to great advantage, and as the first of the Roman emperors to convert to Christianity, began to direct those tools toward the glorification and propagation of his new religion.

The art of Central Asia is critically important to world historians because it provides evidence of the extraordinary synthesis of cultural influences that so typify the history of the region. This blending of Mediterranean, Iranian, Indian, Chinese, steppe nomadic, and local techniques and motifs that occurred at the “crossroads of Eurasia” resulted in the emergence of several major syncretistic schools of art.

Central Asian art needs to be clearly distinguished from the other artistic traditions of Inner Eurasia. Geographically, the term denotes the arts of modern-day Afghanistan, Pakistan, northern India, Nepal, Xinjiang Province in northwestern China, Tajikistan, Kyrgyzstan, Uzbekistan, and Turkmenistan, whereas Inner Eurasia also includes Mongolia, the Gobi, and central Siberia. It is culturally and stylistically different from Islamic, Indian, Chinese, and Russian arts, although these styles have all been practiced within the region. Historically, Central Asian art dates from prehistoric times to the present, with the ancient Silk Roads era being the most significant. Media have included sculpture and engraving in a variety of stone and stucco, as well as wall paintings, coin engravings, and textiles.

In the oasis towns of Central Asia, artists from a variety of cultures worked together to produce both sacred and secular art, which was then transported along the trade routes to profoundly influence the subsequent art of East Asia in particular. This essay offers a brief survey of Central Asian art in a chronological framework.

Pre-Achaemenid

The history of Central Asia from the late Neolithic period (c. 6000–3000 BCE) until quite recently has been characterized by the interaction between sedentary agrarian and nomadic pastoralist communities. The original inhabitants of the region lived in small semi-sedentary settlements. More substantial colonization followed as a direct result of the migration of Indo-European- and Indo-Iranian-speaking pastoralists into the region in three waves from approximately 4000 BCE. An important urban civilization emerged in the valleys of the Amu Dar'ya and Zeravshan rivers late in the third millennium BCE, originally known as the Bactrian-Margiana archaeological complex (BMAC), but “Oxus Civilization” is the term now more commonly used. Oxus Civilization oasis sites were probably agricultural communities developed to facilitate trade and exchange between the indigenous sedentary agriculturists and the neighboring steppe-nomadic pastoralists, evidence of the early emergence of a tradition of cultural exchange.

Artifacts discovered in Oxus Civilization sites—particularly battle-axes with cross-guards, mirrors, pins, bracelets, and rings—demonstrate high levels of craftsmanship and the borrowing of styles. Oxus Civilization potters used the wheel from as early as the third millennium BCE and decorated their works with geometric designs or stylized renderings of large animals and goats. The iconography of seals, cylinders, and metal ornaments is clearly of steppe-nomadic tradition—which includes both

realistic and fantastic animal images (particularly horses), mythical raptor-headed creatures, hunting and riding images, and some abstract symbol—while later artifacts are more Iranian in appearance, featuring human figures in full-frontal or profile poses, often sacrificing before a small fire altar. The Oxus Civilization declined late in the second millennium, although soon after 1000 BCE there is evidence of renewed urbanization and the construction of extensive irrigation systems. These settlements were extensively fortified, providing evidence of increased levels of conflict during what is known as the Scythian era (c. 1000–200 BCE).

The militarized Scythian tribes, who were active in Central Asia from the seventh century BCE, were responsible for the production of superbly decorative objects, particularly jewelry and trappings on horses, tents, and wagons. Scythic representations of real or imagined beasts were worked into a wide range of materials, including wood, leather, bone, appliqué felt, bronze, iron, silver, gold, and electrum. Outstanding examples are gold belt buckles, often with turquoise inlay, and 30-centimeter-long gold stags with their legs tucked under them, which may have been used as central ornaments on shields. The 1979 discovery at Tillya Tepe in Afghanistan of six royal graves replete with magnificent gold and lapis lazuli jewelry and weapons demonstrates the extraordinary artistic achievements of (probably) Scythian craftsmanship. The easternmost outpost of Scythian culture was the Ili River valley (in present-day southeastern Kazakhstan and northwestern Xinjiang Province, China), where they may have influenced the artistic tastes of the Xiongnu tribal confederation. A range of personal ornaments discovered at the major Xiongnu site of Noin-Ula depict fantastic animals with raptor-headed appendages, similar to those created by steppe-nomadic peoples from further west.

An important sedentary civilization also emerged in the Indus Valley during the third millennium BCE. The excavation of large cities such as Mohenjo Daro and Harappa provides evidence of a tightly organized, architecturally sophisticated urban society with straight streets intersecting at right angles,

This gold ram, a headdress ornament, displays the extraordinary craftsmanship of the Scythians. From Tillya Tepe, Tomb IV (first century BCE–first century CE). National Museum of Afghanistan ©Thierry Ollivier / Musée Guimet (www.nga.gov).

sophisticated drainage systems, and high standards of pottery production. Venus fertility figurines have been found at various sites, demonstrating extensive levels of cultural exchange with the civilizations of southwestern Asia. Stamps and seals from the Indus civilization depict naturalistic animals, but also horned humans, unicorns, and other large figures that might be gods, indicating possible steppe-nomadic influence upon artists.

Further north in the Indus Valley some 35,000 petroglyphs and inscriptions have been discovered, and others are known in Afghanistan, Uzbekistan,

A terracotta fertility figure from the Indus Valley civilization (c. 2200 BCE) provides evidence of cultural exchange with southwestern Asia. The National Fund for Cultural Heritage.

and Tajikistan. The oldest carvings, which are pecked or chiseled into the surface of boulders scattered on the riverbanks and terraces, are prehistoric, mostly depicting animals, hunting scenes, and demon-like creatures. The petroglyphs continued to be cut until the early modern era and provide evidence of the

changing religious practices of travelers (notably of Buddhism and Islam) along this branch of the Silk Roads. They depict an astonishing array of stupas (burial mounds and reliquaries) with the Buddha in various poses, and bodhisattva figures; later petroglyphs feature Indian and Iranian iconography, including some Zoroastrian and later Islamic symbols.

Achaemenids and Greeks

The relative isolation of small, fortified city-states in Central Asia made them vulnerable to attacks from the armies of major agrarian civilizations to the west. By the mid-sixth century BCE the Achaemenids (an Iranian dynasty that held power from the seventh century BCE through 330 BCE) had incorporated Bactria (ancient Afghanistan) and Sogdia (ancient Turkmenistan and Uzbekistan) into their empire. These regions were thus exposed to the artistic traditions and belief systems of Iran until the arrival of Alexander III of Macedon (Alexander the Great) in 329 BCE. This long period of incorporation into the durable and tightly organized Persian Empire helped establish the region as part of a Eurasia-wide cultural exchange network. Central Asia was exposed to Zoroastrian iconography, and small votive figurines produced by potters in Bactria and Sogdia were designed to be used in fire-worshipping ceremonies. The Achaemenids also introduced the first coins into Central Asia, establishing a tradition that would culminate under the Greco-Bactrians in arguably the finest example of the coin engravers' art known in the ancient world.

Alexander campaigned in Bactria and Sogdia for two years, establishing a number of cities, including Alexandria-Kapisu (Begram in Afghanistan), which the Kushans later made their summer capital. Alexander's campaign reinforced the process begun by the Achaemenids and further linked Central Asia to the civilizations of southwestern Asia and the Mediterranean. Greek populations flooded into the region during the subsequent Seleucid (Macedonian Greek) era (312–64 BCE), founding a string of Greek towns such as Ay Khanum on the southern banks of the

Amu Dar'ya, complete with classical Greek temples and theaters. The Seleucids also issued tetradrachms that are masterpieces in the Greek tradition of coinage, with superb portraits of kings on the reverse that are sometimes realistic enough to reveal symptoms of disease, such as goiter.

Around 250 BCE Diodotus, the Seleucid satrap of Bactria, revolted and declared Bactria an independent state. During the subsequent Greco-Bactrian era a series of kings expanded their realms into Sogdia and Fergana to the north, Parthia to the west, and Kabul and the Indus Valley to the south. Soon after 190 BCE, Demetrius extended Greek interests into northern India, forging a link between the Hellenistic and Indian cultures that was strengthened under his successors Eucratides and Menander.

As well as establishing a link between Hellenic and Indian culture, the most significant artistic legacy of the Greco-Bactrians is their superb coinage, which was issued in silver and bronze. The royal portraits are masterpieces of coin engraving; facial features are

so realistically and individually realized as to surpass even the Seleucids. Euthydemus is depicted with a thick neck, full cheeks and chin, and a determined mouth; Eucratides wears a helmet with bull's horns above his naked torso; Demetrius wears an elephant-scalp headdress and formidable expression; and Antimachus has unique facial features reflecting his mixed Greek and Sogdian blood. The coins strongly influenced the subsequent issues of the Kushans, under whom Central Asian art reached the heights of syncretistic achievement.

The Kushans: Gandharan and Mathuran Art

The invasion of Bactria by the Yuezhi confederation in 130 BCE ushered in a period often described as the Golden Age of ancient Central Asia. By around 45 CE the Yuezhi had transformed themselves into the imperial Kushans, and for much of the subsequent two centuries the stability of their regime facilitated astonishing levels of trans-Eurasian cultural exchange along the various Silk Roads, which linked the Mediterranean, Parthian, Indian, Chinese, and steppe-nomadic worlds into a single world system for the first time in history. Central Asian art was transformed by this interaction, and although a number

of distinctive Kushan styles are known, the most significant are those that emerged at Gandhara and Mathura.

Gandhara (located near Peshawar in Pakistan) had been incorporated into the Greco-Bactrian kingdom, and the art that evolved there owed much to Mediterranean, Indian, and local traditions. Gandharan sculpture (along with Kushan coinage) has long been associated with the earliest depictions of the Buddha, who had previously been represented only by symbols such as footprints or an umbrella. In an attempt to express for the first time the idea of his divinity in human form, Gandharan sculptors (who worked in hard, gray schist) turned to statues of Greek and Roman gods. The earliest Buddhas feature drapery that hangs in loose folds but still outlines the form and movement of the body beneath. Many are similar to the contemporary statues of deified Roman emperors, and the head recalls the Greek god Apollo. Also remarkable in Gandharan art are flat sculptures worked on slabs of schist (often used as

stair-riser reliefs) depicting both religious and secular scenes. These pieces abound in details from everyday life—comfortable beds, food and wine, dancers and musicians, and realistic portraiture—and their extraordinary mixture of Indian symbolism, Romano-Hellenistic architectural details, and steppe-nomadic costumes are a quintessential example of Central Asian artistic synthesis.

In later phases (Gandharan art continued until the sixth century CE) the remarkable blending of local,

The standing Buddha of Gandharan style, circa first-second century CE, features characteristic loose drapery revealing the form of the body underneath. Tokyo National Museum.

Eastern, and Western styles continues to be found in Buddhas and bodhisattvas that combine Greek symmetry with Indian sensual spirituality and serenity. In turn, these syncretistic images went on to profoundly influence later East Asian images of the Buddha, particularly the Chinese. So stylistically unmistakable is the sculpture of Gandhara that early-twentieth-century archaeologists were able to map the spread of Kushano-Gandharan influences to the eastern edge of the Tarim Basin, based primarily on the continuing Greek and Roman stylistic influences observed in Buddhist sculpture they had unearthed.

Mathuran artists (based on the Jamuna River, a tributary of the Ganges) worked mainly in white-spotted red sandstone and were clearly influenced by the Gandharan synthesis. Whether standing or seated, the Buddha is depicted with broad shoulders and a large chest, and with legs apart and feet firmly planted, conveying a sense of power and energy. Mathuran secular art is notable for its sensual depictions of women and also for a superb series of portraits of the Kushan kings. Particularly impressive is a low-relief (unfortunately headless) sculpture of Kanishka (reigned c. 129–152 CE) in which he is depicted with sword and mace, and with his feet planted in a masterful manner. The king wears nomadic dress, and although the work was undertaken in Mathura (the Kushan winter capital), the style and concept seem to stem more from a Scythic-Parthian tradition than an Indian one. However, the arts of both Gandhara and Mathura did contribute profoundly to the formation of the classic style of Indian art, which reached its maturity during the three-century-long Gupta period.

First Millennium of the Common Era

Following the death of the Kushan ruler Vasudeva around 228, the Kushans were rapidly replaced in

This fragment from the “Swimmers” wall fresco in Kizil, Cave of the Seafarers (c. 500 CE), was pillaged, like many other “portable” works, by nineteenth-century European archaeologists. Collection of the Museum of Asian Art, Berlin.

Central Asia by the Iranian Sasanians, who later established strong trade contacts with Tang-dynasty China (the Tang were in power from

618 to 907) that ensured the continuation of the tradition of artistic synthesis. Tang art—including flasks and pottery figurines—was clearly influenced by Central Asian and Western prototypes brought to China by pilgrims and traders. Mahayana Buddhism was by now firmly entrenched in Central Asia, and much of the art created during the first millennium CE was produced in monasteries across the Tarim Basin. Many of the more portable pieces were pillaged by European archaeologists in the nineteenth and twentieth centuries and now reside in institutions all over the globe. Notable are the superb wall frescoes produced around 500 to 800 at Kizil, which demonstrate Sasanian, Indian, and Chinese influences; Buddhist wall paintings from Kuqa (from around 900 to 1000) in west central Xinjiang and Uygur frescoes from Bezeklik and Sorcuk (both displaying Sogdian, Persian, and Indian influences); and the astonishing library of illustrated scrolls discovered by the archaeologist Aurel Stein in the Monastery of a Thousand Buddhas near Dunhuang in north central China. Included among the latter was the oldest block-printed book so far known, a copy of the Diamond Sutra dating from approximately 860 CE. Cultural and stylistic influences continued to move in both directions. The sculpture and painting produced in monasteries in Turpan in Xinjiang, for example, influenced the subsequent Buddhist art

of Tibet, while the funeral art of the Uygurs deeply affected Mongolian painting. Many superb examples of Manichaean art are also known throughout Central Asia, documenting the spread of the “religion of light” eastward from the Sasanian realm as far as the Tang capital of Xi’an.

Not all the art of Central Asia was so easily transportable. In the high Bamiyan valley in northern Afghanistan, at a crossroads of two Silk Roads routes, a large monastic complex was responsible for the carving of monumental figures of the Buddha. Until just prior to its destruction in 2001 by the Taliban

regime, the tallest of the colossal statues (52.5 meters) was the single largest Buddha known in the world. The Bamiyan Buddhas were massive reliefs set deep in the side of a cliff, inspired by the Indian rock-cut architecture of Ajanta in south central India. They were completed in a naturalistic, post-Gandharan style strongly influenced by both Parthian and local traditions, and in turn inspired the carving of another group of colossal Buddhas at Yungang in the Chinese province of Shanxi (northeastern China), completed late in the fifth century.

Modern Era

Outside of the scope of this brief outline is a consideration of the splendid cultural legacy of Islam that has been such a dominant influence upon Central Asian art from late in the first millennium CE until today. The textile arts of the region also deserve an essay to themselves, particularly as the great trade routes were named after silk. Textiles are of paramount importance to world historians because of the role they have played as mediums of exchange and as indicators of social position, ethnicity, and religion. Textiles were used as currency, to pay taxes, and as symbols of imperial patronage, and yet the fragile nature of the medium has meant that only a fraction of those produced have survived. One of the largest collections of ancient Central Asian textiles so far discovered are those associated with the desiccated mummies found at sites all over Xinjiang, analysis of which has been tentatively used to suggest a historical connection between the Tarim Basin mummies and the Bronze Age migration of Indo-European-speaking migrants into the region.

The richness of color, pattern, and texture that so distinguishes the region’s textiles is a product of the intense transfer and blending of ideas, motifs, techniques, and materials between nomadic and sedentary peoples, a tradition that continues in the twenty-first century. In the contemporary nations of post-Soviet Central Asia, weavers, potters, ceramic masters, jewelers, and painters from both

Thus shall ye think of all this fleeting world: A star at dawn, a bubble in a stream, A flash of lightning in a summer cloud, A flickering lamp, a phantom, and a dream. • **Diamond Sutra (868 BCE)**

A Tarim Basin mummy photographed by the archaeologist Aurel Stein circa 1910.

sedentary and seminomadic traditions continue to practice their art. But the Soviet policy of forcing artists and craftspeople to work in collective factories and prohibiting the production of individual work had a devastating effect on many of the traditional arts of Uzbekistan, Turkmenistan, Kyrgyzstan, and Tajikistan. In some cases, archaeologists of the era also destroyed later layers of artistic artifacts in the process of excavating older periods. As a result, the few masters who remain in the region today carry a precious living legacy of tradition and technique.

Since the Central Asian republics gained independence in the 1990s, nongovernmental organizations such as UNESCO have played an important role in the renaissance of traditional arts and crafts through grants to artists and assistance in the international marketing of their works. One result of this well-intentioned strategy has been that many artists now concentrate on producing commercial works for foreign buyers as they adjust to market realities, and the creative process, particularly in terms of original modern art, has suffered. Of course, Central Asia has always been a region characterized by the tensions between local ethnic traditions on the one hand and a diverse range of foreign influences on the other, as a result of its geographical location as a hub for trans-Eurasian cultural exchange. It remains to be seen how Central Asian artists of the twenty-first century will balance the seemingly opposing forces of tradition and foreign influence, although it has been this very dynamic that for over five thousand years has resulted in the production of some of the most profoundly influential art in world history.

Art—China

The breathtaking scope of Chinese art—highly decorated Bronze Age vessels, exquisitely executed calligraphy, monumental Buddhas carved from rock cliffs, landscape paintings brushed in ink on silk scrolls, the Socialist Realism of the Mao years, and even the fireworks display at the 2008 Beijing Olympics (designed by a renowned Chinese artist)—comprise a remarkable several-millennia-old body of Chinese art that developed both in response to, and isolated from, other cultures.

Chinese art, as part of China's culture, can claim to be one of the world's oldest and continuous traditions—existing in relative isolation at times, at other times heavily influenced by outside elements. It deserves respect for extraordinary achievements, especially in calligraphy and pictorial art, and for a more than one-thousand-year-old tradition of landscape painting, through which Chinese painters have used art to come to terms with human life and nature. Although Chinese artists in the twenty-first century have absorbed Western ideas, many still continue to draw upon their tradition.

Pre-Imperial Era: circa 3000–221 BCE

The origins of Chinese art date to the third millennium BCE with the emergence of settled

agricultural communities, mainly in the North China plain. Since early in the twentieth century archeologists have unearthed many pieces of finely built, wedged and coiled ceramic pottery in a variety of regional, cultural styles. Early artisans embellished their bowls and flasks with brushwork in abstract designs or with depictions of fish and other creatures. This tension between stylized and more naturalistic representations remains an enduring feature of Chinese art throughout history, from the Neolithic period on.

With the emergence of cities and dynasties by the second millennium BCE (Shang dynasty, 1766–1045 BCE; Zhou dynasty, 1045–256 BCE), a highly stratified society appeared in which the royal house and nobility patronized artisans who produced luxury goods, some for personal consumption and many for ceremonial purposes, especially rituals having to do with the emerging cult of the ancestors. Tombs from the period are full of items—jade, ivory, and lacquer objects; gold and silver ornaments; and bronze eating and drinking vessels in particular—made by highly

skilled craftspeople to serve the deceased in the afterworld (and perhaps to appease vengeful spirits who might harm the living). During the Shang dynasty large-scale human and animal sacrifices were included in these burial treasure troves, but under the influence of Confucian humanism by the late first millennium BCE, this practice was replaced by the use of substitute figures (*ming qi*) fashioned in clay, metal, or wood.

The utilitarian but highly decorated bronze vessels, the most admired and studied of these artifacts, signified the wealth and power of the families who owned (and were buried with) them. The vessels evolved in a basic repertoire of about thirty shapes, with the three-legged bowl (*ding*) being the favored form. Some vessels were very large, weighing over 100 kilograms (about 225 pounds); some derived from earlier pottery forms; others were sculptural and took the shape of composite animals. The artistry and technical virtuosity that went into these ritual bronzes has seldom been equaled and never surpassed in bronze casting anywhere. The outside surfaces were highly decorated with rigid bands of semi-abstract relief sculpture—some suggesting feathers and scroll patterns, and others depicting birds, dragons, animals, and mythical figures, many of which reflect Shang attitudes to the supernatural world. Most famous is the “monster face” (*taotie*), a mask-like, double-profile motif with eyes and curlicue brows but no lower jaw.

The image evokes the shaman’s costumed face in pre-Confucian religion; even in the twenty-first century shamans wear animal skins that are missing the lower jaw.

The ceremonial and burial use of bronzes continued throughout this period but by the late Zhou, especially after 600 BCE, styles reflected changes in Chinese society and culture. Warring states and disunity brought social unrest; the era of China’s great

philosophers—Confucius, the legendary Laozi, and Mozi—arose. Thus the intricate scroll patterns and monster faces of earlier times lost the energy and mystery of the old shaman rituals. Bronze vessels still used in burial sites were adorned with a looser, decorative elegance, and they have become treasured collector’s items in the twenty-first century.

Early Imperial China: 221 BCE–220 CE

Archaeological finds, mainly from tombs, remain the best source for studying the development of art in the era beginning with the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties. The most spectacular find in recent years was the huge, 2,200-year-old army of terracotta soldiers buried to guard the tomb of the Qin emperor Shi Huangdi, the “First Emperor” to unify China. In 1974, a farmer digging a well near the modern city of Xi’an stumbled upon some of these slightly larger-than-life-sized statues. Subsequent excavations showed not only the highly developed skill in clay sculpture of the time but amazingly realistic detail and individual facial features.

This realism also appears in miniature clay figures, notably of dancers and entertainers,

found in less grandiose tombs from the Han period. Han funerary traditions also included burying clay models of houses, some with realistic details such as penned enclosures for pigs and hutches for chickens. A scene depicting two crows perched on the branches of a tree, part of the decorative embellishments painted on the exterior walls of such a model (now at the Nelson-Atkins Museum of Art in Kansas

Flying horse from Wuwei, Gansu Province. Eastern Han dynasty (25–220 CE). This sculpted bronze steed suggests mythically divine qualities attributed to the horse. Photo by Joan Lebold Cohen.

City, Missouri) is a precursor to tenth-century flower and bird painting—the first extant example, in fact, of what would become in the tenth century an important and independent genre in Chinese art.

More luxurious tomb items forged from precious and semiprecious metals (gold and silver as well as bronze) further attest to the high skill of workmanship and the tendency toward realistic representation. A highly detailed bronze—a miniature horse and chariot, complete with driver, umbrella, and reins, which was found in Gansu Province along the ancient Silk Roads route—is very different from the massive, symbolically decorated bronze vessels of the previous era. Even more striking is the bronze “Flying Horse of Gansu,” in which the horse, depicted in full gallop, is poised on just one hoof. Here, spirit as well as naturalism animates the creation of this long-dead anonymous sculptor.

Archaeologists have uncovered an example of one of China’s unique contributions to world art and commerce—silk fabric art—in a burial site at Mawangdui, on the outskirts of present-day Changsha. Bog-like conditions helped preserved artifacts in the tomb of the Marquise of Dai (Lady Dai), including the noblewoman’s clothing and body (found in a semi-mummified state), and a large T-shaped silk banner. Painted scenes on the banner, dating to the second century BCE and now in the Hunan Provincial Museum, represent hierarchical levels of the cosmos—heaven, Earth, and underworld—and reflect the early Han belief in the close relationship between the human and supernatural worlds.

Departing from traditional views that interpret the banner based on three sections of equal proportion in the composition, Wu Hung (1992), in his study “Art in a Ritual Context: Rethinking Mawangdui,” sees the scene comprising four parts. Heaven, predictably occupying the top (i.e., the “crossbar” of the T), contains a sun (superimposed with the image of a crow) in the right corner, a crescent-shaped moon with a perching toad on the left, and the Han imagining of the Great Ancestor (a primordial deity depicted as a man with a serpent’s tail) in the middle. Among the constellations immediately below swarm dragons and fantastic

The T-shaped banner from Lady Dai’s tomb is covered with images that reflect the early Han belief in the close relationship between the human and supernatural worlds.

snakes. Positioned at the place where this horizontal heaven is connected to the T’s stem, two doorkeepers eagerly wait to admit Lady Dai. All the figures are painted energetically, in an almost cartoon-like

style, combining human and capricious animal forms floating in the ether.

In the two “earthly” sections below heaven, which occupy more than a third of the banner’s total space, Lady Dai prepares for entry to the afterlife—underneath a high ceiling that signifies the difficulty of entering heaven, and above the section where family members offer sacrifices to her. In the lowest and fourth part of the composition an underworld creature holds up the world like a Hercules. Coiling snake-like dragons enclose each of these four sections. At the dramatic center they crisscross threading through a circular jade *bi* disc (a symbol of heaven). The artist’s skill in organizing such a complex story in a series of space cells reveals an early mastery of a narrative form and an approach to image making that moves toward “realism.”

Painting and Calligraphy: 220–589 CE

Relics such as Lady Dai’s banner provide tantalizing glimpses not only into the society and belief system of the age but also into the early development of two-dimensional Chinese art—painting. The Chinese invention of paper and ink is of enormous significance to the world as papermaking techniques and brush writing also moved west along the Silk Roads. (At the same time outside influences, specifically Buddhism and its art, moved eastward along the same route.) Paper and the writing brush hugely influenced the development of China’s centralized bureaucratic form of government and the high culture of its literati class. Painting and calligraphy would develop in China as “high art” forms.

Abundant Chinese literary sources and histories state that the post-Han era—a period of disunity before the Sui dynasty began in 589 CE—was an important one for painting. But because works of art were destroyed in periods of social unrest and political upheaval, few paintings of the period survive. One of the most important that does, a silk handscroll called *Admonitions of the Instructress to the Ladies of the Palace* and attributed to Gu Kaishi (c. 344–c. 406), illustrates the already centuries-old Confucian view

of art as didactic and morally enriching; the narrative defines wifely virtues, filial piety, and rules for proper behavior. In one scene an empress resolutely places herself between her frightened emperor husband, his frantic courtiers, and a charging bear; in another, servants groom and dress royal children while their indulgent parents look on. The figures, outlined in even brushstrokes with only a few areas of color filled in, show detailed facial expressions, especially on the men. Handscrolls (this one some 3.5 meters (11 feet long), were meant for intimate viewing, with three or four people looking on as the person holding the scroll revealed small sections at a time.

For Daoists of the period, whose ancient traditions fostered connections to nature, art had spiritual value; thus landscape, later a major theme in Chinese painting, emerged as a subject. The quality of brushstrokes, as vehicles of expression and as the “bones” giving a work its primary structure, became the benchmark by which the Chinese judged a painting. This combination had already found its purest embodiment in calligraphy, a form of expressive handwriting in a variety of styles that would carry on pedigrees of famous scholars. Wang Xichi (c. 303–361 CE), one of the most renowned practitioners of his day, became the model for many later calligraphers and literati elite.

Buddhism and Chinese Art

The arrival of Buddhism, which started as a trickle of monks with sutras and images in the late Han dynasty and built to a flood by the sixth century CE, was the major foreign influence on Chinese art before the global reach of European culture and power in recent times. Buddhism, brought by Indian monks traders, entered China by two routes: maritime via the Indian Ocean and Southeast Asia, and overland by the Silk Roads into northwestern China, which was still the center of the empire. The visual stimuli initially arrived through illustrated scriptures and small portable images and shrines, but soon Chinese created their own larger Buddhist sculpture and mural painting.

Attributed to Gu Kaishi (c. 344–406), *Admonitions of the Instructress to the Ladies of the Palace* (detail). Scroll, ink on silk. In this scene nannies groom royal children as parents look on indulgently. Collection of the British Museum.

After the fall of the Han dynasty, the disintegration of central political authority, ensuing social chaos, and invasions from the north greatly facilitated the acceptance of this otherworldly religion in both the North China plain and the Yangzi (Chang) Valley; Buddhism offered consolation in life and the promise of salvation after death. The carving of huge caves and monumental statues from solid rock cliffs, an art form established in India, migrated with Buddhism to China and punctuated the landscape en route. (The huge standing statue of the Buddha in Afghanistan, destroyed in 2001 by the Taliban, is such an example.)

The rulers of the Northern Wei dynasty (386–535 CE), who made Buddhism a state religion in the large part of northern China they ruled, became important patrons of Buddhist sculpture. In the first Northern Wei capital at Datong (Shanxi Province), in the shadow of the Great Wall, they sponsored the construction of cave temples with large stone statues and brightly painted murals inspired by the Gandharian

style of northwestern India and Afghanistan, which itself had borrowed heavily from Greco-Roman sculpture. In the great cave complex at Yungang masterly images of the Buddha and his pantheon still exist; some, over thirty feet high, depict stories of his lives drawn from the *Jataka Tales*. Originally painted with gold and vivid colors on living rock, they now stand largely intact but weathered into a more austere, colorless appearance not unlike that of the once-painted classical architecture and statuary of ancient Greece.

Images of the Buddha (and the practices of Buddhism) changed as they traveled east. Already at Yungang, Chinese aesthetic and social values made their mark on the foreign religion and its art. Here the full bodied, curvaceous Indian Buddhist images assumed a newly sinicized form and were flattened and hidden under robes, according to Chinese Confucian propriety, to avoid any corporeal impropriety. When the Northern Wei emperor moved his capital south to Luoyang in 494 CE, a former co-capital with

Li Zhaodao (c. 675–730), *Emperor Ming Huang's Journey to Shu*. Colors and ink on silk. Although attributed to Li, the silk hanging scroll is almost certainly a Song-dynasty copy.

Xi'an, he decreed that evermore magnificent caves be carved out of the living rock at nearby Longmen Grottoes on the bank of the Yi River; they were also painted with scenes from the Buddha's lives. The stone at Longmen—a hard, closely grained, and dense limestone, quite different from the sandstone at Yungang—allowed for more detailed carving.

After the reunification of the Chinese Empire under the Sui (589–618 CE) and Tang (618–907 CE) dynasties, Chinese rulers continued imperial patronage by building additional cave temples at Longmen. (With more than 2,300 caves, and 100,000 statues and relief sculptures carved over a 250-year period, Longmen contains some of the finest examples of large-scale Buddhist carvings in China.) The style of Buddhist imagery was transformed again by a new wave of Indian influence, as the Buddha and his heavenly host had lost their stiff, disembodied poses and were refigured with softer, rounder, even sensuous bodies, sometimes in other materials such as wood and bronze.

Cave-temple paintings created from the fifth through the twelfth centuries, with their Indian and Central Asian inspirations, trace the evolution of Chinese religious painting over this long period. The largest and best preserved cover the walls and ceilings of 492 caves at the Mogao complex (at the oasis of Dunhuang in the Gobi Desert in Gansu Province). Many murals feature radiant polychrome frontal images of a

seated Buddha with his huge bejeweled pantheon hierarchically arranged in paradise. Others draw on the *Jataka Tales*, chronicling the former lives of the Buddha. An exotic motif used in these murals—and, in the context of Confucian morality, an erotic one—are the Flying Apsaras, heavenly (female) beings without wings who nevertheless soar through the sky wearing scanty Indian-style clothing and long diaphanous scarves that help them fly. Mural artists painted the Apsaras in deeply hued colors using some shading to suggest volume.

Two other aspects of these desert-air-preserved paintings deserve mention, not just for the subjects they address but for the backgrounds they place their subjects against. First, such paintings often show the Buddha seated in front of a Chinese-style palace, and these representations are the oldest visual record of Chinese palace-style architecture of wooden construction—more horizontal than vertical, with series of courtyards and distinctively upturned golden tile roofs. The form of architecture persisted, the surviving Qing Imperial Palace in Beijing being its latest reincarnation. Second, more relevant to the development of Chinese painting, Dunhuang paintings sometimes use natural scenery in the background. The color choice is noteworthy, especially in view of later Chinese landscape painting's general preference for monochrome ink or muted color. In the Tang period (618–907 CE), artists painted

mountains, valleys, and rivers in brilliant blue and green hues, a color pattern that would predominate as landscape painting, treating nature itself as the main subject, emerged in the late Tang and subsequent dynasties.

The most famous example of this use of blue and green mineral colors in a non-religious context is a silk hanging scroll, *Emperor Ming Huang's Journey to Shu*. Although the painting is attributed to Li Zhaodao (c. 675–730), it is almost certainly a Song dynasty copy. (Chinese reverence for the past made copying artworks a common practice, sometimes as forgery but more often to preserve valued cultural artifacts whose material substance, silk or paper, was prone to decay and disintegration.)

The painting recounts a famous incident in Tang dynasty history, the story of the emperor forced to flee from the capital when a rebel general, who'd had an illicit liaison with the emperor's favorite concubine, Yang Guifei, defeated imperial troops and seized the throne. Accompanying the emperor in exile is a procession of black-hatted courtiers riding through passes between three steep mountains. Women in wide, brimmed hats with veils move in single file along the narrow paths. In the glorious composition, with the picture plane tilted skyward to convey spatial depth, the verdant, pointy peaks poke through layers of clouds.

Emergence of Literati Art: Song–Yuan Period

Chinese society underwent profound changes in this so-called Middle Period of Chinese history. For art, the most important change consolidated social eminence and cultural hegemony with the emergence of the literati (*wen ren*). The term refers to those literate in the classical language who aspired to pass the imperial government's civil-service examination, a system of recruiting officials on merit rather than on family or political connections. Only a small minority of the millions of men who took these rigorous exams actually passed with a score high enough to win them a government post. (Women were not eligible

Fan Kuan (active c. 1023–1031), *Travelers by Streams and Mountains*. Fan's use of perspective in this 7-foot-long hanging scroll suggests humankind's small role in the universe.

to apply for court positions, and thus to take the exams, but they nevertheless studied classical language and parallel subjects in the Confucian spirit to make themselves more worthy to be chosen as wives and mothers.) As a consequence the large pool of male

Xia Gui (c. 1180–1230), *Twelve Views from a Thatched Hut* (detail). Handscroll, ink on silk. Just a few deft brushstrokes capture the details of the scene.

examination “failures” constituted a landowning rural gentry class that preserved largely Confucian values and imperial peace throughout the vast empire. Literati were profoundly “civil” rather than militaristic in their outlook, a sensibility reflected in the art they patronized and produced themselves. Although these trends started in the Han period and continued in the Tang, Confucian ideals of ruling through the pen (“writing brush” in China) were only fully realized in the Song period; there too they remained in dynamic tension with imperial power and the military might behind it.

Literati art is remarkable, almost unique in world history, because the individuals who produced it also consumed or patronized it. Most importantly it was, at least for a time, independent of court influence. The cultural prestige of these gentleman artists became part of their social status. Literati art forms were almost all “arts of the brush”—calligraphy, poetry, and ultimately painting.

During the tenth century a number of subsequently famous landscape masters began to treat “scenery” as more than a background to human activity. Landscape’s emergence as the most prestigious genre of painting, often linked to the veneration of nature in

Chinese Daoist philosophy, has also been correlated to the Confucian self-esteem of artists who expressed their own feelings rather than cater to the wishes of rich and powerful patrons. Many centuries would pass before anything comparable developed in Europe; thus some art historians acknowledge a precursor to “modernity” in Chinese painting by the end of this period.

The first half of the Song dynasty, noted for large hanging landscape scrolls, is also the earliest period from which survive a reasonable number of original works, although their subsequent prestige and market value has made forgery a thriving industry right down to the twenty-first century. One famous work from the eleventh century, *Travelers by Streams and Mountains* by Fan Kuan (active c. 1023–1031), now at the National Palace Museum, Taipei, Taiwan, is monumental in size (206.3 x 103.3 centimeters, almost seven feet high) and heroic in concept. The three planes of the painting, the smallest in the foreground giving way to immense scale and space beyond, illustrate a particularly Chinese expression of perspective. Inky, textured strokes in the bottom eighth of the picture depict a low-lying group of rocks. In the next section two tiny figures driving a mule team enter

from the right; craggy hillsides spanned by a bridge rise above them, on which leafy gnarled trees grow, their trunks outlined in black; a temple roof appears at the timber line of the hill on the right. In the third section, which fills nearly two-thirds of the scroll, a giant mountain looms, rendered with dry-brushed ink strokes pressed closely together to create the illusion of a towering monolith. A waterfall drops from a cleft in the mountain like a decorative ribbon and dances its rhythmic course over rocks at the mountain's base, which is partly obscured by mist. The scene embodies a kind of naturalism—one could imagine standing in this landscape and experiencing the feeling the artist so clearly conveys: the glory of nature within the universe and the small role that humans play in this celestial plan.

A number of talented artists of the period, such as Guo Xi (c.1020–1090) and Li Tang (c.1050–c.1130) practiced this new form of monumental realism in landscape painting. Emperor Huizong (r. 1101–1126) was a talented painter himself who led the Song dynasty academy. Perhaps his preoccupation with the arts was so intense that he neglected the threat to his empire when the Northern Jin state invaded his capital Bianliang (present-day Kaifeng). Some of the court fled south to Hangzhou, where his son established a temporary capital as the Southern Song (1127–1279).

The Southern Song emperor Gaozong (reigned 1127–1162) reestablished the academy in this milder clime. Living next to the beautiful West Lake surrounded by mountains, lush flora, and trailing mists, artists confronted a new imperial mood and a new way to convey an atmospheric landscape. Song rulers were no longer lords of the “Middle Kingdom,” as the Chinese named their country. They were a military failure in flight from the northern conquerors. Having lost their confidence as masters of their world they turned inward, living for the pleasures of the moment, day and night. Moreover, “form likeness,” what they called copying from nature, was considered an unworthy goal.

Southern Song paintings were smaller in concept and scale; handscrolls designed for intimate viewing

unwound with a cinematic effect, and album leaves (pages) provided yet a smaller scale. Artists no longer attempted to paint towering landscapes that conveyed the precise wonders of a scene; instead they focused on compositions that expressed a lyrical mood, something the art historian James Cahill, a Chinese specialist, calls “a blend of dream and reality.” Two outstanding academy artists, Ma Yuan (flourished c. 1190–c. 1225) and Xia Gui (c. 1180–1230) used simplified forms—contrasts of light and dark, and great expanses of blank space—to suggest a fleeting world captured only in glimpses. The extant portions of Xia Gui's *Twelve Views from a Thatched Hut* (handscroll, ink on silk, 28 centimeters [11 inches] high; 2.31 meters [about 7.5 feet] long) show subtly and perfectly modulated ink washes that evoke a landscape veiled in mist; just a few deft brushstrokes indicate details of the scene—grasses, trees, fisherman, and two bent-over human figures carrying heavy pails.

The “Ma-Xia one-cornered style,” an innovation named after these Southern Song masters, conveyed a sense of space by using asymmetrical compositions. Ma's *Viewing Plum Blossoms by Moonlight* (Metropolitan Museum of Art), a silk fan mounted on an album leaf, exemplifies this charmingly off-center configuration; an angular landscape of cliff and mountains occupies the space on the lower left, from which white-robed gentlemen gaze at plum branches reaching toward the moon—a small, pale circle counterbalanced and floating in the sense of limitless space on the upper right.

Although the Mongol conquest of China during the Yuan dynasty (1279–1368) devastated the Chinese in many respects, the arts continued to flourish. Many Song scholars refused to serve their new “barbarian” rulers and devoted themselves to literati pursuits of painting, poetry, and calligraphy. One such scholar, Ni Zan (1301–1374), who had grown up in effete luxury but then withdrew from official society, ignored the traditional spatial convention of near, middle, and far distances as they spanned from the bottom of the picture to the top. Scholars interpret Ni Zan's un-peopled compositions—with

Shen Zhou (1427–1509), *Watching the Mid-Autumn Moon*. Ink and colors on paper. Shen was the first to use the motif of a poet dominating the nature he observes instead of being dwarfed by it.

standard-issue trees, rocks and mountains—as an expression of the artist’s isolation from his foreign-occupied world, and a longing for a simpler time. James Cahill calls Ni Zan’s dry-brushed compositions “unimpassioned, subdued, and static.”

The range of landscape styles during the late Yuan dynasty increased as literati pursued and developed painting outside the influence of the court. Wang Meng (ca.1308–1385), another painter whose work conveys an aura of detachment, seemed to fill every square inch of silk with trees, rocks, streams, architecture, animals, and people. Fang Congyi (c.1301–c.1393) paints in a powerful, individual, and more emotional style, with inky trees and flowing ink lines. His hillside mushrooms up in a powerful explosion of black strokes to an umbrella crest of vegetation, while shadowy mountains rise in the distance.

The restoration of Chinese rule with the Ming dynasty (1368–1644) reinforced literati dominance of high Chinese culture, but such tastes did not totally predominate. The Ming saw a resurgence of popular culture and art with accelerating economic growth and urbanization; like Europe in this period, China too was developing a middle-class culture rather different from rural-based folk culture, itself given a boost by the availability of cheap, popular prints. (Most of the vernacular painting and printmaking for popular or middle-class consumption, however, has been lost.) Yet the history of the period remains associated with upper-class art and, as many art historians agree, that art is one of the most sophisticated traditions in global art history.

The Ming’s conscious attempt at summoning leading artists to court resulted in the group informally called the Ming Academy. These artists produced colorful bird-and-flower paintings in dramatically decorative styles as well as portraits, history, and genre paintings. At the same time the rise of amateur literati artists, who had gained recognition in the Southern Song and Yuan, became a more important part of Chinese art. Shen Zhou (1427–1509), a shining example of a literati painter born into a family of scholars-painters, learned many styles by copying. Thus with a mastery of ancient styles he created his own compositions—Shen was the first to use the motif of a poet dominating the nature he observes, not being dwarfed by it—and included poems in a finely wrought calligraphic hand to reinforce the painting’s meaning. In *Watching the Mid-Autumn Moon*, (ink and colors on paper, Museum of Fine Arts, Boston), the artist and his friends sit drinking wine in a grass shack across from an expanse of still water, while the harvest moon shines. His heart-felt poem extols enduring friendship and the evanescence of life.

Later in the Ming, Dong Qichang (1555–1636) dominated the scene as scholar-official, painter, and theorist. His view of Chinese art history divided painters into two schools: a northern (conservative) school dominated by professional painters whose often-decorative style emphasized technical skill (something he categorized as “sweet vulgarity”), and a southern (progressive) school whose painters aimed for free, expressive brushstrokes and the development of personal style. (Neither school depended on any

geographic significance.) Dong introduced ideas used to discuss calligraphy, such as “opening and closing,” and “rising and falling,” into dialogues about painting. He advocated learning from ancient masters before attempting to paint from nature, cautioning that the excellence of a painting should not be judged by how closely the work resembles nature, but by its evocative power.

Dong’s landscapes show deliberate dissonances in the relationship between foreground, middle ground,

and background; he effectively flattened space so that mountains, trees, and rocks functioned less as representational forms than as semi-abstractions. In *Autumn Mountains* Dong Qichang shows his innovative spirit by arranging his landscape arbitrarily; curving mountains hug the earth and trees march into the distance like soldiers at the painter’s command.

The Last Emperors: 1644–1911/12

The Manchu conquerors of China, who ruled as the Qing dynasty (1644–1911/12), went to great lengths to conciliate the Confucian literati class, and they became avid patrons of Chinese high culture. Eventually most Chinese scholar painters were reconciled to Manchu rule, but several “loyalist painters”—because of their creativity, but also perhaps due to their blood ties to the Ming, which appealed to modern Chinese nationalism—have been highly esteemed since the twentieth century. Two worthy of mention are Zhu Da (1626–1705) and Zhu Ruoji (1642–1707), better known by their respective assumed names, Bada Shanren and Shi Tao.

Zhu Da lived in luxury as a Ming prince until the age of eighteen, when the dynasty fell. He joined a Buddhist monastery where, according to some historians, he affected “crazy” behavior to escape Qing persecution. He took the name Bada Shanren (Dweller of Eight Great Mountains) and channeled his despair into painting flowers and birds (the latter usually rendered with angry expressions and only one leg), fish and other creatures, and simple landscapes with powerful inky black strokes that course across the paper in surprising directions. His work falls well within the Chan (Zen) Buddhist tradition of seeking essential truth within a tiny piece of nature. Shi Tao, another relative of the Ming, was only two when the Qing came to power. His principled eremitism earned the respect of Confucian literati and his emphasis on originality has made him an icon for modern Chinese ink painters. At times some of his landscapes approach abstraction; in one, an album leaf simply called *Landscape*, a monk sits in a small hut enveloped by heavily outlined, mountainous terrain dotted with

Lin Fengmian (1900–1991), *Portrait of a Woman Reading*. Chinese painters in the 1930s who stressed the realism rather than the abstraction of Western art got more support from the Nationalist government. Photo by Joan Lebold Cohen.

vegetation that seems, literally, to swallow him up. Dots, traditionally used to suggest diminutive vegetation on rocks, assume a much more dominant place in this composition; Shi Tao's use of them clearly influenced Wu Guanzhong (b. 1919), whose *Pine Spirit* (1984), with its links to abstract expressionism, still pays homage to Chinese tradition.

The Manchus, who had already adopted many Chinese practices before ruling as the Qing, continued to show respect for Chinese art that was based on the study of old styles and masters. Literati painting in the Qing thus became orthodox and stereotyped, especially as represented by the prestigious "Four Wangs" of the late seventeenth and early eighteenth centuries: Wang Shimin (1592–1680), Wang Jian (1598–1677), Wang Hui (1632–1717), and Wang Yuanqi (1642–1715). But painting was still infused with a current of individualism and the idea that the art represented the moral character of the artist. In

the eighteenth century a group known as the "Eight Eccentrics of Yangzhou," named for the prosperous commercial center in the lower Yangzi Valley where they worked, continued in this direction, appealing to the tastes of an audience beyond the court with figural subjects (and more flowers and birds) that were less ponderous and more commercially viable than landscapes.

Many have claimed that, after the trauma of Mongol Yuan, Chinese culture adopted an inward, "Great Wall" mentality. This is only partly true, although "foreign" Buddhist art, long since sinicized, had indeed lost much of its creative force. Systematic contact with maritime Europe started in the sixteenth century and had some influence on some aspects of Chinese art, largely through European prints brought by Jesuit missionaries; such traces can be found in portrait painting from the late 1600s onward, and in efforts at fixed-point perspective in early seventeenth-century landscapes. In general, literati artists regarded European painting as a curiosity rather than serious art, but Qing emperors were enamored of Western representational techniques and the effects of *chiaroscuro*. The Jesuit missionary Giuseppe Castiglione (1688–1766), who became a court painter for the Qing sometime after 1716 (under the Chinese name Lang Shining), worked to some extent with Chinese assistants to synthesize European methods and traditional Chinese media.

Chinese ceramics, however, made a very significant impact on the rest of the world, including Europe. China's long history of advanced ceramic technique culminated in the perfection of smooth white and green celadon in the Song and true porcelain in the Ming. Appreciated as an object d'art by both court and literati, porcelain was nevertheless a tradesman art. There were famous kilns, like Jingdezhen in Jiangxi Province under imperial control, but no famous potters. Porcelain was a major Chinese contribution to world trade and world culture, but in China it was not an art form in which a gentleman could express his command of high culture.

Art historians have generally regarded the nineteenth century in Chinese art as a period of stasis, if

not decline, but this characterization may be oversimplified. The cultural changes that slowly began to influence Chinese artists at the end of the Qing dynasty can best be understood by reviewing the dark period that began with foreign invasions and civil wars in the mid-nineteenth century. After Britain's victory in the First Opium War of 1839–1842 (a second war would follow from 1856 to 1860), the defeated Chinese conceded five treaty ports where foreigners could live and trade. The opening of treaty ports brought new visions of the world through books, magazines, technologies, and materials. Photography and various printing techniques, including Japanese-style woodblock printing, all of which were quite different from methods previously practiced in China, helped to disseminate new views.

In 1864, after the Taiping Rebellion, a prolonged and devastating civil war conducted under the ominous presence of Western troops, Qing imperial forces finally triumphed over peasant forces. Chinese felt increasing pressure after the French conquest of neighboring Vietnam and when Japan defeated China in 1895. The final blow came in 1900 when legions of foreign soldiers defeated the imperial troops in the Boxer Rebellion. At the same time many intellectuals did indeed find nineteenth-century ink painting on silk and paper stagnant. Paintings of idealized mountain landscapes, thought to be without energy and originality, had little relationship to the multiple realities of China—from the increasingly international cities to the decreasingly pristine countryside. But the changes to Chinese traditional painting were subtle in the beginning, introduced one small step at a time. In the second half of the century, a resurgence of calligraphic styles that had been used in ancient “metal and stone” inscriptions revitalized painting in the modern urban center of Shanghai, where the grand literati genre of landscape painting was eclipsed by new vigor in flower-and-bird and some figure painting. It is by no means clear that Chinese art had lost all its creative vitality. In particular, the “Four Rens” in Shanghai (Ren Bonian, Ren Xiong, Ren Yu, and Ren Xun) looked both backward to the grand tradition of ink

Huang Binhong, landscape painting (1982). Even after the end of imperial China, landscape painting continued to develop as artists expressed the new and engaged the old. Photo by Joan Lebold Cohen.

painting and forward to the challenges posed by the coming of the West.

Post-Imperial, Modern China

The movement of reform in Chinese art, connected to the introduction of modern science in China, started before the end of the Qing dynasty with the emergence of the first Western-style schools and the inclusion of Western-style drawing as part of the curriculum. After the establishment of the Republic of China in 1912, a weak government prevented the state from leading this educational reform effectively, although the Minister of Education, Cai Yuanpei, considered art to be an essential part of modern culture and spiritual values. But within several years Liu Haisu (1896–1994), a precocious teenager who would go on to be a leading oil painter and art educator in the

Qi Baishi (1864–1957). A painting of fish and crabs. Qi favored mundane subjects ignored by the elite.
Photo by Joan Lebold Cohen.

Republican era, founded the first private art school in Shanghai. By the 1920s a number of art schools appeared in other major cities such as Guangzhou (Canton) and Beijing, with young artists who had studied in Europe or Japan taking the lead in teaching the new Western art—oil painting, sculpture, design—to an iconoclastic generation eager to rejuvenate Chinese culture.

Their efforts remained a very small part of total Chinese art, confined to major cities and with more effective state support after the establishment of the Nationalist (Guomindang) government in Nanjing in 1927. The next ten years were the most productive period for introducing Western art, both formal academic styles (as represented by the L'Ecole des Beaux Arts-trained oil painter Xu Beihong at the new National University in Nanjing), and by more modernist painters such as Lin Fengmian in Hangzhou and

Pang Xunqin in Shanghai. All Western styles were, of course, new and “modern” to China. But there was a sharp difference between two factions: on one side the putative avant-garde who saw the latest styles of Western modernism—post-Impressionism, Expressionism, Surrealism—as the shock treatment needed to stimulate a progressive modern consciousness in China; and on the other side, those who stressed the scientific realism of more conventional Western art as the key to building national strength. The latter would eventually get more support from the Nationalist government and their Communist successors.

Ink painters remained far more numerous and claimed a far larger share of a growing urban art market. Many clung to tradition but others tried to use modern innovations such as galleries and exhibitions to keep the tradition alive and develop it further. Two of the most famous landscape artists, Huang Binhong (1864–1955) and Zhang Daqian (1899–1983), both called on ink painters to be inventive and display a new energy within the old parameters. Huang explored a deeper level of intensity in black ink; Zhang used color with inventive boldness, especially after he toured the Mogao caves in Dunhuang during the 1940s. There he copied the Buddhist cave murals, using the past as inspiration to rejuvenate the present.

Probably the most famous twentieth century artist, however, was the carpenter-turned-literati-painter Qi Baishi. He reinvigorated the literati tradition by painting humble subjects—garden vegetables, fish, shrimp, and baskets—often with splashes of brilliant color. But his calligraphy, poetic inscriptions, and seal carving (an artist’s insignia stamped on a painting) were all continuations of that cultural milieu—and his venerable appearance fit the role perfectly. He was lionized in both the Nationalist and Communist eras.

The Japanese invasion in 1937 politicized much of Chinese art, but this trend was apparent even earlier in the left-wing woodcut movement supported by modern China’s most famous writer, Lu Xun. The woodcut print was an old medium in China but new movement—its strong and distorted styles inspired by Western artists such as the German Expressionist

Dong Xiwen, *Founding of the Nation* (1954). Oil on canvas. This iconic example of Chinese Socialist Realism depicts Mao on the balcony of Tiananmen Square on 1 October 1949.

Kathe Kollowitz and modernist Russian print makers—introduced themes of social criticism and patriotic resistance against the Japanese. During the War Against Japan (1937–1945) many of these young artists joined the Communist Party in its rural base in the far northwest and shifted their artistic focus to appeal more to peasant tastes. This trend foreshadowed the fate of most Western modernist styles under the People's Republic. Art, in Mao Zedong's words, must “serve the people.”

“Serving the people” meant that art and artists had to follow the revolutionary agenda of the Communist Party in a prescribed style called Socialist Realism, a term borrowed from Stalin's Soviet Union. Perhaps the most iconic example of the style was Dong Xiwen's (1914–1973) *Founding of the Nation* (1954), which depicts Mao atop the balcony of Tiananmen Square on 1 October 1949 as he announced the establishment of the People's Republic. The dramatically arranged composition, with the new leadership lined up at Mao's side, inferred infinite control and a great future. The Communist Party distributed reproductions of the painting as a form of propaganda over a period of years, but the copies (and the painting itself)

had to be doctored several times as figures present on that historic occasion disappeared when they were removed from power.

Traditional ink painting, linked to feudalism, was condemned as part of the old society in 1949. Not surprisingly, many ink painters fought passionately to restore its status, and it resonated with Chinese cultural nationalism especially after the split with the Soviet Union in 1960. The new compositions retained the Socialist Realist formulae but used ink and watercolor as the media. In one prominent example of this “new red wine in old Chinese bottles,” the talented revolutionary woodcut-artist-turned-ink-painter, Shi Lu (1919–1982), created *Fighting in Northern Shaanxi* (1959) in a reprogrammed ink and watercolor style. A small but empathic figure of Mao stands triumphantly peering over the steep drop of rocky mountain dramatically bathed in a revolutionary red-washed landscape.

The politicization of art reached its peak during the Cultural Revolution (1966–1976), the last ten years of Mao's life. For instance, Dong Xiwen had to paint the disgraced president of the People's Republic, Liu Shaoqi, out of *Founding of the Nation*, and Shi Lu was

Liu Haisu (1896–1994), a leading oil painter and art educator in the Republican era, founded the first private art school in Shanghai. Photo by Joan Lebold Cohen.

denounced for making Chairman Mao so small in his *Fighting in Northern Shaanxi*.

For a time Cultural Revolution populism demanded that art be for and by the people, with famous artists denounced either for reactionary feudal thought, bourgeois influences, or both. But by the end of the Cultural Revolution and the beginning of Deng Xiaoping's reform policies both traditional ink painting and less political art came back in all fields.

The first somewhat premature assault on Socialist Realism as a style and doctrine came from a group of young artists in Beijing who took the name "Star Stars." In late September 1979, they created works in previously taboo modernist styles with even more

taboo political and sexual content. They hung an unauthorized exhibition outside the National Art Gallery for two days before police removed it.

Though temporarily stalled, the new generation of artists' impulse to explore modern Western styles could no longer be held back as China opened to the world economically and culturally. By the mid-1980s a "New Art Tide" (*xin meishu chao*) was rising, particularly among students at the state's most prestigious art academies. It crested and broke with a privately sponsored exhibition, "China Avant-Garde," at the National art Gallery in 1989.

This large-scale exhibition drawing younger artists from all over China featured Western-inspired art forms—conceptual art, installation art, mixed media, performance art—as well as all manner of twentieth-century Western modernist styles in painting and sculpture. *Dialog* epitomized the confrontational nature of performance art and prompted authorities to close the show. *Dialog's* two young artists fired pistol shots into a pair of telephone booths they had set up with dummies of a woman and a man connected in their telephone conversation. Five months later the avant-garde's dialog with authorities broke down completely when the more lethal gunfire in Tiananmen Square marked the crushing of the student-led democracy movement.

Democracy may have been stopped in Tiananmen, but new art was not as China became increasingly integrated with the rest of the world at the end of the twentieth century. The 1990s saw the rise of genres popular with foreign buyers, such as "Cynical Realism" and "Political Pop," which turned some younger artists into market superstars. Several who combine painting with installation and/or performance art have become international art celebrities with critical acclaim and exhibitions in the West and subsequent fame in China, especially Gu Wenda and Xu Bing, who both have lived in the United States for long periods. Their deconstruction of the Chinese written language by producing meaningless Chinese characters, either calligraphically or by woodblock printing, has struck a responsive postmodernist cord in the West for toying with the pillars of the

There is in fact no such thing as art for art's sake, art that stands above classes, art that is detached from or independent of politics. Proletarian literature and art are part of the whole proletarian revolutionary cause. • **Mao Zedong (1893–1976)**

established culture, suggesting its impotence and irrelevance. Another émigré, Cai Guo-Qiang, has become famous for his exploitation of gunpowder, another Chinese discovery, in large-scale pyrotechnic displays. He orchestrated the fireworks for the 2008 Beijing Olympics.

The speed of this leap from domestic to global in the early years of the new millennium is an affirmation of China's creativity and innovation. Even if belated, this recognition in the art world has been welcomed by the Chinese, as they achieve a difficult feat: to create new art that is both international and Chinese.

Art—East Asian and European Connections

East Asian and European art intersected around 100 CE, when trade brought Chinese silk to Roman weavers. From 1200 to 1500, Europeans imported Chinese porcelains and founded potteries to create Chinoiserie ceramics. In the 1800s, European artists developed Japonisme, a style mixing Japanese woodblock print and European imagery. The West's further focus on traditional East Asian art and religion during the twentieth century influenced modern Western art.

By the first century CE, imperial Rome was connected to China by a tenuous filament of silk that stretched more than 11,000 kilometers from Luoyang, the capital of the Han dynasty (206 BCE–220 CE), to Rome. Roman weavers, lacking the coveted silkworm, depended on the import of Chinese raw materials to produce the luxury fabric Roman high society so craved. The enormous distances between the two cultural centers inhibited the flow of bulky goods, however, and though the exchange of commodities, medicinal herbs, gemstones, and gold for silk thread flourished, Chinese art had little influence on the arts of Rome or the lands in between.

By the ninth century CE, heavier items, such as Chinese porcelain, were traveling west along maritime trade routes. The Arab traveler Ibn Battuta (1304–1368/69) remarked on the “green pots” shipped from southern China’s ports to the homes of affluent merchants on Africa’s east coast. Ibn Battuta’s description perfectly characterized the gray to yellow-green ware known in later years in the West as celadon. Known simply as *qingci* (green ware) in China, this

ancient ceramic was perfected in the third and fourth centuries CE. As the backbone of the Chinese porcelain industry, *qingci* was mass-produced in such huge numbers that the Venetian traveler Marco Polo (1254–1324) marveled over ordinary Chinese eating rice from *porcella* bowls—that is, dishes with the hard, lustrous surface of a cowrie shell (*porcella*). In Europe, celadon’s exquisite finish and elusive color promoted this fine ceramic from dinner table to a place of honor in the curio cabinet. Interestingly, these cherished imports were often modified to suit European taste in ways that would have shocked their Chinese makers. Thus, a bowl of “grene pursselyne,” reportedly given by the British archbishop of Canterbury William Warham (c. 1504–1532) to New College, Oxford University, was set in silver gilt, signifying its acceptance as an objet d’art fit for display with similar ceramics that had also been privileged with grandiose mounts.

In Asia, fine ceramics for everyday use were the stock-in-trade of massive export programs; as many as forty thousand pieces of various sorts have been recovered from a single shipwreck. Although choice examples may have graced an imperial table as testimony to wealth and good taste, ceramics retained a functional character in Asia until the late nineteenth century, when the collapsing Qing dynasty cut off the flow of patronage that supported the manufacture of the finest wares.

Chinese Blue and White

At the time of Marco Polo’s sojourn in Cathay between 1275 and 1292, the domain of the Mongol

ruler Khubilai Khan stretched from the Pacific Ocean to the Danube River, from the Himalaya to the Siberian forests. (Cathay, the Anglicized name for China, or Catai, gained currency in Europe when Marco Polo's journals were published.) The Mongol Empire encompassed within its boundaries Beijing, Samarqand, Karakorum, Moscow, all of Korea, parts of Southeast Asia, and Baghdad, the gem in the crown of Islam. This vast empire was one great trading zone where paper money (backed by precious metals and silk) facilitated the exchange of goods, none of which the Mongols made. A new kind of porcelain appeared during the reign of the Khans, one destined to become the most successful invention in ceramic history—Chinese blue and white porcelain.

The cobalt used to paint the vibrant blue designs on the white porcelain ground was originally imported from Persia (Iran). It may be that Persian merchants, residing in the port cities of southern China, were the original market for this ware; the enormous size of some early blue-and-white platters points to clients accustomed to eating off large, common plates, as the Persians did. Regardless, the demand for blue and white porcelain soon spread throughout the world, spawning speculation about the secret of its manufacture. Augustus the Strong (1670–1733), the elector of Saxony and king of Poland, sponsored Johann Friedrich Böttger (1682–1719) in experiments to produce porcelain, efforts that led to the establishment of the works at Meissen, Saxony, in 1710. European manufacture of porcelain did not interrupt the flow from China and Japan. The trade continued through the eighteenth century, with more than a million pieces entering northern Europe in 1774 alone.

Chinoiserie

Painted designs on Chinese porcelain provided an indirect model for the “Anglo-Chinese” gardens that were the rage in England in the early eighteenth century. The small pictures on the porcelain items

inspired actual European and American replicas: in England, the pagoda erected in Kew Gardens, the arched fretwork bridge at Hampton Court (now destroyed, but known through an engraving by the Venetian painter Canaletto), and the fretwork arms of a Chippendale chair; and in America, the fence Thomas Jefferson designed for the University of Virginia campus. Views of merchant houses painted on export porcelains were like illustrated postcards providing a glimpse of Chinese interiors and their furnishings. These miniature views, occasionally buttressed by the reports of travelers to Asia, provided the underpinning for the style known as Chinoiserie. The painter and designer François Boucher (1703–1770) was a master of that hybrid manner. Boucher's romantic *Chinese Fishing Party* (1741) melds Asian-looking actors with an ethereal French setting perfectly attuned to the tastes of his patrons, the French king Louis XV and the Marquise de Pompadour.

Chinoiserie does not exclusively depict Chinese subjects. Japanese themes were included in these Rococo fantasies, reflecting the long-standing trade in Japanese goods. By 1639, the Dutch were established at Deshima Island in Nagasaki Harbor, exporting the Arita and Imari porcelain, which Dutch factories sometimes imitated. Deshima remained the exclusive port of call for foreign trade and the only place where enterprising Japanese could gain knowledge of European art, science, and technology.

The arrival of the American admiral Matthew Calbraith Perry (1794–1858) and his sail- and steam-powered ships in Shimoda Harbor in 1853, followed by the successful negotiation of the Kanagawa and Shimoda treaties, guaranteed trade between Japan and the United States. Because of treaties like these, the world became one great trading zone connected by wind and steam, the telegraph, newspapers, and international expositions (really trade shows) advertising a nation's most-prized products. The Asian exhibits included various kinds of porcelain, svelte lacquer boxes, refined metalwork, wonderful fabrics,

The pagoda at London's Kew Gardens. In the nineteenth-century "Anglo-Chinese" gardens were all the rage.

and in some instances replicas of teahouses, gardens, and even miniature villages that gave life to the paper images sold to be viewed with the newly invented stereopticon. The citizens of the world were getting to know one another and to share their finest products as never before.

Japonisme

Japanese woodblock prints were sometimes part of the trade show inventory. Though not valued as fine art in Japan, the colorful pictures of actors, courtesans, and landscapes filtering into Europe had great appeal for artists such as Claude Monet (French; 1840–1926), who found in these prints

both inspiration and confirmation of his own efforts to forge a modern style. Monet covered his dining room wall with Japanese prints, built a Japanese garden with an arched wooden bridge, and posed his wife in a bright kimono against a background accented with Japanese fans. That picture, *La Japonaise: Madame Monet in Japanese Costume* (1876), was exhibited alongside other Japonisme-style works by Mary Cassatt (American; 1844–1926) and Paul Gauguin (French; 1848–1903). Some artists drew directly from the print sources. Gauguin incorporated a sketch of wrestling figures, copied from the Manga (Sketchbooks) of Hokusai (1760–1849), into his *Vision after the Sermon* (1888). Vincent van Gogh (Dutch; 1853–1890) made a close copy of

“Evening Shower at Atake and the Great Bridge,” number fifty-two in the print series *One Hundred Famous Views of Edo* (c. 1856–1858) by Hiroshige (1797–1858). *Nocturne in Black and Gold: The Falling Rocket* (c. 1875), by James McNeill Whistler (American; 1834–1903), is indebted to Hiroshige’s prints of the same subject.

The popularity of the prints among these artists was not solely because of their availability, flat color, lack of modeling, or the choice of unusual points of view. Part of their appeal was on the social level. Their treatment of “low-life” themes in Edo (present-day Tokyo) was in sympathy with depictions of the demimonde in Paris, such as those by Henri Toulouse-Lautrec (French; 1864–1901). The exotic sexuality of the Japanese prints in the *ukiyo-e* style (drawings of Edo’s “floating world,” or pleasure quarters) found a match in the eroticized novels of the French naval officer Louis-Marie-Julien Viaud (under the pseudonym Pierre Loti; 1850–1923) and the opera *Madame Butterfly* (1904), by the Italian composer Giacomo Puccini (1858–1924). And the fascination of the urban citizen of Edo with landscape was in harmony with the *plein air* (outdoor) movement in European painting.

Curiously, the earlier influence of Western art on these same Japanese printmakers is less well publicized. The most famous of all Japanese prints, Hokusai’s “In the Trough of the Great Wave at Kanagawa” (first in the series *Thirty-Six Views of Mt. Fuji*, c. 1827) was derived from earlier studies that Hokusai called the “Great Wave in the Western Manner.” And both Hokusai and Hiroshige designed prints illustrating one-point perspective, a Western technique. East and West, artists were looking at one another’s work for inspiration and guidance.

Influential Role of Museums

In the latter part of the nineteenth century, adventurous Westerners began to report directly from Asia. The American writer Lafcadio Hearn (1850–1904), fleeing Western materialism, published *Japan, An Attempt at Interpretation*. The Harvard-educated Ernest

Claude Monet, *La Japonaise: Madame Monet in Japanese Costume* (1876). Oil on canvas. Museum of Fine Arts, Boston. Monet, inspired by all things Japanese, also built a Japanese garden with an arched wooden bridge.

Fenollosa (1853–1908) received a professorship in philosophy at Tokyo Imperial Normal School (precursor of Tokyo University), where he lectured (with little effect) on the value of Japanese art, which was depreciated in its homeland in the rush toward all things Western. In this climate of fevered modernization, Fenollosa purchased treasures that became the core of the Japanese collections in the Museum of Fine Arts, Boston. In 1912, Fenollosa published his influential *Epochs of Chinese and Japanese Art*.

Sitting on the floor of a room in Japan, looking out on a small garden with flowers blooming and dragonflies hovering in space, I suddenly felt as if I had been too long above my boots. • **Mark Tobey (1890–1976)**

James McNeill Whistler, *Nocturne in Black and Gold: The Falling Rocket* (c. 1875). Oil on panel. Japanese printmakers, such as Hokusai and Hiroshige, influenced the work of nineteenth-century European and American painters.

The public museum emerged as the ultimate market for works of art by the end of the nineteenth century and the beginning of the twentieth. In 1923, the American financier Charles Lang Freer (1856–1919) established a self-named gallery of Asian art in Washington, D.C., the first art museum in the Smithsonian system. And in 1936, the Chinese government staged the first “blockbuster” exhibition of Chinese art at Burlington House in London, giving Western audiences an opportunity to sample the full range of Chinese art.

Influence of Asian Spiritual Systems

The collections of Asian art amassed in the great museums in Europe and North America encouraged the public to pick and choose between the various

arts of different cultures. The painter Mark Tobey (American; 1890–1976) worked in the Seattle Art Museum and became interested in Chinese calligraphy, resulting in his “white writing,” exhibited in New York in 1944. Tobey lived for a brief period in a temple on the outskirts of Kyoto, Japan. Morris Graves (American; 1910–2001), famous for his mystical “bird” paintings, visited East Asia several times between 1928 and 1930. Tobey and Graves both had an interest in Eastern religions, Tobey in Baha’i and Graves in Daoism and Zen Buddhism. Each would avow the influence of these spiritual systems on their works, though neither was imitating religious icons. What these artists sought was not just the form of Asian art but the essence of its spirit.

The master potter Bernard Leach (British; 1887–1979) was on the same spiritual quest. Together with Shoji Hamada (1894–1978), Leach brought Japanese ceramic practices, especially raku techniques, into the studio arts tradition. The rough-hewn ordinariness of raku ware and its spontaneous expressionism was the perfect complement to the intuitive experience essential to much mid-twentieth-century Action Painting and compatible with the spiritual intent of painters like Tobey and Graves. With the interest in raku came the tea aesthetic and an appreciation of Korean ceramics, celadon in particular, but also pieces displaying an accidental effect.

The influence of Asian art on Western painters that began with the Impressionists in Paris ended with artists like Tobey and Graves and the Abstract Expressionists, all of whom saw Asian art in the past tense. Van Gogh was copying thirty-year-old prints that were only available because they were devalued in Japan. The calligraphy admired by Tobey or the Zen-inspired painting that caught the attention of Graves and the painter and critic Roger Fry (English; 1866–1934) belonged to centuries-old traditions. The raku techniques introduced by Leach have had the most enduring effect, yet even this tradition is being challenged by a younger generation of studio potters. The Japanese-style gardens re-created in parks around the world echo old forms and not the new designs of the present generation in Japan. In

the twenty-first century, the ease of communication along the World Wide Web—the electronic counterpart to the Silk Roads—has internationalized local East Asian artistic traditions to the point that it is difficult to distinguish the art of one country from another. As Leach would have it, “All from West to furthest East are unitive and not dualistic” (Leach 1988, 9–10).

Art—Europe

European art evolved as the concept of “Europe” and its culture changed over time—from the beginning of early Christian-era iconography to the changes in visual expression influenced by shifting empires and tribal migrations. The Renaissance and its retro-focus on classical Greece and Rome brought emphasis from the divine to the individual, until, in the modern era, art needed no ulterior meaning or external reference.

The history of European art is related to the idea of Europe itself, an idea that has been in transition during the twenty-first century. Although the ever-evolving boundaries of modern Europe were not delineated until the nineteenth century, well before that people may have considered themselves “European,” and important artistic activity occurred on the European continent and the island land masses associated with it. The evolution of European art is characterized by the process of fusion and transmutation, much as the political entities of modern Europe developed from encounters between different migrating cultures. The proliferation of Christianity had an important impact on the development of a specifically European art and on its distinctiveness in world cultures, at least until the nineteenth century.

This article focuses on five historical periods: art of the early Christian era (c. 200–400 CE); art of the migrating tribes (400–800 CE); art during the Middle Ages (500–1400); art during the Renaissance and Baroque (1400–1800); and art of the so-called modern world (1800–2000). Although this discussion begins around the start of the common

era and is inextricably bound up with the rise and dissemination of Christianity, important art was produced on the European continent during the Paleolithic and Neolithic periods (cave paintings and sculpture in the former, sculpture and architecture in the latter).

Early Christian Art

The most significant achievement of the early Christian period was the forging of a new iconographic language that expressed the tenets of Christianity from a variety of Mediterranean antecedents: the Greco-Roman world, the Old Testament, and Egyptian art. Christians excelled at appropriation to communicate their message, and the visual tropes that were developed at that time persisted through the later periods of European Art.

Catacomb Painting and Early Christian Iconography

The first art that can be associated with Christianity and the vocabulary of Christian signs was created in the Roman catacombs around 270 CE, when Christianity was one among many cults within the Roman Empire. The catacombs were underground burial sites, used by many sects as well as by Christians; a network of chambers and compartments had been dug under Rome and particularly its outlying areas. Although they were not places of worship, their walls were often covered with imagery that marked the religious affiliation of the deceased.

The chamber devoted to Saint Peter and Saint Marcellinus in the Catacomb of Priscilla (fourth century

CE) provides a good example of how diverse sources were melded together to symbolize Christian resurrection. An image of the Good Shepherd, drawn from classical iconography, occupies the center of the ceiling. In a Christian context, this image represents Christ leading his flock to salvation. Images of salvation drawn from Hebrew scripture surround the central image, such as Jonah being spat out by the whale or Noah relaxing under a vine and fig tree after the flood. New Testament expressions of salvation through Christian sacraments such as the Baptism and the Eucharist (Last Supper) flank the central image of the Good Shepherd in a similar configuration in the Catacomb of Callixtus (second and third centuries CE). In one of the first depictions of the Virgin Mary and the Christ child, a woman nurses her child next to a haloed male figure, most likely Balaam, who points to a star over her head; the image, located in the chamber of the Velatio (veiled woman) in the Catacomb of Priscilla, draws upon Egyptian depictions of Isis suckling Horus.

Constantine, the Church, and the Empire

In 312, on the night before the battle of the Milvian Bridge, the Roman emperor Constantine allegedly dreamt of an insignia emblazoned with the entwined letters *chi* and *rho*, the first two letters of the word *Christ* in Greek, and the Latin phrase *in hoc signo vinces* (in this sign you will win). While carrying the sign of Christ into battle the following day, he defeated his rival Maxentius. Thus began a series of enactments whereby Christianity went from a persecuted cult to a state religion in a period of ten years. Constantine was a pivotal figure. He came to power as a Roman emperor, became the first Christian emperor, and ultimately was the first Byzantine emperor as well. The visual depictions that were formulated during his reign had an important impact on the development of European art for the next 1,500 years.

When Christianity became the state religion of Rome, the power of the empire was placed behind the church, thus stimulating the construction of large-

One of the earliest depictions of the Virgin and Child, from the Catacomb of Priscilla, draws upon Egyptian images of Isis suckling Horus.

scale buildings. Classical structures were transformed to fulfill the needs of Christian worship, with two architectural forms becoming dominant. The longitudinal form, derived from the Roman basilica but revised to be oriented from east to west along its vertical axis, became the format for the Eucharistic church, which was designed to hold masses of people: Saint Peter's, Saint John of the Lateran, and Saint Paul Outside the Walls. The centralized form, derived from baths and tombs, became associated with baptisteries and *martyria* (building dedicated to and containing the relics of martyrs).

The power of the empire was also reflected in the developing iconography, particularly as images of Christ portrayed as a Good Shepherd gave way to images with imperial connotations. The depiction of Christ as emperor first appears in Constantinian basilicas of the fourth century; a mosaic in the apse of Santa Pudenziana (390 CE), for example, shows him bearded and enthroned, surrounded by his apostles.

The nave of Saint Paul Outside the Walls (385 CE) also contains imperial imagery: the wall surface at the juncture between nave and apse is treated like a triumphal arch (c. 450 CE), with Christ—in an *imago clipeata* (framed portrait) at its apex—surrounded by the evangelist symbols, the twenty-four elders of the apocalypse, and images of Saint Peter and Saint Paul.

In 332 CE, to escape the disruption of intensifying tribal invasions, Constantine moved the seat of the empire to the ancient city of Byzantium on the Bosphorus, which resulted in the division of the Christian world into two empires, East and West. The Eastern Empire remained continuous from Constantine's era until the sack of Constantinople (now Istanbul) by the Ottoman Empire in 1456. Art forms became stabilized and persisted over those years as in a time capsule. The Western Empire went through a decline that took centuries to reverse. As Christianity moved from its Mediterranean base to outposts in northern Europe, the integration of diverse sources influenced artistic development.

Tribal Migration

In the age of migration a new imagery developed from the melding of northern tribal stylistic motifs with the Mediterranean structures that had become identified with Christianity. Indigenous northern styles were based upon a nonrepresentational visual vocabulary used in decorating portable secular objects. Often the size and complexity of the object reflected the status of its owner, as seen in the so-called Tara Brooch (c. 725 CE). A large ring brooch made from an assemblage of materials—its every surface, both front and back, is divided into sections teeming with complex, tightly entwined, boundary-pushing interlace. Even the slim vertical fastener is decorated, its finial a dragon's head with two bosses (button-like projections) for eyes.

The Book of Kells, a gospel manuscript—probably written and illustrated by monks on Scotland's island of Iona during the latter part of the eighth century CE, brought to the monastery in Kells, Ireland, in the late

ninth century, and described in the twelfth century by Giraldus Cambrensis as “the work of angels”—reveals a similar decorative concept applied to a Christian object. A richly decorated page, in which the first words of the text are embedded in a lavishly wrought design covering the entire surface, introduces each gospel. The *Chi Rho Iota* page (beginning the story of Christ's birth from the Book of Matthew) resembles a painted version of the Tara Brooch, in which the large forms of the first Greek letters of Christ's name (*XPI*, or *chri*) have been divided into sections, crammed with interlace, and visually “locked” to additional decorative motifs. A keen observer, however, notices human and animal forms hidden among the spirals and paisley-like shapes; a wonderful bit of realism appears in the lower left-hand side: two cats crouch, ready to attack a pair of mice about to seize a Eucharistic wafer.

The Book of Kells also incorporates classical elements. Borrowing from the late Roman practice of preceding texts with portraits of their authors, the manuscript includes portraits of each gospel author sitting under an elaborately decorated arch. The book contains early northern attempts at creating visual narrative, such as the page depicting the arrest of Christ. Finally, this manuscript also reveals a fusion with Egyptian sources, probably related to the eremitic monastic tradition. The image of the Virgin holding the Christ child emphasizes the tender connection of the pair, as seen in images of Isis suckling Horus, rather than the rigidity of the Hodegetria (literally, “she who shows the way”) frontal view, in which Virgin most often holds Jesus in her left arm and points toward him with her right hand, a pose ubiquitous in early Byzantine art.

Medieval Art, East and West

Two differing artistic traditions co-existed during the Middle Ages, corresponding to the division of the Roman Empire into East and West. Although they developed separately, there were occasional points of contact between them and they both exerted influences on the art of the following period.

Eastern

The major division in Byzantine art distinguishes works produced before the period of iconoclasm (early Byzantine art) and works produced after (middle and late Byzantine art). The emperor Justinian (527–565 CE) viewed himself as a second Constantine, and his reign is referred to as the “Golden Age” of Byzantine art. The court church of Justinian, the Hagia Sophia (537 CE, “Holy Wisdom”) in Constantinople, designed by Anthemius of Tralles and Isidorus of Miletus, brilliantly merges centralized and longitudinal architectural forms and embodies the aesthetics of this first period. According to Justinian’s court historian, Procopius, the vast, undulating space, its interior covered with gold mosaics and multicolored marble, seemed to radiate its own light. The dome, an engineering marvel supported on pendentives (spherical triangles) and punctuated by a ring of small windows, seemed to hover above the central space—in Procopius’ words, “as if suspended from the heavens by a golden chain.”

The period of iconoclasm (726–843 CE) involved a theological and cultural dispute concerning the nature of images, their veneration, and their relation to the godhead. Its resolution in the mid-ninth century resulted in a formula that remained operational until the mid-fifteenth century, when Constantinople was conquered by Islamic forces. The middle Byzantine church was built around a domed, centralized plan and was decorated with very restricted images arranged hierarchically. The highest areas were limited to images of Christ; the Virgin and child could be depicted in the apsidal area; the lower regions were limited to images relating to the liturgical feast days. This approach to decoration was prevalent not only in Constantinople, but in Greece, the Holy Land, and the Balkans.

During the latter period of Byzantine art, the image of the Virgin and child underwent an important transformation. Icons that used the older Hodgetria pose—in which the Virgin points to Christ as the way to salvation, continued to be produced—but the image of the “Madonna of Tenderness” served to express the intense emotional relationship between

mother and child and exerted an important influence on images that were later developed during the Italian Renaissance.

During the Middle Ages the Eastern and Western empires were parallel universes, for the most part separate, but with numerous points of contact and interpenetrations. For example, an Ottonian (Germanic) king married a Byzantine princess in the late tenth century, which resulted in the increased use of Byzantine artistic styles and motifs. After 1096, crusaders to the Holy Land encountered many examples of Byzantine artistic production, which they brought back to the West. (Unfortunately, they also conquered and occupied Constantinople for just over fifty years, from 1204 to 1261 CE.) The city of Venice was a crossroads between the West and the East, as seen in the Church of San Marco (1071 CE) with its five Byzantine-inspired domed compartments, each covered in golden mosaics.

Western

Art and learning in northern Europe from the ninth through the twelfth centuries were practiced in monastic centers that were often supported by temporal rulers. Beginning with the reign of Charlemagne (742–814; reigned as Frankish king 768–814 and as emperor of the West 800–814), who had himself declared Holy Roman Emperor in the tradition of Constantine and Justinian, there were several so-called *renascences*, periods where the body of knowledge and the artistic styles of the classical world were consciously reinterpreted as models for contemporary practice.

The major achievement of the Western Middle Ages was the development of large architectural forms, the Romanesque pilgrimage church and the Gothic cathedral. Writing in the middle of the eleventh century, the monk Raoul Glaber described how the world began to be covered with a “white mantle of churches” after the year 1000 when, contrary to popular expectation, it had not been destroyed during the second coming. Whether or not for millennial reasons, during the eleventh century, western Europeans began to consolidate

Innovative architectural advances allowed Chartres Cathedral to be suffused with light. The significance was metaphoric: divine light modulated on Earth was emphasized by stained-glass windows depicting both sacred and secular subjects.

and expand their knowledge of construction methods. By the thirteenth century, the Western cathedral had been developed, primarily in France but also in England, Germany, and Italy.

The cathedral dedicated to the Virgin Mary at Chartres, southwest of Paris, provides an excellent example of how cathedrals (literally, bishops' seats) were encyclopedic embodiments of human knowledge. In its architecture, Chartres illustrates the most important advances of the period: how to build a tall building with a stone vault, for which the flying buttress was developed as a means of transferring the load from the interior to the exterior of the building through the logical application of the bay system of

construction. This method allowed the building to be suffused with light, whose significance was metaphorical, the divine light modulated on Earth, emphasized by stained-glass windows that depict both sacred and secular subjects.

Monumental column statues—depicting nineteen of the twenty-two Old Testament figures said to be precursors of Christ—flank each of three portals, marking the passage from secular to sacred space; along with coordinated high-relief sculptures set into arches over the doorways, they communicate a message of salvation through Christ while at the same time evoking the unity of human history and knowledge. Chartres was a center of learning, and such classical concepts as the *trivium* and *quadrivium* (curricula including, respectively: grammar, rhetoric, and logic; astronomy, geometry, arithmetic, and music) are also expressed on its surface, as is the passage of human time through the depiction of the signs of the zodiac and the labors of the months. Thus the building reflects the cosmos, the establishment of the Heavenly City of Jerusalem on Earth.

Renaissance and Baroque Art

Although there had been several smaller rebirths of classical culture during the Middle Ages, the ultimate one took place during the period (formally) called the Renaissance, when learned people made a concerted attempt to copy and reinterpret Greco-Roman texts and images with greater authenticity. This movement was self-defining and it was centered in Italy, although it was experienced in other geographical locals. Two important artistic developments emerged during the Renaissance: an emphasis on the human rather than on the divine, and the ability to make illusionistic depictions of the real world. Whereas in the Middle Ages the church was the major patron, the Renaissance, in concert with the emphasis on the individual, fostered the rise of the wealthy, aristocratic patron.

There is a substantial overlap between the late Gothic and the Renaissance periods: the tendency to make images that reflected actual human interactions

can be seen as early as the twelfth and thirteenth centuries. Nonetheless, the Renaissance is characterized by a conceptual shift, where, following the ancient Roman architect Vitruvius, “man” became the measure of all things, although the cosmos was still given divine authorship. The painting by Masaccio (1401–c. 1427) of the *Expulsion from Paradise* for the Brancacci Chapel, Church of Santa Maria del Carmine (Florence, 1426 CE) provides a good example of this change in consciousness. Here, the first humans are shown in a state of utter desolation and abjection—Adam covers his face, Eve lets out a wail—as they are forced to walk the face of the Earth in punishment for their disobedience. During the next hundred years the tendency to create accurate and convincing images of the human body became progressively more important; by the early sixteenth century Michelangelo (1475–1564) described his process of sculpting as “liberating” the human form that was “hiding” in the stone.

Likewise, during the fifteenth century artists sought to create pictorial illusions, conceiving the picture surface as a “window,” a continuation of actual space. The ability to create illusionistic space was dependent on the mathematical discovery, by Brunelleschi (1377–1446) and Alberti (1404–1472), of single-point perspective, a method of accurately representing on a two-dimensional surface the spatial relationships of human vision, characterized by the convergence of parallel lines at a single vanishing point on the horizon. Although for many years artists had used an “empirical” perspective in which spatial relationships were approximated, mathematical single-point perspective was first employed in the early fifteenth century by artists such as Masaccio in his *Trinità* fresco (Florence, c. 1425).

Masaccio’s northern contemporaries, such as Jan van Eyck (1395–1441), were less interested in mathematical construction, but these artists excelled in using atmospheric perspective (the progressive graying and loss of detail at the horizon) to communicate the sense of deep space. By the next century both methods had become standard painting procedure. Works centered around the papal chambers in the

Vatican, such as Michelangelo’s paintings on the Sistine Chapel ceiling (1510) or Raphael’s on the walls of the Stanza della Signatura (1511), feature expansive vistas created through spatial illusionism.

The emphasis on verisimilitude that developed during the Renaissance remained a dominant artistic feature for the next four hundred years. During the Baroque period Caravaggio (1573–1610) used stark contrasts of light and dark to create intensely dramatic works, and Rembrandt (1606–1669) explored profound psychological states. Pictorial illusionism has become so normalized and naturalized that, even now, it is difficult to realize that those artistic criteria are relatively unique in human history, and that they are not the sole criteria of artistic skill and sophistication. Furthermore, a hierarchy of value developed in the post-Renaissance—Western “high art” tradition, where subjects drawn from history, myth, or the Bible were considered to be more “important” than others, such as landscapes, everyday scenes (“genre paintings”), or still life.

The Modern World

During the nineteenth century artists became interested in painting the actual without needing to imbue it with ulterior meaning. This lack of interest in ulterior meaning continued into the early twentieth century, when many artists also became interested in showing multiple perspectives, and culminated in an art that needed no external reference at all.

Nineteenth Century

Painting for its own sake was a goal of Impressionism, which began in France around 1870 and persisted for about twenty years. Like earlier nineteenth-century painters, the Impressionists were interested in depicting the specifics of the real world, but, pushing the envelope further, they attempted to make images that appeared to catch the transitory nature of perception.

The Impressionists took two basic approaches in their desire to capture the fleeting moment. The work

Mary Cassatt, *The Bath*. (1891–1892). Oil on canvas. By the 1890s Cassatt's compositions and color schemes showed a Japanese influence.

of Claude Monet (1840–1926), who was particularly interested in depicting the effects of light, exemplifies the first. In his *Impression: Sunrise* (1872), which gave its name to the movement when a journalist belittled the painting for its seeming lack of polish, or his *Sailboats at Argentueil* (1873), he used a broken brushstroke and patchily applied color to express the shimmer of light refracted in water. In the 1880s he began to paint in series, to observe the same scene at different times of day under different weather conditions, as in his many images of grain (or hay) stacks under the differing effects of sunrise, sunset, full sun, haze, rain, and snow. In the series depicting the water lilies in his garden at Giverny, on which he continued

to work until his death in 1926, the desire to capture the ephemeral nature of perceived light is carried to its extreme as all referential objects dissolve into fragments of color.

The other approach, practiced by more artists, sought to depict the vagaries of “modern life,” particularly the life of the modern city with its hustle and bustle of strangers in streets, cafés, and dance halls. Camille Pissarro (1830–1903) painted the boulevards of Paris seen from above, the traffic and people indicated by specks of paint. Edgar Degas (1834–1917) and Auguste Renoir (1841–1919) painted dancers caught in motion and people in cafés pausing in mid-drink. This way of seeing was particularly gendered, with women artists such as Mary Cassatt (1845–1926) and Berthe Morisot (1841–1895) concentrating on the interactions between women and children in their homes. The invention of photography in the first half of the nineteenth century influenced painters; Degas's image *Place de la Concorde: Vicomte Lepic* (1876), for instance, uses photographic compositional devices such as cropping. Degas and others were also aware of motion studies by photographers such as Eadweard Muybridge.

Japanese prints exerted another important influence on painters in both content and structure. With the opening up of Japan to the West in 1859, Western artists were introduced to the *ukiyo-e* (floating world) prints that presented images of ephemeral, daily human actions. Many painters sought to emulate the pictorial structure of Japanese woodcuts, which consisted of flattened planes and oblique entrances into the compositional space. Mary Cassatt was especially successful at capturing the effects of *japonisme* in her series of colored etchings achieved in the early 1890s, showing women going about their daily tasks, such as writing letters and bathing their children.

Early Twentieth Century

During the early twentieth century artists challenged the spatial system that had been devised during the Renaissance, seeking alternative approaches to representing three-dimensional space on a two-

Claude Monet, *Impression, Sunrise* (1873). Oil on canvas. The painting “gave” its name to the movement when a critic belittled Monet’s technique as lacking in polish.

dimensional surface. The interest in showing multiple perspectives can be related to scientific developments of the early twentieth century that emphasized the reality of phenomena not readily apparent to the naked eye.

Cubist artists wanted to create a picture surface that reflected the active experience of seeing, where the eye is not static but rather composes an image by integrating myriad simultaneously perceived points of view. (“Cubism” was a pejorative term given to the movement by critics who found it puzzling and disturbing.) Pablo Picasso (1881–1973), Georges Braque (1882–1963), and Juan Gris (1887–1927) were the first to develop works that used this technique; rather than paint a recognizable image of a guitar player, for instance, the artist would depict “facets”—fragments of the guitar’s strings, the player’s fingers, and smoke from his cigarette—which the viewer would need to piece together in order to read the image. The first phase, known as “analytic cubism,” is characterized by a greater use of faceting than in “synthetic” cubism, a slightly later phase,

where the multiplicity of the facets is resolved into overlapping planes, as in Picasso’s *Three Musicians* (1921).

The development of Cubism was important in that it integrated pictorial structure from non-European cultures with European modernism. In Picasso’s *Les Femmes d’Alger* (1906), for example, the face of the figure on the right looks very much like an African mask, with its abstracted features and multiple facets. By the early twentieth century, African art was being exhibited in European ethnological museums, where many artists responded to the abstract pictorial techniques of masks and other sculptures, as well as to their aura of mystery. Ironically, the structures were appropriated without a full understanding of the cultures from which they derived, and without consideration of the works’ meanings within those cultures.

The way of seeing that developed in Cubism was influential in numerous other twentieth-century artistic movements. Artists in both Italy and Russia used related techniques to communicate the

experience of physical motion. Umberto Boccioni (1882–1916) and the Futurists sought to communicate the experience of speed. Natalia Goncharova's (1881–1962) depiction of a bicyclist uses faceting to show the motion of the bicycle wheels and also the experience of the bicyclist as he sees the visual data of the world go by. Later, Goncharova and others attempted to depict moving rays of light, and other artists, such as Sonia Delaunay (1885–1979) and Robert Delaunay (1885–1941), also used faceting to communicate the simultaneity of vision, and to analyze light and its motion as well as the motion of the human eye. These latter artists began to make art that seemed increasingly more abstract, dependent less on perceived reality than on pictorial reality. Based on “pure plastic form” (the tensions that exist between colors and shapes and their placement on a pictorial surface), the work of art was conceived as sufficient to itself, needing no external reference, an extreme effect of the nineteenth-century turn away from content.

An interesting, and seemingly contradictory, extension of the development of artistic abstraction was the renewed desire to blur the boundaries between art and life. Many artists whose work was based on purely formal tensions sought to apply the same principles to the design of everyday objects. In Russia around the time of the Revolution (1917) artists such as Liubov Popova (1889–1924) wanted to make a “new art for a new age,” an art that was based on principles of abstraction but that had application in design—fabrics, dishes, book covers, and stage sets. Sonia Delaunay designed stage sets, fabrics, and even the furnishing of automobiles, commenting, “One day I make a painting, the next I make a dress—there's no difference.” An entire school dedicated to the universal application of design principles, the Bauhaus, was founded in Germany during the 1920s. Many artists associated with this project—its two founders Walter Gropius and Mies van der Rohe, as well as other members of the avant-garde such as Piet Mondrian—emigrated to the United States during the rise of Nazi Germany, effectively transplanting the International Style and European modernism to the United States.

Later Twentieth-Century Developments

Surrealism, which developed from Dada, was the major European art movement during the interwar years. Born in the cafés across Europe in the later years of World War I, especially the Café Voltaire in Zurich, Dada was a response to the perceived absurdity and destructiveness of the modern world, which its adherents believed called for a similarly irrational approach to art (both visual and literary). The name of the movement itself is ambiguous, possibly deriving from both the Russian word for “rocking horse” and the babbling sounds made by a baby learning to talk. Because it espoused “anti-art” Dada was not a movement per se, nonetheless works from such adherents as Marcel Duchamp became very influential in art of the later twentieth century. Duchamp was especially known for his “readymades,” in which he would take a “found object,” embellish it slightly or not, and then exhibit it as a work of art. Two such examples, both “made” in 1919, are *Fountain* (a urinal) and the cheap postcard-sized reproduction of Leonardo's iconic portrait of (Mona) Lisa Gherardini del Giocondo, on which he drew a moustache, a goatee, and the hand-printed title, “L.H.O.O.Q.” (The letters, if read quickly in French, phonetically approximate the phrase, *elle a chaud au cul*, which Duchamp translated colloquially to infer that Mona Lisa's smile was a reflection of her considerable sexual desire.)

The Surrealists sought to build upon the irrational as the source of artistic imagery and activity, to break from the restrictions of humdrum everyday reality, and to free the mind from convention and logic. André Breton, who wrote two Surrealist “manifestos” (in 1924 and 1927) developed the technique of “automatic writing” as a means of creating a direct line to the unconscious. Breton also wrote *Surrealism and Painting*, a tract that identified artists whose art was consistent with the two primary goals of the movement: either those like Joan Miró, whose work was mostly abstract and who attempted to find a visual equivalent of automatic writing, and those like Salvador Dalí, who tapped into dream imagery but depicted it realistically so that the unexpected became

palpable. Surrealists valued eroticism as a way of accessing the unconscious, and they valorized the “femme-enfant,” the child-woman, who could serve as a muse to the male artist. Several such “muses”—Leonora Carrington, Lee Miller, Dorothea Tanning, and Meret Oppenheim, whose fur-lined tea-cup (*Breakfast in Fur*, 1936) became the iconic surrealist object—were artists in their own rights, who helped to keep the movement alive for decades after its first appearance. When a number of Surrealist artists fled the Nazi persecution, like Max Ernst (who had been involved with Leonora Carrington while in France but who married Peggy Guggenheim and later Dorothea Tanning), they established residency in New York, and with other émigrés contributed to the transplantation of European modernism to the New World.

Europe in New York

During the 1940s and 1950s New York City, despite its location across the Atlantic, assumed the role that had previously been identified with Paris and became the art capitol of the European art tradition. Abstract Expressionism, the most significant movement of the mid-twentieth century, grew from the Surrealist impulse to exteriorize internal states. Jackson Pollock’s drip technique, in which the control of the artist’s hand was subverted as he danced around a canvas placed on the floor, splattering paint, could be considered a form of automatic writing. During the fifties and sixties in Europe *art brut* (“raw art”) and *arte povera* (“poor art”) were prominent, both movements influenced by the anti-art aspects of Dada.

In the latter part of the century it seemed as if the debate accelerated to the point where the purpose of art was being continually redefined every few years, in such movements as Pop Art and its use of everyday imagery, or Minimalism and its total eschewal of representation. The German sculptor and performance artists Joseph Beuys (and other conceptual artists in particular) referred back to Dada, using the stuff of everyday life in their work. Furthermore, art became increasingly more self-referential and began to challenge the hegemony of Western culture and its master

Marcel Duchamp, *Fountain* (1917). Duchamp often took a “found object,” such as this urinal, and, after embellishing it or not, exhibited it as a work of art. Photograph by Alfred Stieglitz.

narratives through irony, parody, and the blurring of lines between the high and the low, in an attempt to destabilize and decentralize the artistic tradition. These traits became associated with the stance of Postmodernism, a philosophical movement expressed also through architecture and literary criticism.

At the same time, feminists began to retrieve the works of many “lost” women artists, individuals who might have had an impact in their times but who were obscured by the historical narrative. The art historian Linda Nochlin found that many of the women who were able to have artistic careers prior to the nineteenth century—such as, famously, Artemisia Gentileschi (1593–1656)—did so because their fathers were artists, which gave them access to the requisite education. This historical recovery work was very significant to women artists during the 1970s and subsequent years, and they began to engage through their art with the historical exclusion of women. Hundreds of volunteers from 1974 to 1979 worked with Judy Chicago on her installation *The Dinner Party*, to which Chicago “invited” thirty-nine significant female figures

(including Hatshepsut, Hildegard von Bingen, and Sacajawea). Three 48-foot banquet tables, configured in a triangle and covered in embroidered textiles and table runners, held individually themed place settings, including custom-designed dinnerware painted with motifs evoking female genitalia and other symbols significant to each guest.

In *The French Collection* (1991–1997), a series of painted “story quilts,” the Bronx-born painter and writer Faith Ringgold drew on iconic works and figures from European art and culture to present a narrative of “art in the making” in which “history” is either altered by (or infused with) the presence of a fictional African American female artist as a central character. Works such as *The Picnic at Giverny*, which juxtaposes full-bodied allusions to the paintings of Manet (*Dejeuner sur l’herbe*) and Monet, function as both playful and serious social commentaries.

In many world cultures art is an intrinsic form of lived experiences whereas in the European art tradition, high art and the daily environment became bifurcated. Unfortunately, despite the aforementioned attempts, during the remainder of the twentieth century, they only became more separated, and in the twenty-first century there seems to be an increasingly unbridgeable gap between artists and their audience.

Art—Japan

Japanese art has alternated between a native style and others inspired by Chinese, Korean, and, later, Western influence. Neolithic Jōmon pottery was the earliest art; metalwork, calligraphy, and painting appeared in succeeding periods. Buddhist art and architecture dominated from 600 to 1600 CE. Japanese culture flourished after 1600 with economic prosperity, and Western contact after the mid-1800s brought new styles and international exposure.

The art of Japan demonstrates the sensitive character of the inhabitants of that East Asian archipelago over a period of more than eighteen thousand years. Among the more consistent qualities revealed through Japanese art are a love of nature, attention to detail, playfulness, a preference for natural materials, and the ability to succinctly capture the innate qualities of a subject. Japanese history is divided into periods that are named for the location of the national seat of political power.

Jōmon Culture

The oldest human artifacts of unglazed earthenware appear to date from Japan's Jōmon period (c. 10,000–300 BCE). These ceramics, mostly vessels, are typically decorated with overall patterns of incised or impressed decoration, some of them made by rolling the surface with braided cords or ropes. For this reason, the ceramics, the

people, and the long Neolithic period to which they belong were given the name “Jōmon” (cord-marked). The Jōmon people, unlike most ceramics-producing cultures, were primarily hunter-gatherers. Scholars since the mid-twentieth century have debated the date for the beginning of the period, as early as 16,500 BCE by some estimates—not only about when the transition from Paleolithic to Neolithic technology took place (the dates continue to recede with new discoveries), but whether Jōmon earthenware is indeed the world's oldest ceramic type.

The stylistic characteristics of Jōmon pottery vary geographically and according to the phase from which they date. In Middle Jōmon, earthenware vessels often featured spectacularly extruded mouths, referred to as “flame-style” (*kaenshiki*) rims by Japanese archaeologists. In Final Jōmon, clay figures called *dogu* were created to be broken during rituals that may have been intended to improve fertility or to combat illness. The predominantly abstract decoration on Jōmon wares may be of religious or ritual significance.

Yayoi Culture

The beginning of the Yayoi period (300 BCE–300 CE) marks an influx into Japan of immigrants from continental Asia who brought

Jōmon (cord-marked) pottery (10,000–8,000 BCE) is decorated with incised or impressed patterns made by rolling the surface over braided cord or rope. Tokyo National Museum, Japan.

systematized wet rice agriculture, hierarchical societal organization, and technology for manufacturing bronze. Tools, weapons, and mirrors of bronze began to be made within a century or two after similar items arrived from China and Korea. One of the more idiosyncratic Yayoi bronze objects is a type of bell known as the *dōtaku*. These bells appear to derive from bronze bells of the Chinese Han dynasty (206 BCE–220 CE) and, made during the second half of the Yayoi period, were probably intended for ritual use. One example bears cast designs, including a representation of a grain storehouse on stilts. The similarity of this storehouse to existing Shinto shrine buildings, such as the principal halls in the shrine complexes of Ise and Izumo, may indicate that at least some aspects of the Shinto religion originated during Yayoi period. Yayoi period earthenware, simpler in form than that of the Jōmon, comprised vessels for ritual and household use. Like Jōmon ware, it was made from coils of clay, but was smoothly finished by the use of a small handwheel.

Kofun Period

The Kofun period (300–710 CE) is named for the numerous tumuli (*kofun*) constructed from around the mid-third century until after the introduction of Buddhism in Japan, around 550 CE. Buried within these tomb mounds were a variety of items that reveal close connections between Japan's aristocracy and inhabitants of the Korean Peninsula. Some items, such as gray earthenware funerary vessels, beads, and certain items of metalwork from fifth- and sixth-century Japanese and Korean tombs, can be distinguished only by specialists. Tumuli were mostly small, especially at the beginning of the period, but those built for emperors such

as Nintoku (reigned 313–399) were huge, keyhole-shaped constructions surrounded by moats. Some tumuli had burial chambers lined with stone that were decorated with wall paintings. Earthenware cylinders known as *haniwa*, arranged atop and around the perimeter of some tomb mounds, were commonly surmounted with clay figures in the form of humans, animals, or even inanimate objects such as shields or buildings. The exact purpose or function of these earthenware sculptures is uncertain, but it seems likely that they were intended to support the deceased in the afterlife.

Asuka Period

The Asuka period (552–645 CE) overlaps the preceding Kofun period and marks the introduction of both Buddhism and writing from continental Asia. Because of those features, it is Japan's first fully historical period. Within three decades following the adoption of Buddhism as the state religion under the Soga clan in 587 CE, three Buddhist temples in the Nara-Osaka region were established. Although all three were completely or mostly destroyed over the centuries, works of art from them survive, mainly in the temple called Hōryū-ji (in Nara Prefecture). The most significant Buddhist sculpture of the period comprises several works by Tori Busshi (active late sixth–early seventh centuries). Tori's masterpiece is the gilt bronze *Shaka Triad* of 623, now located in the Golden Hall (Kondō) of Hōryū-ji. The three figures resemble Chinese

Dōtaku Bronze Bell. Late Yayoi period, third century CE. These bells, intended for ritual use, apparently derive from Han-dynasty (206 BCE–220 CE) China bronze bells. Musée Guimet, Paris.

Tori Busshi, *Shaka Triad of 623*. From *Selected Relics of Japanese Art, 20 Volume Set*. Photographs and Collotypes by K. Ogawa. (1899–1908). Nippon Shimbi Kyokwai: Shimbi Shoin.

Buddhist sculptures from the Northern Wei kingdom (part of China's Southern and Northern Dynasties, 220–589 CE). A bodhisattva (enlightened deity) figure in Hōryū-ji is known as the *Kudara Kannon*, which tradition says was brought to Japan from Korea's Paekche (Kudara) kingdom (18 BCE–663 CE). These sculptures, as well as the layout and architecture of buildings such as Hōryū-ji's Golden Hall and pagoda (late seventh century), reflect the strong influence of continental Buddhist models.

Nara Period

Continental models were even more influential during the Nara period (710–794 CE). Throughout the eighth century CE, the influence of Tang dynasty China (618–907 CE) was dominant in works made for the Buddhist establishment and the aristocracy. Heijō-kyō, the capital (modern Nara City), was laid out in the manner of Chang'an (modern Xi'an), the capital of the China's Tang dynasty. During the rule of Japanese emperor Shōmu (reigned 715–749 CE), a huge temple,

called Tōdai-ji, was built in Nara to house a massive bronze image of the Dainichi Buddha (called Vairocana in Sanskrit). The current hall, an eighteenth-century replacement only two-thirds the size of the original, remains the largest wooden building in the world. Emperor Shōmu also ordered the establishment of regional Buddhist temples throughout Japan under the *kokubunji* system, which necessitated the production of large numbers of Buddhist statues and implements in Tang dynasty style. In contrast with Asuka period Buddhist images, Nara period sculpture featured rounder, fleshier figures imbued with a sense of elegance and movement.

As rulers of the easternmost point of the Silk Roads, eighth-century Japanese emperors had access to luxury goods from as far away as Persia. The active trade that took place is reflected in the high-quality artworks preserved in the Shōsō-in repository, established in 756 to house the possessions of Emperor Shōmu. Among the items kept there are mirrors, textiles, ceramics, lacquerware, furniture, musical instruments, glass objects, and paintings. Some of

the works are of continental manufacture, while others are domestic products that show the impact of imported forms, materials, and techniques.

Heian Period

In 794 CE, Emperor Kanmu (737–806 CE) moved the capital to a new site, Heian-kyō (modern Kyoto), initiating the Heian period (794–1185). Contact with China declined after 894, when the Japanese court ceased to send embassies to the continent. In response, native art and architecture began to develop along independent lines. The buildings of the imperial palace were constructed in a hybrid Sino-Japanese form, with gardens and furnishings of native taste, while retaining certain Chinese elements to communicate weight and authority. A distinctly Japanese court culture grew up, described in great detail in Lady Murasaki Shikibu's tenth-century novel *The Tale of Genji*, and illustrated in a superb set of twelfth-century narrative hand scrolls, the *Genji monogatari emaki*. The scrolls, only a few of which survive, feature not only compelling paintings of scenes found in the novel, but outstanding calligraphy, another hallmark of visual culture of the Heian court. The illustrations, which use a complex system of perspective, placement, and color but depict human faces in a quite generalized manner, represent the beginnings of a native form of painting known as Yamato-e.

In the early part of the period, the two Esoteric Buddhist sects of Tendai (Tiantai in Chinese) and Shingon (Zhenyan in Chinese) were introduced from China. These sects emphasized secret knowledge and complex rituals, often using cosmic diagrams known as mandalas. Numerous colorful and minutely detailed mandala paintings were made during the Heian period. In the middle and latter parts of the period, the populist Pure Land (Jōdo) sect grew, and many sculptures of the Amida Buddha (Amitabha in Sanskrit) were constructed. Most notable is the sublime Amida figure by Jōchō (d. 1057) made for the Phoenix Hall (Hōōdō) at the temple called Byōdō-in. The temple was built as a personal shrine for the

Mandala of the Single-Syllable Golden Wheel. (Heian period, twelfth century.) Minutely detailed cosmic diagrams (mandalas) became popular as the Pure Land sect of Buddhism grew. Nara National Museum.

government official Fujiwara Yorimichi (990–1074) in 1052.

Kamakura Period

In 1185 CE, the Minamoto warrior clan defeated its rival, the Taira clan, and established a military government that ruled in the emperor's stead. Seeking refuge from court influence, the first shogun moved his seat of power to Kamakura, far from earlier capitals. In contrast to the refined and elegant Heian art, Kamakura period (1185–1333) works are characterized by

stronger, more straightforward approaches. In Buddhist sculpture, works by Unkei (1148?–1223) and others of the Kei school of sculptors display a powerful naturalism that reflects the rise of military culture. The Jōdo monks Hōnen (1133–1212) and Shinran (1173–1263) exploited unease about the changes in society, inspiring greater numbers to place faith in the Amida Buddha. As a result, paintings of Amida descending to greet the soul of a dying believer (*raigō* paintings) and depictions of Amida's Western Paradise (Saihō Gokuraku) came to be made in large numbers using valuable materials such as silk and gold leaf. Portraiture grew in popularity, especially among the military elites and Buddhist clergy, following the same trend toward naturalism as sculpture.

Muromachi Period

Following his defeat of the Kamakura government regents in 1333, Ashikaga Takauji (1305–1358 CE) set up his own military government in the Muromachi district of Kyoto. Although much of the Muromachi period (1333–1573) was tumultuous, certain art forms did flourish. Zen temples grew in number and influence because of the support of the military class. Zen-inspired calligraphy and ink painting prospered, as did rock-and-gravel gardens (*sekitei*) such as those at the Kyoto temple named Ryōan-ji. The most famous painter of the period was Sesshō Tōyō (1420–1506), a priest whose work built upon styles of ink painting developed in China during the Song dynasty (960–1279). Sesshō traveled to China in 1469–1470, and his painting reportedly was highly admired by Chinese at the time. His most celebrated works are landscapes in ink, sometimes with light color added.

The cultural apex of the period came under the rule of Ashikaga Yoshimitsu (1358–1408), who subdued

warring factions, reopened official contacts with China, and encouraged the arts. Under his patronage, the Noh drama developed, and outstanding masks and robes for the theater were created. Yoshimitsu built a personal retreat at Kitayama, which included a building called the Golden Pavilion (Kinkaku). The three-story building, famous for the gold leaf on its exterior, is an innovative combination of three architectural styles: Zen temple, warrior dwelling, and court residence. Sited in a beautiful strolling garden with a lake, the current building is a close replica of the original, which burned in 1950. Yoshimitsu's grandson, Ashikaga Yoshimasa (1435–1490), built his own retreat at Higashiyama, with its own unique building, the Silver Pavillion (Ginkaku). The two-story building, never covered in silver, was the centerpiece for Yoshimasa's aesthetic diversions, later known collectively as “Higashiyama culture” (Higashiyama *bunka*). These pastimes included Noh drama, garden design, art collecting, and tea ritual. Yoshimasa's influence continued to be felt in these areas over the succeeding centuries.

Momoyama Period

In 1573, Oda Nobunaga (1534–1582) deposed the final Ashikaga shogun and continued his quest to consolidate military and political power over all Japan. After his assassination in 1582, the same pursuit was taken up by Toyotomi Hideyoshi (1537–1598) and largely achieved; yet it was not until Tokugawa

Kongorikishi statue. (Kamakura period, fourteenth century.) This flamboyantly realistic wood statue, typical of the period, originally stood guard at the gate to Ebaradera, a temple in Sakai, near Osaka. Sackler Gallery at the Smithsonian Institution.

Ieyasu (1543–1616) that an enduring dynasty could be established and internecine warfare eliminated. Despite intermittent warfare, the Momoyama period (1573–1600) marked one of the most creative eras in the history of Japan. Active trade provided cultural stimulation, as Japanese ships sailed throughout East and Southeast Asia. European merchants and missionaries were welcomed, and many of the items they brought were incorporated into Japanese visual and material culture. Decorative motifs in applied arts such as lacquerware and textiles were particularly influenced by foreign designs. Painting

was characterized by the growth of several existing schools and the establishment of others, spurred by the demand for artistically embellished sliding doors and folding screens for the interiors of elite residences and castles. Many of these works featured backgrounds of gold-leafed paper that helped reflect light in the dark interiors of large buildings. Among the most prominent painters were Hasegawa Tōhaku (1539–1610), Kaihō Yōshō (1533–1615), and Kano Eitoku (1543–1590), whose bold and striking works came to characterize the vibrant ambiance of the Momoyama period.

Under the influence of codified tea drinking, sometimes known as the tea ceremony, notable

advancements were made in ceramics. In the 1570s, the low-fired, glazed ceramic later to be called Raku ware was devised, and Raku tea bowls soon achieved popularity among tea connoisseurs. The capture and inducement of continental potters to Japan during the 1592–1598 invasions of Korea resulted in the rapid advance of ceramics technology and the concurrent expansion of production throughout the country. Tea masters like Sen Rikyō (1522–1591) encouraged the creation of original and idiosyncratic wares that reflected the somber and restrained aesthetic known as *wabi* (rustic simplicity).

Edo Period

In 1603, Tokugawa Ieyasu became shogun, establishing in the city of Edo a line of hereditary military rulers who would control Japan for over 250 years

(known as the Edo period, 1600/1603–1868). The beginning of Tokugawa rule overlaps with the latter Momoyama period, since Ieyasu did not completely vanquish his Toyotomi rivals until 1615. Once in control, the Tokugawa shogunate instituted a policy of national isolation and a rigid Neo-Confucian class system. Such measures curtailed individual freedoms, but also contributed to general economic prosperity and social stability. These in turn stimulated unprecedented growth in the arts, especially among the common people.

During the seventeenth century, Kyoto remained the capital of arts and culture, experiencing a renaissance of culture reminiscent of that of the Heian period. Emblematic of this renaissance was Hon'ami Kōetsu (1558–1637), a Kyoto artist who excelled in calligraphy, lacquerware, and raku tea bowls. Collaborating with the painter Tawaraya Sōtatsu (flourished early seventeenth century), founder of

Rinpa-style painting, Hon'ami created scrolls featuring classical poems inscribed against a backdrop of evocative natural designs by Tawaraya in gold and silver pigments. Toward the end of the century, Ogata Kōrin (1658–1716) brought Rinpa style to full flower in his striking compositions created by abbreviating and carefully arranging pictorial elements. Kōrin's brother, Ogata Kenzan (1663–1743), translated Rinpa into the ceramic format, devising innovative implements for use in the practice of tea.

Among warrior-class elites, the two most influential painting schools were the Kano school, based upon Chinese art traditions, and the Tosa school, descended from Heian period Yamato-e. In the eighteenth century, however, new styles of painting developed. Notable among them were the literati (Bunjinga) style, an outgrowth of Chinese scholar painting of the Ming (1368–1644) and Qing (1644–1912) dynasties, and the Maruyama-Shijō school, which incorporated elements of European naturalism into native modes of depiction. Within the merchant class, genre painting gave way to paintings and woodblock prints featuring beautiful women, actors,

and travel landscapes. This style, known as *ukiyo-e* (floating world pictures), eventually became Japan's most widely known artistic style.

Modern Period

In 1854, the re-establishment of international contact began with the opening of ports that had been closed to foreign commerce for more than two centuries. European artistic ideas flowed freely into the country, and soon "painting in the Western manner" (Yōga) was firmly established. In the 1880s, with the encouragement of the American scholar Ernest Fenollosa (1853–1908), native painting practices reasserted themselves, combining into a new tradition called Nihonga (Japanese painting). Nihonga used native materials and formats, such as painting with ink and mineral pigments on paper or silk, but also incorporated certain aspects of Western traditions such as shading and perspective. During the twentieth century, distinctions between the two modes became increasingly blurred, but the separation continued to be recognized in official art circles, especially the annual national art exhibitions first held in

"Entrance to the Kasuga Shrine at Nara and Group of Consecrated Maidens," circa 1910. This shrine of the Fujiwara family was rebuilt through the centuries after its initial construction in 768 CE. New York Public Library.

Kitagawa Utamaro (c. 1753–1806), *Uzuki no hototogisu*. Utamaro was renowned for prints of beautiful women and Kabuki actors. Here, a cuckoo hovers over the women's heads.

1907 and later known as Nitten (Japan Exhibition). In the 1950s, artists like Yoshihara Jirō (1905–1972) began to explore concepts such as abstraction and performance art, becoming the first in Asia to present a credible challenge to the West from an equal artistic footing.

In the twenty-first century, art in Japan is as diverse as in any country in the world. A large number of Japanese artists are recognized internationally, especially in nontraditional genres such as installation art and video. In addition, the comic book / cartoon art genres of Manga and Anime have had tremendous

impact on artists worldwide, especially those born after 1980.

Art—Native North America

More than five hundred cultural groups, and many more prior to Spanish colonization in the early sixteenth century, have created the body of art attributed to Native North Americans. The category is thus not cohesive, ranging from ancient petroglyphs to contemporary photographs, and from horse-effigy dance sticks to installation and performance art. In its great diversity, however, it typically incorporates and conveys a relationship to place and community.

In the twenty-first century many art historians, as well as scholars in related and interdisciplinary fields, have begun to refer to art produced by the indigenous populations of North America—from the Rio Grande to the Arctic Circle and from the Atlantic to the Pacific coasts—as “First American art.” The term establishes the corpus of diverse material artifacts made by original and descendant inhabitants of these lands—and not by occupants who arrived through waves of colonial encounters beginning in the sixteenth century—as primary among the arts of the United States and Canada (where it is called “First Nations art”). Even in its great diversity, this art typically incorporates and conveys a relationship to place and community. Often a deliberate reference to identity (or intimacy with the culture) is central to its expressive intent. The wide span of this art created over space, time, and cultures attests to its vitality and conceptual continuity, from 4500 BCE Lower Mississippi Valley mound architecture to the recently opened National Museum of the American Indian, a native-designed structure housing the world’s largest collection of First American art.

Ancient architectural ruins in the Southwest, sites that have now been differentiated as pre-European contact, include cultures of the Anasazi (700–1400 CE), Hohokam (550–1400 CE), and Mogollon (200–1150 CE). All these cultures created painted murals, decoratively elaborated pottery, worked shell and stone, and early textiles that tangibly evinced a technologically advanced “primitive” society perceived as a nascent civilization. The material remains of other ancient peoples, including the Adena (1100 BCE–200 CE), Hopewell (100 BCE–500 CE), and Mississippian cultures (still noted for extensive mound construction in 1000 CE) in the east and central United States, together with Norton Tradition, Old Bering Sea, Dorset, and Thule cultures in the Canadian Arctic (spanning the period 500 BCE–1000 CE), provide evidence of America’s antiquity, and are today also appreciated for their aesthetic legacy.

But with contributions from more than five hundred cultural groups and many more prior to Spanish colonization, the category is by no means cohesive. First American art spans an array of media, from petroglyphs to contemporary photographs, for instance, and from horse-effigy dance sticks to installation and performance art. Critical reception to indigenous art is divided and often depends on whether the works were wrought in traditional (that is, historic and pre-contact) materials or created in modern times in contemporary modes.

First American Art: From “Curiosity” to Aesthetic

The need to designate “First American art” evolves from a long-standing debate about whether or not

Tsimshian head-on mask. (1800s.) This painted wood mask, used during the initiation rituals of the great winter ceremonies (*halait*), was collected at the mouth of the Nass River, British Columbia (Canada).

art work created by the indigenous peoples of North America can be called “art.” Europeans (especially the Spanish, English, Dutch, French, and Russians) began acquiring “curiosities” made by the native inhabitants of the “New World” when they arrived on its foreign soil, and many of these objects still exist in European museums in cities such as Berlin, Helsinki, Leningrad, London, and Paris. In the nineteenth century objects made by American Indians became the focus of systematic U.S. collecting and formed the core of most urban museum collections: Indian imagery provided a potent focus of the young nation-state until France’s 1883 gift of the Statue of Liberty.

Indigenous peoples often exchanged valued objects with Europeans, symbolically solidifying international relations and sometimes representing them. For instance, the first treaty between the Haudenosaunee peoples and the Dutch settlers in their region was recorded in the Two-Row Wampum Belt in 1613. The pattern of purple wampum beads sewn in two strips against a background of white beads signifies the path of two vessels, an indigenous canoe and

a European ship, as they travel the river of life together, parallel but never touching. The three underlying white stripes symbolize peace, friendship, and respect. Another iconic example in Native American art history is the late eighteenth-century Mandan or Lakota pictographic bison robe attributed to the collection acquired by the Lewis and Clark Expedition (1804–1806). On battle robes such as this one, made from tanned buffalo hide decorated with deerskin fringe, bird and porcupine quills, and native plant materials, indigenous artists used brown, orange, and green pigments to paint scenes using a complex iconography that detailed their exploits in war. The Lewis and Clark robe, now at the Peabody Museum of Archaeology and Ethnology at Harvard, provides an early example of Plains biographical art and serves as a symbol of the diplomacy and political relations that helped form the United States.

The observations that the German artist Albrecht Dürer recorded in his 1520 travel journal about an exhibit in Brussels of Aztec jewelry, clothing, weaponry, and armor—“nothing . . . rejoiced my heart so much

as these things, for I saw amongst them wonderful works of art”—marks a historic moment in the European appreciation of the potential value of objects from the Americas (Dürer 1520). (Hernan Cortés had sent the Aztec treasures as tribute to Charles V, Spanish king and Holy Roman Emperor, who put them on display throughout Europe.) Such exposure increased as these objects were housed in national museums beginning in the eighteenth century. Representation of Native Americans began to pervade the wider visual media beginning in the sixteenth century, sometimes as illustrative material accompanying traveling exhibitions about indigenous peoples, but by the nineteenth century Indians became pictorial subjects in their own right (in the paintings of George Catlin, for example) or were portrayed as “natural” elements within other genres like landscape painting (in the work of Albert Bierstadt and George Caleb Bingham).

The cultural evolutionism of nineteenth-century theorists such as Lewis Henry Morgan provided the stimulus for large-scale collecting in America. Patterned after their natural history counterparts, exhibitions resulting from nineteenth-century archaeological and ethnological exploration were displayed in museums as “remnants of a waning race” organized by the culture–area approach, a classification of peoples by geographic and environmental criteria that often still informs even art museum exhibitions. In those displays and the curatorial descriptions that accompanied them, Pueblo ruins were likened to European prototypes as an “ancient Pompeii,” “Greek theatre,” or “Roman forum” (as, for example, in William H. Jackson’s *Reconstruction of Pueblo Bonito, Chaco Canyon*). By the twentieth century Pueblo architecture and other native influences inspired diverse architects to develop specifically American forms. Mary Colter used Hopi, Zuni, and Navajo elements in the tourist-oriented buildings she designed to rim the Grand Canyon; Vincent Scully, the renowned art historian, wrote (and taught) extensively about native influences in American architecture; and Frank Lloyd Wright incorporated native influences in form as well as in decorative elements that he himself designed, such as

the friezes of Native American chieftains found on a the lintels of a house in Milwaukee.

World fairs and industrial expositions, notably the U.S. Centennial Exhibition (Philadelphia, 1876) and the World’s Pre-Columbian Exhibition (Chicago, 1893), were important venues for the representation of America’s native peoples and their arts (although both were pictured as technological inferiors). Euro-American intellectuals gained access to native peoples not only through visual and textual representations, but also through intimate association with them. Aby Warburg, a central figure in modern art history specializing in the Italian Renaissance, was impressed by the religious practices of the Hopi Indians he visited and photographed. Warburg, who considered his encounter with the Hopi as a journey to the origins of human imagery, collected a number of carved and painted wooden katchinas and dance wands in the 1890s. For other Euro-American collectors, too, ritual objects have been particularly desirable (despite the consternation of the natives to whom such objects remain living beings). Western European fine artists have continued to use non-Western images and objects to explore philosophical ideas and to challenge and subvert their own cultural conventions.

The aesthetic concern with Primitivism, a handmaiden of Modernism in which Native American art figured importantly, was prominent from the 1890s through World War II; its influence is still felt in current non-native representations of Native American art. The Aesthetic and Arts and Crafts movements also stimulated a wider interest in—and the collection of—Native American objects in the late nineteenth and early twentieth centuries.

Beginning in the twentieth century, studies of Native American art (notably the elaborate carvings and richly costumed performances of the Northwest Coast’s stratified societies, many of which were explored in the seminal work of anthropologist Franz Boas and his students) helped to turn academic attention away from evolutionary concerns to the formal properties of objects and their cultural contexts. In fashioning a particularly American fine-art tradition,

namely Abstract Expressionism, New York avant-garde artists, chief among them Jackson Pollack and Barnett Newman, drew on Native American art between the two world wars and rejected European academic traditions. By espousing a universal concept of art in which visual qualities were valued independent of historical and cultural specificity, these artists (and critics such as Clement Greenberg) demonstrated the value of native cultures to a modern American heritage on the eve of global conflict at mid-century. Canada and Australia, sister postcolonial nation-states, have also utilized the aesthetic value of indigenous productions in their national identities.

The Museum of Modern Art's 1941 exhibit "Indian Art of the United States" and especially the later "Primitivism' in Twentieth Century Art: Affinity of the Tribal and the Modern" (1984) were watershed events in the representation and classification of Native American objects, provoking academic debate that has lasted into the twenty-first century. In the twentieth century, American museums were distinguished from their European counterparts by their emphasis on modern or contemporary and primitive art over classical forms, with Native American art figuring prominently in several national and international traveling exhibitions (especially the one that commemorated the U.S. Bicentennial). In Europe prior to World War II, the surrealists favored Native American art as a way of subverting established canons and establishing new syntheses of perception and representation in opposition to modernist trends.

Thus by the mid-twentieth century a concentrated articulation of aesthetic value for these objects emerged in concert with an increasing number of named artists and private collectors; an expansive market, wide museum exhibition, and art historical surveys characterized the last quarter of that century. In the Western art tradition work must be inscribed into a canon that assesses its quality and defines its criteria, and Native American work was just beginning to be "written" as a tradition. By the late twentieth century Native American art became a recognized field with the full complement of institutional networks, including

academic specialization. Controversy over classification still centered on how to appreciate "traditional" work that seemed to morph out of an altered social landscape by incorporating European materials and designs (such as the flourishing "souvenirs" of Native American art from the Northeast in the eighteenth and nineteenth centuries, or post-reservation Plains beadwork). Debates arose over how to distinguish between an ethnological artifact and an aesthetic object—natural history and art history paradigms, respectively.

In 2003 the Smithsonian's National Museum of the American Indian opened a three-year-long exhibition culled from the Charles and Valerie Diker collection and called "First American Art." The exhibit departed from the traditional, historically influenced approach of displaying and analyzing native works according to tribe or region; instead it attempted to define a First American art paradigm. Because the Dikers were drawn to the work they collected by its beauty rather than by an interest in a specific "category" of work, the native and non-native artists, curators, and anthropologists involved in the planning the exhibit sought a way to present the collection based on a First American Art aesthetic. They isolated and explored the following seven qualities inherent to, or elicited from, the work of Native Americans, and structured the exhibit around ways to explore them: *integrity* (to tribal identity, values, and ideals, despite the incorporation of new materials and techniques); *emotion* (in response to ideas and materials combined); *movement* (literally kinetic, or symbolic through pattern and design); *idea* (being part of a larger system of knowledge and philosophy, or being the idea itself); *composition* (the physical and spiritual combination of technique and materials); *intimacy* (the relationship of the maker and the user to the art); and *vocabulary* (the ability to express and encode the culture in materials, technique, and iconography). While such components may arguably be assigned to apply to world art (the material objects created by all cultures, whether they are to be deemed art or craft) the effort was an important step in a world-historical way—an opportunity to model not just exhibitions of Native

A rare Yokut Sun Dance basket woven with alternating rows of diamond patterns and human figures joining hands. Dover Pictorial Archives.

American art, but the field of study itself, so that art can help to explain the functioning and beliefs of a given culture.

Present-Day Identity and Artists

Difficulty or a lack of interest in identifying the maker of an object, combined with the problem of determining the maker's reputation for quality work, contributed to anonymity throughout the history of Native American artistic creations. Due to the frequently remote locations of origin, the fact that objects were often traded among indigenous groups and European merchants before arriving in private or public institutions, and the social nature of production in many traditional arts, individual makers and even tribal attributions could not always be made. Further, until the twentieth century, as a result of forced assimilation policies and compulsory off-reservation education, linguistic differences also separated objects from their original contexts and meanings in non-native eyes. Hence, the recognition of individual

artists was an important twentieth-century development because it contributed to the value of the work in the art world, and yet many unnamed native artists still produce a vast array of aesthetic material without such recognition.

Among the notable practitioners of traditional native arts before the twentieth century who did not remain anonymous is the Washoe artist Dat So La Lee (Louisa Keyser) who died in 1925 yet gave name and face to the otherwise perceived "utilitarian" (and hence derided) aesthetic practice of basketry. Until very recently, these traditional art forms and others (for example, Navajo weaving) continued to be represented by non-natives as objects and practices of a presumed "past" way of life, not the aesthetic expression of surviving and thriving contemporary peoples who are giving continuing meaning to their lives. New forms have arisen from these precursors, such as haute couture clothing utilizing Northwest Coast crest art (Dorothy Grant and Robert Davidson, Haida) and the fine-art tapestries of Ramona Sakiestewa, Hopi.

under the Works Progress
Administration (WPA).

Pueblo pottery and Northwest Coast carving continue to flourish today, some having undergone revivals through stimulation by traders, dealers, and native artists, and often using museum collections as prototypes. The Hopi-Tewa potter Nampeyo, active from the 1880s to her death in 1942, was the first Indian artist recognized by name in the art world in her lifetime. Her descendants, including Dextra Quotskuyva and many others, continue to make distinctive hand-coiled and ground-fired pottery of local materials interpreted in new ways. Robert Davidson, Haida, works to expand the carving tradition recognized in the nineteenth century and practiced by his forebear Tahaygen (Charles Edenshaw).

Training in contemporary media and studio art for native persons was first undertaken in Santa Fe's School of Indian Art, founded in the interwar years

(and often called the Dorothea Dunn school after one of its most prominent teachers); it became the Institute of American Indian Arts in 1962. Renowned and award-winning students include Pablita Velarde (1918–2006), Santa Clara Pueblo, a watercolorist who later turned to using pigments she derived from minerals and rock, and which she ground herself; Allan Houser (1914–1994), Chiricahua Apache, a sculptor of bronze, marble, and stone whose vision to create a family compound near Santa Fe culminated in sculpture gardens and studios that are now open to the public by appointment; Fritz Scholder (1937–2005), Luiseño, a prolific and controversial expressionist painter who used distortion, vivid color, and explosive brushstrokes to explore publicly held stereotypes of Native American; and Gerald McMaster (b. 1953), Plains Cree, who in 1995 curated an

exhibition of First Nations Canadian artists at the prestigious Venice Biennale.

Formal training now occurs in departments at major universities and art schools across the United States and Canada, launching a new generation of artists eager to articulate the significance of their art. These artists typically work in contemporary or nontraditional media but often combine elements of both; they create provocative works that challenge the boundaries of conventional representations in traditional work as well as the romanticism reproduced in them (the densely packed compositions of Jane Ash Poitras, Cree/Chipewyan, provide an example).

Recent scholarship in both anthropology and art history, by non-natives and natives alike, has begun to break the steel-like frame of criteria used to evaluate “primitive,” “traditional,” and “contemporary” media. New studies also explore the cultural significance of media (for instance, clay, grasses, hide, or wood) from the practitioners’ perspectives, and look at how language and storytelling, as “indigenous national histories,” construct not only the object’s value but also the activity or process of making art. Native voices have been reclaimed and given prominence in a new articulation of value, as the enumeration of seven aesthetic principles articulated by the “First American Art” exhibit at the Smithsonian attests. Manipulating a variety of media, including that of their ancestors, these artists challenge the very basis of aesthetic appreciation in the Western fine-art world. Their art and the articulation of its meaning is now being inscribed into the art-historical discourse. This marks a new moment in both the philosophy and the history of art. Gender, of course, is an integral dimension of this transformation, since native women have long been recognized as artists and creators of material forms that embody and help to reproduce local systems of knowledge. In this global environment, Native North American, First Nations, or First American art reveals how hybrid forms based on the knowledge of indigenous contexts relate to a wider world and thus actively realize beauty and meaning in rich and varied ways.

This achievement may yet be the greatest influence of this art in world history.

Art—Paleolithic

In light of recent archaeological discoveries in Africa, scholars in a growing number of disciplines are reviving interest in Paleolithic (Old Stone Age / foraging era) art, opening up debate on fundamental world history questions that involve the origins of human art making; the physical, mental, social, and cultural conditions that made it possible; and the fact that creating art has endured and become increasingly integral to our existence.

Humans have practiced the visual arts in whatever part of the globe they came to inhabit. Within the context of world history the earliest manifestation of these arts in the Paleolithic (foraging) era merits attention. The basic questions of when and how the visual arts had come into being raised considerable interest among students of art history, archaeology, and anthropology in the decades surrounding 1900. But for most of the twentieth century discussion about the earliest art forms was relegated to the margins of academic concern, due in part to the highly speculative character of the various theories that proposed to account for them. Today questions concerning Paleolithic art have become topical again, although speculation remains. One important impetus to rejuvenating the field are the archaeological discoveries that have recently been made in Africa. These discoveries prompt us to completely reconsider early artistic behavior in terms of both time and place. Various new theories attempting to explain the emergence of art making add excitement to the field. This article introduces some of the latest developments in Paleolithic art studies.

The Beginning of Aesthetics and Meaning

The Paleolithic era, or Old Stone Age, starts when humans begin making stone tools, some 2.5 million years ago. The art historian David Summers has provocatively suggested that art history, too, starts at this moment. Whatever art is, he theorizes, it refers to something that is made—it is an instance of what he calls “facture.” Rudimentary as the earliest stone tools from East Africa may be, they do present the first material evidence of the human capacity to transform a medium, in this case to shape a stone by working it with another. By employing the qualifying term *art*, however, we usually imply additional characteristics, most frequently either “aesthetics” or “meaning,” and quite often both. “Aesthetics” requires that an object have a captivating appearance for it to be called art. Visual artistic behavior then refers to such activities as modifying human bodies and objects so as to give them heightened visual interest by means of shape, color, or line. When emphasizing “meaning,” we require an art object to have referential content (which may in itself be captivating). Artistic behavior then refers to such activities as drawing, painting, sculpting, or otherwise creating visual stimuli that evoke perceptual and/or semantic referents—a bird, a deity, the concept of ten, and so on—in a human beholder. Clearly the boundaries between these two analytical sets of activities are often hard, if not impossible, to establish, as when modifying the human body’s appearance implies both aesthetic effects and signals social status, or when a visual representation of a deity is made to look as handsome, or as fearsome, as possible.

From around 1.4 million years ago onward, early humans started to produce a new type of stone tool, the so-called hand ax. By 500,000 to 400,000 years ago, some of these pear-shaped artifacts displayed a striking symmetry, both en face and in profile. Although the imposed symmetry allowed the object to sit comfortably in the hand, some scholars argue that the symmetrical design went beyond utilitarian requirements and introduced an aesthetic element. In addition, the material from which these exquisitely crafted objects were made seems to have been carefully chosen, partly for its visual effect (often glistening stone, exceptionally with a fossil in the middle of the finished product). Although we will never be sure of the impact these objects had on contemporary viewers, the symmetrical hand axes may have been the first material evidence of the human tendency to create objects that command attention through their visual qualities.

These hand axes, however, were already disappearing from the archaeological record when “anatomically modern humans” arose in Africa some 200,000 years ago. The creation and use of art is especially associated with this new species, *Homo sapiens*. Nonetheless, until very recently research suggested that we had to wait until some 30,000 years ago before modern humans became involved with “art and personal ornamentation” after arriving in Europe. New evidence continues to revise this picture considerably.

Finds from the Blombos Cave

Recent finds from Blombos Cave, a coastal site at the southernmost strip of the African continent, are central to present-day discussions on early artistic behavior. Excavations led by Christopher Henshilwood have yielded, among other things, a piece of flattened ochre showing cross-hatched marks that appear to be framed by incised lines. When the finding was announced in late 2001—the engraved Blombos piece dated to about 75,000 years ago—archaeologists considered it the earliest unquestionable example of a human-made geometric pattern known so far. Its

discovery led to considerable attention in the popular press. Newspaper headings hailed the Blombos ochre as “the world’s oldest art object,” and it was claimed that because of this find “art history doubles”—an assertion referring to figurative cave paintings of Chauvet in southern France, estimated to be some 32,000 years old. Meanwhile in 2009, findings were published about additional engraved pieces of ochre from Blombos, the oldest dating to some 100,000 years ago.

We do not know whether the geometric patterns from Blombos were created to please the eye. Scholars observe, however, that in order to make sense of their visual environment, humans long ago evolved to become sensitive to such features as straight lines and repetitive patterns. Purified versions of such geometric features would then hyper-stimulate the brain and increase the pleasure that follows the detection of visual regularity. The brain’s innate response to visual patterning might then shed light on why humans started creating geometric designs, once the prerequisite motor and mental capacities had developed.

Some scholars, however, see the geometric patterns from Blombos predominantly in terms of symbolism, as a form of an intentional visual referencing that would represent a major step in human cognitive evolution, especially if the relationship between signifier and signified is established on a conventional or arbitrary basis (that is, when it is “purely symbolic”). Although what the designs might refer to remains unclear, this symbolism would demonstrate that the Blombos people were capable of “abstract thought,” and that they were able to store, as well as retrieve, information outside the brain. The mental capacities involved are in themselves often held to presuppose the existence of syntactical language, not so much because it is similarly symbolic but rather because language would be required to establish link between the engraving and its stipulated meaning.

Adherents of a symbolic reading of the Blombos ochre also draw attention to another find in the cave: some forty deliberately perforated estuarine shells (*Nassarius kraussianus*) that show signs of having been strung and worn as beads. Archaeologists,

inspired by studies in ethnography, almost universally regard such beads as symbolic and emphasize their social role in signifying individual and collective identities. Beads may signal the wearer's age, kin group, marital status, and so on, thus visually marking and accentuating social differentiations.

When the discovery of the Blombos shells was first announced in 2004, it was considered as spectacular as that of the ochre, in that generally the perforated shells, likewise dated to 75,000 years ago, were held to have almost doubled the age for human bead production. This led to claims that the Blombos beads were too anomalous to allow significant conclusions to be drawn about human behavior during the time period concerned. Meanwhile, deliberately perforated shells, some of which are ochered, have been discovered in a cave in Taforalt, Morocco, and they have been firmly dated to some 82,000 years ago. Excavations in the cave continue with findings of shell beads that are 86,000 years old. A few other perforated shells from northern Africa and adjacent parts may even be older. Interestingly, all these beads are made from *Nassarius* shell, as are the Blombos beads from southern Africa, and they were found up to 200 kilometers (about 124 miles) from the sea, implying transport and probably exchange or trade.

Although archaeologists consider beads to be symbolic, in describing their probable use in necklaces they do use terms like “ornament” or “decoration,” implying that the wearing of beads also had an aesthetic effect. Indeed, the shells used as beads in Paleolithic contexts exhibit visual qualities such as bright color and luminosity. A repetitive pattern emerges when similar-sized beads are strung together; alternation of color might add to the pattern as well. Aesthetic and symbolic functions do not rule each other out, and may in fact be mutually strengthening.

Individuals who managed to secure particular types of shell and were dexterous enough to make them into beads by means of perforation—a feat not easily accomplished by present-day experimenters—may have worn these precious possessions themselves, as a form of visual display demonstrating self-awareness. They might also have presented them to others, for

The anthropomorphic symbolism in a Venus figurine suggests a cryptogram combining female breasts with a male penis and testicles. Archeologists are uncertain about the function of these figures, whether as fertility symbols or early forms of pornography.

example in the context of courtship; beads could as well have been instrumental in creating and maintaining intergroup contacts. If worldwide practices today are anything to go by, the wearing of shells or other pendants might also have early acquired a protective function, or served as a talisman to bring good luck.

As do some older perforated shells, four of the Blombos beads show traces of red ochre, a possible result of deliberate coloring or perhaps due to the shells having been worn on ochered bodies. Ochre is found in large quantities at African archaeological sites associated with anatomically modern humans, although its first use predates the arrival of *Homo sapiens* by at least tens of thousands of years. Some pieces of ochre have clearly been rubbed against surfaces. Research suggests that ochre might have been used for preparing hides, for medicinal reasons, or as an adhesive. Many archaeologists make a more popular “symbolic” interpretation, however, assuming that ochre was applied especially to human bodies in ritual contexts. Although this interpretation is

Carving of a running lion in ivory, excavated from Pavlov (Czech Republic), a site that reveals the hunting and tool-making skills of its Upper Paleolithic-period inhabitants.

mainly based on contested parallels with present-day hunter-gatherers, ochre is likely to have had some “significance” for early modern humans; its use in burials, for example, is attested from 100,000 years ago onward.

Iconic Representation

The application of ochre to surfaces would at some point also result in geometric and figurative images. Figurative imagery brings us to a subject that some call “iconic representation”: the two- or three-dimensional rendering of humans and other animals, or, to be more precise, the representation of things resembling those in the external (or imaginary) world(s)—fauna especially, but also flora, topographical features, built environments, and other human-made objects.

Specialists seem to agree that producing and perceiving three-dimensional figurative images takes less exacting cognitive ability than creating and making sense of two-dimensional iconic depictions. To understand such phenomena, consider what we presently know about the first human creation of figurative or

iconic images in the round: as yet no unambiguous evidence exists that early modern humans in Africa produced three-dimensional figurative imagery, although the few indications we do have give some credence to the speculation that they might have done so using such perishable, nonrecovered, but more easily modified media such as mud or vegetal materials including wood. Similarly for this period, we lack information on any ephemeral forms of modifying the body’s appearance, involving, say, flowers, feathers, and plaited fibers (but also hairdressing), or about such possible practices as drawing in, and perhaps with, sand.

Two controversial modified stone objects can serve as examples of early iconic representation, both dating, in fact, to before the arrival of the anatomically modern humans we presently conceive. One is an object discovered near the Moroccan town of Tan Tan, found in layers that are provisionally dated to between 500,000 and 300,000 years ago. The so-called Tan Tan figurine is a small stone whose natural shape resembles that of a human being. Some of the object’s natural grooves, which are in part responsible for its anthropomorphic appearance (e.g., a groove

separating the “legs”), seem to have been accentuated artificially in what is interpreted as an attempt to enhance the human semblance. Interestingly, red pigment appears to have been applied to the object’s surface. The second, the “Berekhat Ram figurine” found in present-day Israel in an archaeological context dated to 233,000 years ago, presents a similar but even more contentious case of semi- or proto-sculptural activity.

Exceptional and controversial as these objects may be, they indicate that hominids have long been capable of discerning human features in natural objects. The oldest specimen to-date is a naturally weathered pebble resembling a hominid face that was found at a three-million-year-old occupation site in Makapansgat in South Africa, probably having been brought there from a nearby riverbed. Given humans’ evolved sensitivity to the visual appearance of the human body, particularly when choosing a mate, it is not all that surprising that their increasing capability to modify materials eventually led to the further elaboration of objects bearing a natural resemblance to human features. The late arrival in hominid evolution of this type of behavior, however, should warn us not to think too lightly of the combined capacities involved.

Natural objects suggesting the shapes and outlines of animals, such as cave walls, appear to have held a similar appeal. Apart from European cave paintings, we may rely for evidence here on a 2006 report about a large piece of rock found in a cave in the Tsodilo Hills in Botswana that resembles the body and head of a python. The surface of the rock shows hundreds of artificial indentations that might have been applied to evoke a snake’s scales. The indentations appear to have been made by stone tools excavated in the cave, and which are provisionally dated to more than 70,000 years ago.

“Out of Africa”

Somewhere between perhaps 80,000 and 60,000 years ago, modern humans left Africa to colonize the rest of the world (where they would gradually replace

earlier humans, such as *Homo neanderthalensis* in Europe and descendants of *Homo erectus* in Asia). Following a coastal trajectory, groups of humans are likely to have migrated along the present-day Arabian peninsula via India to Southeast Asia and on to Australia, a continent that in all likelihood had not yet been populated by hominids. Other migrants, at some point turning north, would colonize Eurasia, following river courses at first.

In Australia, where modern humans arrived perhaps some 50,000 ago, shell beads in all likelihood continued to be worn, with the oldest finds so far including perforated shells that are dated to more than 30,000 years ago. From around this time we also have burials containing human bones covered with ochre. Red ochre was used as well for what is claimed to be the oldest evidence for rock painting in the world today: a piece of rock painted with ochre, found in Kimberley, in northwestern Australia, a region famous for its rock paintings, and dated to around 40,000 years ago.

Is this indeed the first evidence we have of humans applying paint to rock? If so, could this mean such activity developed only after modern humans had left Africa? Africa’s oldest paintings yet discovered were found in a cave in Namibia, where images of animals appear on slabs of rock. The paintings are traditionally dated to approximately 28,000 years ago. Recent scholarship suggests, however, that the images may in effect be some 60,000 years old. If so, this increases the possibility that Africa is the birthplace of two-dimensional figurative imagery. This would suggest in turn that the ability to produce such imagery might have been part of the neurocognitive (although not necessarily behavioral) repertoire of modern humans moving out of Africa.

For the oldest indisputable examples of three-dimensional imagery discovered so far we must turn to western Eurasia. Recent excavations of the earliest levels at the site of Kostenki, on the river Don in present-day Russia, suggest that modern humans first arrived in this part of the world at least 45,000 years ago. The excavations have yielded shell beads and a worked piece of mammoth ivory that may represent

a human head. Less ambiguous are recent finds from Vogelherd in southwestern Germany, including a small ivory figure of a woolly mammoth and an animal interpreted as a lion. The figures date to between 38,000 and 32,000 years ago. From roughly the same period are the figures that were discovered a few years back in Hohle Fels cave, also in southwestern Germany. Here archaeologists dug up three small ivory carvings: the oldest known representation of a bird, the head of an animal resembling a horse, and a sculpture interpreted as therianthrop (combining feline and human traits), which is compared to the roughly contemporaneous, but much larger figure known as the “Lion Human” from Hohlenstein Stadel, found in 1939.

Until very recently, the so-called Venus figurines from Upper Paleolithic Europe, typically representing corpulent or obese women, were thought to be a somewhat more recent phenomenon, with the most famous example, found in Willendorf in 1908, being dated to about 25,000 years ago; this limestone figure, fitting in the palm of a hand, is covered with red ochre. In 2009, however, archaeologists announced the finding of an ivory figure of a headless woman, with large breasts and buttocks, that was made at least 35,000 years ago and that might in fact be several millennia older. This figure, from the oldest level of Hohle Fels Cave, is considered the earliest incontestable representation of a human body known to date. The function and meaning of the “Venus figurines” remains unknown, with speculations ranging from fertility symbols to early forms of pornography.

Like their relatives who migrated to Australia, the newly arrived modern humans in Europe not only made shell beads (as well as other beads and pendants) but their activities included engraving and painting images on rock. Depictions of animals and geometric designs found in Chauvet Cave in southern France, the earliest of which are assumed to be some 32,000 years old (which makes them roughly twice as old as the famous examples of Lascaux and Altamira), attest to this, as do other findings. Until the early years of the twentieth-first century, Europe was in fact considered the cradle of human artistic

behavior, with scholars employing such expressions as “creative explosion” for what was regarded as the sudden advent of bead making, painting, and sculpture in this region some 30,000 years ago.

Farther afield, in the site at Mal'ta, to the west of Lake Baikal in Siberia, archaeologists found ivory sculptures depicting the human form and birds, which are estimated to be some 23,000 years old. The majority of the anthropomorphic figures seem to represent women, some wearing clothing. Most of the avian sculptures depict birds in flight (they are interpreted as swans, geese, and ducks). Like some of the human figures, they are perforated. By analogy with nineteenth- and twentieth-century Siberian hunter-gatherer practices, the perforated sculptures have been interpreted as “spirit helpers” that were attached to a shaman's costume.

Interpreting Paleolithic Art

Other Paleolithic art forms, too, are today interpreted in the context of shamanism, with special reference to David Lewis-Williams' intriguing theory on the beginnings of human image making. The research published in his *The Mind in the Cave: Consciousness and the Origins of Art* (2002) suggests that the images characteristic of Paleolithic art, namely animals and geometric designs, find their origin in hallucinations or “altered states of consciousness,” especially as experienced by “shamans” in a state of trance (induced by ritual, sensory deprivation, or psychotropic drugs), and thus that the first human images were created to “fix” shamans' hallucinatory experiences.

In proposing his theory, Lewis-Williams draws on shamanistic practices found today in hunter-gatherer societies all over the world. He argues that present-day humans have basically the same brains as their Paleolithic ancestors tens of thousands of years ago. Now when we perceive the world it is ultimately the brain that generates the images we experience. The brain may in fact produce images even in the absence of external visual stimuli, as in mental visualization and perhaps more vividly in dreams or other altered states of consciousness (but also, for example, when

This mammoth, one of the world's earliest ceramic figurines, was also found at Pavlov (Czech Republic).

one slightly pushes the eyeball, resulting in the visual experience of various geometric or abstract shapes in different colors, something experienced more intensely by people suffering from migraine).

Research also suggests that images, specifically of animals, which were generated and experienced by the brain in trance-like conditions, would have been interpreted as pertaining to phenomena existing on another plane, as glimpses or visions of beings that populated “alternative realities.” Indeed, Lewis-Williams argues that the modern human brain is not only able to self-generate images, but it is also able to remember these and to share and discuss them with others through both verbal language and the visual images that serve as records of what shamans powerfully experienced when sojourning in “other realms.”

Shamanistic rituals can involve not only experiencing spirits in the form of animals, but the shaman's transformation into such a spirit being. This might shed light on the occurrence of therianthrope images in Paleolithic art. Some researchers object to such a theory, however, saying that not all artifacts

interpreted as therianthrope represent actual mixtures of humans and other animals: the so-called Lion Human of Hohlenstein Stadel, for example, might as well be a depiction of a bear standing upright. Furthermore, some of these images, which are said to be actually quite rare, may in fact render a human in disguise, pretending to be an animal in the context of the hunt. But scholars also argue that the scientific literature on hallucination is less supportive of Lewis-Williams' neuropsychological theory than suggested.

R. Dale Guthrie, a specialist in Arctic biology, presents an alternative account of Upper Paleolithic art but does not, however, address the preconditions or origins of human image making. Guthrie, focusing on Ice Age Europe, proposes that the images of animals on cave walls, but also on portable objects, result from their creators' fascination with the local wildlife. Countering the prevailing “magico-religious paradigm” in prehistoric art research, Guthrie posits that many images might in fact have been made by male adolescents who were inspired by what he calls “testosterone moments,” such as the excitement of the

This illustration of a drawing incised on a cave wall in southern France shows salmon and huge-antlered stags embellished with line patterns and cross-hatching.

hunt or the confrontation with large predators. This profane perspective on Paleolithic art making is also deployed to elucidate the sexual imagery frequently found in cave paintings, rock engravings, and other artistic expressions. Featuring mainly women and female sexual organs, this prehistoric “graffiti” could present young men’s sexual fantasies or experiences. Guthrie’s views share elements with the interpretation developed by John Onians, who bases his analysis on recent neuroscientific findings.

Paleolithic art has always been and continues to be a fascinating field of competing interpretative theories. One currently debated topic concerns the question of whether or not early art forms had an “adaptive function,” meaning whether or not artistic behavior contributed to the survival and reproduction of those who practiced it. Could it be that, once having come into existence, the tendency to create visual art was able to spread because it turned out to confer some evolutionary advantage on individuals or groups so inclined? Among the proponents of an adaptionist perspective on art, a distinction may be made between those who favor an explanation of art’s role in the competition among individuals (specifically for mates, in which case art would serve as a way

of showing off one’s skill and creativity) and those who argue for the social benefits of art’s presence, such as its effects on group solidarity, cooperation, and the intergenerational transmission of knowledge (for example, by making messages more memorable). Scholars who deny that visual art may be assigned an adaptive value suggest that it evolved as a byproduct of capacities and tendencies that in themselves are probably adaptive, such as the ability to create and manipulate tools and the positive innate responses to certain colors, lines, shapes, and subject matters that better helped humans to survive and reproduce.

The Future of Paleolithic Art Studies

After decades of relative neglect, Paleolithic art and the concomitant issue of the origins of art are today hotly debated by specialists from an ever-growing range of disciplines, including archaeology, art history, and anthropology, as well as evolutionary biology and neuroscience. While new archaeological discoveries are being published at an increasing rate, this interdisciplinary group of scholars is bringing new conceptual tools, interpretative frameworks, and research methods to bear on a fundamental set of

Where the spirit does not work with the hand there is no art. • Leonardo da Vinci

questions in world history: when and where did human beings begin making and using visual art, what conditions made this behavior possible (physical, mental, social, cultural), why has this artistic behavior been retained in human history, and how has art increasingly become integral to our existence?

Art—Pre-Columbian Central and South America

The arts of Central and South America created prior to the arrival of Europeans in the 1500s represent the development of many sophisticated civilizations, some of which still exist. Although countless changes occurred after the European conquest, many indigenous philosophies, cultures, and customs did not vanish; rather, people of the Americas found ways to combine aspects of old and new, especially in their art and architecture.

Before the late fifteenth- early sixteenth-century European conquest of Central and South America, indigenous peoples—such as the Inca, Maya, Mixtec, Aztec/Mexica, and Zapotec—had developed art and architecture with distinctive characteristics. Many artifacts exist to inform world historians and researchers studying those civilizations, and scholars continue to excavate, analyze, and publicize the remains of ostensibly vanished cultures. Native Americans and mestizos (those of mixed Native American and European ancestry) continue to spur discussion and exploration of pre-Columbian cultures, and to revive an indigenous past that formerly was suppressed or hidden during the colonial era.

Pre-Columbian Art: Overview

Although artistic traditions in the Americas continued long after the arrival of Europeans, the end of the pre-Columbian period in the Caribbean is marked by 1492, the year in which Christopher Columbus came to the Antilles. In the highlands of Mexico, pre-Columbian art is generally dated prior to 1521, the year in which the conquistador Hernán Cortés and

his allies conquered the Aztec/Mexica capital Tenochtitlán. Francisco Pizarro's 1533 conquest of the Inca capital Cuzco, Peru, ends the pre-Columbian creation of art in South America.

The exchange of art and ideas occurred across vast distances and influenced widely disbursed groups in the Americas; sometimes art materials were brought from afar to satisfy philosophical, spiritual, political, and aesthetic needs. Much extant pre-Columbian art is made of durable stone, metal, stucco, or clay, but the people of the Americas created goods for home and trade using materials as varied as amaranth seeds, animal hide, bark paper, bone, cotton, feathers (especially the quetzal's), gold, greenstone, jade, mineral and vegetal paint, pearls, shells, silver, turquoise, wood, wool, and yucca. Public and semipublic monuments communicated messages asserting the legitimacy of the right to rule; they commemorated conquests of polities and foes, celebrated the histories and awe-inducing qualities of gods, and informed successive generations about historical and mythological events. Thus, art in the ancient Americas transmitted much more than ideas about beauty.

Although the Americas comprised various ethnic groups and city-states, they shared similar beliefs (pan-American bird-feline-lizard religion; rain or lightning gods), cultural practices (patronage and trade; sacred architecture; art used in rituals and ceremonies), and motifs (preference for abstraction; substantial use of red pigments; accordion-style record books). Historians once accounted for these similarities in Mesoamerica by theorizing that the Olmec (c. 1500–550 BCE) established norms that successors followed, but today they believe cultures such as the Zapotec may be nearly as ancient. As for South

American indigenous peoples, scholars believe they maintained the customs, aesthetics, and culture of the Chavín (c. 800–200 BCE) of the Andes. Recurrent themes also abound in pre-Columbian South American art and architecture: food and agriculture; gods and rulers; sacrificial rituals; sexuality and fertility; and symbols of wealth and status.

Most surviving pre-Columbian art emphasizes contour line, pattern, and hieratic scale (the depiction of more important figures as larger than others in the scene). Artists, apparently suffering from *horror vacui* (literally, the fear of empty spaces), filled the entire composition with images, glyphs, or repeated motifs. They preferred composite perspective for figures, a style comparable to Egyptian art in which arms and legs appear in profile while the torso is frontal. Pre-Columbian art rarely, if at all, used perspectival systems to create illusions of the realistic world humans inhabited. These practices were the product of aesthetics, not a lack of technique: oral histories, documents, and material evidence indicate that pre-Columbian artists were extensively trained.

This survey takes a geographical approach to the settlements of the pre-Columbian period, starting in ancient Mesoamerica with the Olmec and ending in the Andean cultures of South America.

Mesoamerica: Pyramids, Ceramics, and Ball Courts

Ancient Mesoamerica, the region that encompassed present-day central Mexico, Guatemala, and Honduras, included numerous settlements and cities populated by various indigenous people who shared specific religious and aesthetic philosophies—and who documented sociocultural structures and practices in their art.

Olmec

Once called the “mother culture” of Mesoamerica, the Olmec settled along the Gulf of Mexico in the areas now known as Vera Cruz and Tabasco as early as 1500 BCE and continuing through 550 BCE. Data

accumulated since the late 1990s, however, suggest that other groups, such as the Zapotecs of southwest Mexico, may have origins stretching back that far. The Olmec were not homogenous or static while they flourished; archaeologists have found Olmec art several hundred kilometers from their gulf-coast centers.

The Olmec developed a complex calendrical system and demonstrated an interest in writing. Glyphs found at La Venta and on the Cascajal Block (a writing tablet-sized slab dating to the first millennium BCE and discovered in Veracruz), may be the earliest example of writing in North and South America. Archaeological evidence in sites at San Lorenzo (flourished 1200–900 BCE) and La Venta (900–400 BCE)—including clay and stone architecture, monumental and small-scale sculptures, bas-reliefs, and decorative ceramics—suggests a sophisticated, well-developed civilization with an interest in agriculture, aquatic and amphibious life-forms, leadership traditions, and status. Ceramics and small stone carvings, exchanged along

extensive economic trade routes from about 1150 to 900 BCE, likely influenced artwork in the Mexican highlands, where large Olmec-style petroglyphs and pictographs have been found in caves. From about 900 to 550 BCE, the Olmec traded carved jade, usually in the forms of celts (chisels) or axes. Artists incised anthropomorphic and animal features—most notably of snarling, jaguar-like creatures, reflecting the belief that jaguar deities could assume human form—into jade, later rubbing red-brown cinnabar (mercury sulfide) into the lines. (The poisonous cinnabar signified a kind of untouchable sanctity to the works.) Frowning, puffy-faced, carved figures—some referred to as the “were-baby” or “jaguar-were-baby”—pervade Olmec art. Scholars suggest the were-baby was symbolic in the transmission of power from one ruler to another, or served as a representation of the origin of power in the Olmec tradition.

The Olmec transported huge pieces of basalt some 96 kilometers from the Tuxtla Mountains to build a portion of the 30-meter-high Great Pyramid in La Venta. (The structure, estimated to have taken 18,000 men about a million man-hours to construct, has been noted for its similarities, including its north-

south axial orientation, to the great Egyptian pyramids. The best-known examples of Olmec sculpture, sacrificial offerings in the form of colossal heads, likely represented individual rulers; while they all exhibit fleshy faces, almond-shaped eyes, and downturned mouths, each face is different. The Olmec sacrificed items, such as statuary configurations and mosaic floors, by burying or somehow hiding them from public view after completion (again, a striking similarity to the Egyptians). The pre-Columbian art scholar Mary Ellen Miller has called this type of offering *hidden architecture*.

The Olmec built ball courts and played the Mesoamerican ballgame, a political-religious, culture-defining ritual of pre-Columbian societies, especially the Maya, that persisted until the time of the conquest. On a slope-walled, I-shaped court, heavily padded players used their arms, hips, shoulders, and torso—but not hands—to hit an approximately 4-kilogram rubber ball through small raised goals. Small ceramics depicting ball players and spectators have been found in southwestern Mexico. Some scholars suggest that the ball represented celestial bodies held aloft by the players’ skill.

Characteristics distinctive to Olmec—the colossal head, the use of red pigment as a means of expression, jaguar or feather headgear, and deity masks—influenced later cultural groups well beyond the third century CE.

Maya

The Maya, scattered like the Olmec, were located in southern Mexico, Belize, El Salvador, Guatemala, and Honduras; their stratified society engaged in farming, hunting, masonry, and trade. Distinctively Maya centers emerged circa 300 BCE and endured until the time of the conquest. Some Maya edifices, such as the Temple of the Cross and Temple XIX at Palenque, have deteriorated significantly, while other artifacts remain subsumed by jungle or buried beneath earth.

The Maya kept their historical documents in codices (accordion-style record books). They did, however, maintain an oral history tradition in such collections as the *Popol Vuh*, written down in the sixteenth-century by a Maya noble; it details the adventures of Hero Twins who attempt to defeat the gods of the underworld and resurrect their father.

Many Mayan ceramics depict scenes from the *Popol Vuh*: the renowned Blom Plate, for instance, illustrates the twins using blowguns to shoot a boastful macaw that wrongly claims to have created the sun and moon.

Gods, sacrificial victims, and rulers appear repeatedly in Mayan art. Deities comprised of body parts from more than one animal are shown with humanoid hands, legs, and heads. Sacrificial victims are usually depicted as nude or semi-nude, to the Maya a condition of shame. The Maya practiced ancestor worship, burying the dead with the tools of their professions, cremating or interring the remains of royalty, and, later, building temples and tombs to honor them. Stelae honoring current and departed rulers included dates and symbols of their accomplishments.

The Maya continued to refine the 260-day ritual calendar, establishing the “long count” of days since the beginning of time, which they believed to be 3114 BCE. Twentieth-century scholars who discovered that glyphs appearing in Mayan iconography were often numeric notations from this calendrical system were able to discredit the prevailing view of

In this mural at Teotihuacán the puma's claws are drawn with characteristic, cartoon-like exaggeration.
Photo by Danielle L. Pierce.

the Maya as peaceful philosopher-kings. Evidence is in the art: Mayan glyphs, frescoes, relief carvings, and wall panels suggest that bloody conflicts and sacrifices existed throughout known Mayan history—and that political posturing, war, and human sacrifice, in addition to agricultural and environmental factors, may have contributed to the decline of populous Mayan settlements circa 800–900 CE. The Maya lived in less populated, more decentralized settlements at the time of the Spanish conquest.

Zapotec

The Zapotec civilization, which established its earliest settlements in Oaxaca, Guerrero, and Puebla, may have existed somewhat concurrently with the Olmec, although for a longer period. At the time of the conquest, Zapotecs engaged in trade across central Mexico but did not dominate the region like Mixtecs or Mexica.

The Zapotecs maintained a pantheon of gods, a 260-day ritual calendar, a priest-scribe class, and a belief in a universal life force called *pè*. The visage of Cocijo, their god of lightning, appears on many complex ceramic pieces from Oaxaca. Scholars suggest that the Zapotecs' militaristic society created arts

and temple architecture to connote power and status and to revere ancestors, especially previous rulers. (From about 200 to 1000 CE the Zapotecs built large mounds and structures over older structures, as did the Maya.) Relief carvings in the city of Monte Albán (built 300–200 BCE and declined 200 CE) depicted named, sacrificed captives in varying levels of mutilation. In Tomb 7 at Monte Albán, archaeologists discovered collars with golden beads shaped to resemble jaguar teeth and turtle carapaces, personal adornments (including labret plugs, i.e., decorative status items that enter below the lower lip inside the mouth and project outward away from the face), ceramic urns, and incense burners.

Teotihuacán

Teotihuacán, established during the beginning of the first century CE about 48 kilometers from present-day Mexico City, flourished from 350 to 600 as one of the world's largest cities (population c. 200,000). Residents worshipped the Rain God and the Feather God (Quetzacoatl), recognizably antecedent to gods of later Mesoamericans. The city's ceremonial center burned in the eighth century; thereafter Teotihuacán declined but remained a pilgrimage center until the conquest. The Mexica, who then predominated and gave the city its name, believed the site to be the place where gods created the sun and the moon. (Teotihuacán means "The City [gathering place] of the Gods.")

The Avenue of the Dead forms a 5-kilometer north-south axis through the city beginning in front of the Pyramid of the Moon. Multiple, symmetrically arranged residences, temples, and open courts flank the road, which then passes, on the left, the dual stairway of the Pyramid of the Sun. Continuing south, in the heart of the city, the avenue leads to the Cuidadela (Citadel), a vast sunken plaza whose focal point is a six-platform step pyramid, the Temple of the Feathered Serpent. The temple structure exhibits a hallmark of Teotihuacán *talud-tablero* style: each sloping base (*talud*) supports a vertical entablature that is surrounded by a frame and filled with sculptural decoration.

Pyramid of the Moon in Teotihuacán, where the Mexica believed the gods created the sun and the moon. Photo by Danielle L. Pierce.

Teotihuacán murals exhibit easy-to-understand, cartoon-like line drawings in which elements of color and style can be read symbolically. The jade green nose adornment, headdress feathers, and beads of the Great Goddess of Tetitla (Teotihuacán) denote spiritual wealth and the sustenance it provides. The repeated C curls and lines attached to her hands represent abundance and flowing water.

Archeological evidence of human and animal artifacts buried with precious jade figurines, adornments, and obsidian suggest that the Teotihuacáños engaged in sacrificial practices; evidence of sacrificial rituals appears in Teotihuacán art. A fragment of a mural called *Maguey Bloodletting Ritual* (600–750 CE, Cleveland Museum of Art) shows a priest piercing

his hand on the spine of a maguey plant—a source of food and fiber (for fabric, rope, and paper), as well as a sacramental drink. The priest then scatters his blood on seeded, rectangular plots of earth.

Mixtec

The Mixtec settled between 1500 and 750 BCE in Oaxaca, Guerrero, and Puebla, where they became powerful circa 900 CE. Mixtec culture continued to develop somewhat concurrently beside the Mexica, who conquered several Mixtec city-states during the 1400s and early 1500s, exacting tribute from the conquered villages. The Mixtec used alliances created through marriage to determine the inheritance

of titles and the right of rule. Spaniards later came to rely on this elite ruling class to aid in conversion and cultural changes.

Scholars have labeled extant codices, jewelry, and ceramics as Mixteca-Puebla, a style that emphasized the planar qualities of a figure and object by outlining and filling the image with flat, consistent earth tones and eschewing realistic representation for economical stylization.

Aztec/Mexica

At the time of the conquests, Nahuatl-speaking peoples who called themselves Mexica, not Aztec, were the dominant power and culture in Mesoamerica. (The name “Aztec” only became popular when scholars in the nineteenth century adopted it as a way to distance “modern” Mexicans from pre-conquest Mexicans.) The Mexica controlled a vast empire spanning central Mexico from the gulf to the Pacific, an accomplishment achieved through military campaigns, marriage alliances, an education system for elite males, and control of trade networks.

The Mexica developed communities as early as 950 CE in central Mexico; they built portions of their capitol Tenochtitlán, where Mexico City stands now, as early as the twelfth century, constructing it on islands in Lake Texcoco that were built up from debris. One renowned Mexica myth, now part of modern Mexican national identity, describes the peoples’ origins on an “island of whiteness” (Aztlán). The hummingbird god Huitzilopochtli directed them to leave Aztlan and travel until they saw an eagle, perched on a prickly pear cactus, gobbling a snake—and there to build their new home. After Mexico won independence from Spain in the late 1880s, leaders evoked images of the Mexica past to inspire the future: Mexico’s coat of arms depicted an eagle clutching a snake in its beak, and symbols from Mexica carvings began to appear on postage stamps. In the 1920s, when Mexico’s education minister invited artists including Diego Rivera and José Clemente Orozco to paint murals on public buildings to commemorate those who fought in the revolution, many painters drew upon

Mexica mythology and symbols. For Rivera, the Earth goddess Coatlicue (Huitzilopochtli’s mother) was an especially iconic image.

Scribes recorded details of Mexica history, religion, and culture in codices—the pre-Columbianist Elizabeth Boone calls them “containers of knowledge”—by using glyphs that represented components of words, ideas, names, and dates and by arranging them in “scenes” with symbolic, interpretative clues. Very few of these books exist today. The Mexica king Itzcoatl became notorious (in part) for rewriting or destroying these historical chronicles when he came to the throne in 1428. After installing the first bishop in Tenochtitlán in 1528, Spaniards also embarked on a campaign to destroy indigenous records.

The main temple of the Mexica Empire, the Templo Mayor, held dual shrines, one dedicated to Huitzilopochtli and the other to the rain god Tlaloc. Excavations revealed a cave and offerings below the pyramid, as well as artworks depicting Mexica origin myths. The Coyolxauhqui disk, for example, illustrates the dismemberment of Huitzilopochtli’s traitorous sister, who attempted to kill their mother, Coatlicue (“she of the serpent skirt”), after learning of their mother’s pregnancy.

The Mexica first fell to Hernán Cortes in 1519 and suffered a final defeat in 1521. On 22 October 1522, Holy Roman Emperor Charles I (V) declared Cortés Governor and Captain General of New Spain. Over the next several years, Spanish forces subdued much of the rest of Mexico and established it as a colony.

South America: Textiles before Ceramics

Ancient peoples of the Peruvian Andes developed textile technology before ceramic technology. Woven items dating from the ninth to the sixth centuries BCE found in Guitarrero Cave are the oldest artifacts from the continent, and archaeologists discovered mummies wearing intricate textile designs from as early as 5,000 BCE at Huaca Prieta. The high grasslands of the Andes—the habitat of llamas, alpacas, vicuñas, and guanacos (all a rich source of wool)—made the creation

of textiles in South America a flourishing art form. Textiles designed by artists for private use reflected a measure of ethnic, political, and social status. Textiles in Andean public life assumed the significance equal to ceramics in Mesoamerican ritual sacrifices and bronze in Chinese ancestor worship—and yet relatively few textiles, at least compared to in number to their durable clay and metal counterparts, exist in the archaeological record.

Early South American Origins

In the central Andes of South America (present-day Peru and Bolivia) civilizations developed, as they did in Mesoamerica, with rich and varied artistic traditions, but in the midst of a more dramatic geography—dry desert between the Pacific and the snow-capped peaks, highland grasses (home to the Andean camelids), and steep slopes that descended on the east to the rainforest of the Amazon Basin. The earliest ceremonial mounds and plazas on the coast date to the third millennium BCE, the same period as the earliest pyramids in Egypt. Multi-room stone structures in the highlands featured sunken fire pits that were used to burn ritual offerings. During the second millennium BCE, prior to the settlement of Chavín de Huantár, coastal peoples became more dependent on agriculture, and thus began to build canal and irrigation systems. A distinct style of architecture emerged as populations moved inland: large, U-shaped ceremonial structures, with sunken, circular spaces, were oriented toward the mountains, the rising sun, and the source of the water they needed to grow food.

Chavín

The people who populated Chavín de Huantár (c. 900–200 BCE), a settlement located on a trade route through the mountains that connected the Pacific Coast and the Amazon Basin, were influential in South America for centuries.

The Chavín incorporated influences from earlier surrounding peoples, appropriating the U-shaped buildings of the coastal regions and the recessed spaces of South American highland structures to create a uniquely Chavín aesthetic.

Archaeologists have found golden objects, ceramics, and textiles produced by the Chavín far north and west of the mountain pass, an indication of their complex trade network. Artisans produced gold and gold alloy sheet-metal adornments, headgear, pectorals (chest pieces worn by elite men), and ceramic stirrup-spout vessels. The abstract style of Chavín art deals with recurrent motifs and subject matter, especially religion and spiritual transcendence.

Nazca

The residents of Nazca (Nasca), Peru, established their settlement as early as 600 BCE. The adobe pyramid—altered hills made to resemble large structures—burials mounds, plazas, and funerary offerings at Cahuachie are associated with the Nazca.

Chavín textiles and ceramics influenced Nazca weaving and pottery, but the Nazca are best known for transforming the living surface of the Earth to create monumental artworks, called geoglyphs, on the

Pampa de Nazca. The Nazca dug contour lines in the dark gravel of the plains to form gigantic images—a hummingbird, a killer whale, and a monkey, for example—and then they edged the underlying lighter soil they'd exposed with sea and river stones, shells, and ceramics full of corn beer in what scholars believe were fertility or water rituals. Some have posited that the people of Nazca could not have made the geoglyphs themselves—that the makers and intended audience were space aliens. Scholars do agree, however, that early humans were capable of creating such large imagery (and that such endeavors could take place without conscription or slavery). Pre-Columbian art produced only for the eyes of gods is not unusual: the Olmec offered hidden architecture below buildings and under special spaces; the Mexica gave offerings in the layers of the great Templo Mayor.

Moche

The Moche, whose origins are not fully understood, resided in a desert valley in the Andes (north of Chavín de Huantar) from the first century CE to the eighth century; the capital, Cerro Blanco, was located close to an ancient trade route connecting the coast and the edge of the highlands.

Allusions to agricultural and commercial pursuits appear in many Moche artworks. The burial site of the Lord of Sipán, discovered north of the Moche Valley, included a gold and silver collar made from beads representing the peanut (an important source of protein and fat), as well as silver-and-gold-gilded ear spools, masks, textiles, and ceramics. Excavation of the burial site suggests that the Moche were a stratified, militaristic society with a many skilled artisans.

The enormous adobe pyramid at Cerro Blanco, a royal residence known as the Pyramid of the Sun, was made using sun-dried mud bricks, some of which retain the distinctive marks identifying the communities that made them. A second pyramid, the Pyramid of the Moon, was built on a hill, probably as a ritual or ceremonial space. The repetitive building of pyramids in Central and South America suggests a

possible early connection between the two cultures, although the building of such structures could have been independent of each other.

The Moche mass-produced molded ceramics and created one-of-a-kind pieces that were both functional and decorative; such objects displayed naturalism and convincing detail. Scholars believe that vessels portraying rulers were used in rituals and later buried with elites. *Moche Lord with a Feline* (Art Institute of Chicago) is a square vessel on top of which sits a lord, wearing an elaborate headdress with coordinating ear spools, who pets the head of the cat (or jaguar cub) lying next to him. Behind the figure the ceramicist attached a stirrup spout—an upside-down, U-shaped, hollow handle with a single spout protruding from the top—a feature probably appropriated from the Chavín.

Other vessels convey scenes from daily life and sacrificial practices. Some depict food (e.g., corn and beans), deities, flora and fauna, birds, and ocean creatures. Many display sexual imagery, such as prisoners of war with exposed genitalia, or dancing skeletons with erect penises; still others show scenes in which numerous lively figures engage in numerous forms of sexual activity. (Replicas of these so-called Moche sex pots, ubiquitous in marketplaces that target tourists, and are also the subject of considerable anthropological discussion.) Although not much is known about Moche spirituality, several Moche ceramics depict a warrior priest holding a ritual cup, presumably filled with blood or other sacrificial libations.

The arrival of El Niño in the Moche Valley circa 600 CE started the decline of the civilization, and, eventually, the Moche abandoned Cerro Blanco. After the conquest a local river was redirected to flood the site and make it easier to pillage precious objects.

Inca

The Inca developed circa 1100 and by the sixteenth century grew to rule the empire of Tiwantinsuyo, laying stones over the ancient paths that ran from Ecuador to southern Chile. (In the early 1500s its territory rivaled China's in size.) The capital, Cuzco,

As for your pope of whom you speak, he must be mad to speak of giving away countries that do not belong to him. • **Atahualpa, on hearing that in 1493 Pope Alexander VI had awarded parts of Peru to Spanish monarchs**

included ritual routes called *ceque*, lines radiating out from the Qorikancha (Coricancha, or the Temple of the Sun), the city center.

Several versions of the Incas' origin stories are known and referenced in colonial paintings of ancient ancestors. One tells that the Inca believed the incestuous brother/sister husband/wife pair, Manco Capac and Mama Ocllo, received a prophecy about a new homeland in which a golden staff could miraculously penetrate the soil. Eventually they found that place, defeated the people who lived there, and took control of what was to become the center of their empire.

Political systems of the Inca, which required subjects to make tax payments in the form of food, labor, or textiles, and to exchange equal amounts of work among households, fostered advances in textile arts and architecture, two distinctive features of Andean civilizations. Andean textiles are among the most technically complex cloths ever made, some containing five hundred threads per square inch. Making textiles consumed a major part of the human resources of Andean society, whose dyers, weavers, and embroiderers employed and invented nearly every technique known over the centuries. Some cloths, dually appreciated for their beauty and labor intensiveness, were woven, unwoven, and rewoven to achieve special effects. Cotton, grown in Peru as early as 3000 BCE, was the most commonly used plant fiber. The earliest cloths were made without looms, and the techniques of knotting, winding, twining, braiding, and looping continued after the invention of the loom in the early second century BCE. Possessing finely woven cloth conveyed wealth and status; textiles, considered offerings worthy of the gods, were often draped around gold statues. (The conquistadors, of course, kept their sights on the gold). Incan textiles were primarily woven by *acalla*, or female weavers who were under the jurisdiction of state religion. Special administrators called the *quipumacayu* probably tracked such items, in addition to histories, census data, and tribute, with record-keeping systems using *quipus*, knotted and colored cord.

Although the Inca domesticated llamas, these animals could not bear the weight of the monumental

stones used in construction. Thus human labor was necessary for two types of architectural construction: cyclopean masonry and *pirca* (*pirka*) masonry. Cyclopean masonry involved the mortarless configuration of load-bearing walls that were able to withstand destruction from earthquakes endemic to the region. *Pirca* was a load-bearing approach that used mud mortar. Some Incan buildings were constructed of *pirca* walls with a cyclopean masonry façade. A geometric style emphasized basic shapes and lines instead of complex or crowded iconography. Thus Incan builders created other stonework of refinement and durability, such as roads and bridges to link the empire, terraces for growing crops, and irrigation systems essential for supporting a highland population increasingly dependent on agriculture.

When the Europeans arrived, Incan rulership was in dispute. King Huayna Capac died unexpectedly without selecting an heir, leaving his two sons to fight for control of the empire. In 1532 the victorious son Atahualpa fell hostage to Francisco Pizarro, his band of men, and, likely, his Native American allies. After receiving a room full of gold as ransom, Pizarro and his men strangled Atahualpa, appropriating the Incan Empire for the Spanish crown, and took Cuzco in 1533.

Aftermath of the Conquest

Exploitive policies of European conquerors (and ravages of disease they carried, to which indigenous peoples were not immune) caused a sharp decline in native populations in Central and South America. Colonizers suppressed local beliefs and practices, tore down temples, and built churches. Religious conversion fell to Franciscan, Dominican, and Augustinian missionaries, many of whom were appalled by the conquerors' treatment of their subjects.

To some extent, indigenous symbolism was absorbed in Christian iconography, especially in the form of crosses installed in church atriums, where converts gathered to be educated. Missionaries recruited native sculptors to carve these stone crosses, and although the images were likely copied from

illustrated books the missionaries supplied, elements of pre-Hispanic sculpture pervaded. One such sixteenth-century cross (in the Basilica of Guadalupe in Mexico City), carved with dense low-relief images such as Christ's crown of thorns, suggests an ancient Mesoamerican symbol, the World Tree (or Tree of Life), with its stark form and rich surface symbols; the image of blood sacrifice correlates to indigenous beliefs of the Teotihuacán culture, for example, but the newly converted artists who carved it might not yet have experienced the spiritual resonance.

The customs and arts of many indigenous peoples, rather than disappear, mixed with those of their conquerors or survived intact among smaller groups (only to be revived as research in pre-Columbian art piques). While adopting Spanish cultural ideas and practices, the Maya preserved their traditions and language throughout the colonial era, and continue to reside in Chiapas, Mexico, as well as in Belize, Guatemala, and Honduras. Today Zapotecs are concentrated in many southwestern Mexican regions where their ancestors lived. Mixtecos in the twenty-first century are engaged in a revival of their language and pre-Columbian thought and culture, while blockbuster museum exhibits in all things "Aztec" have brought a more nuanced approach to the Mexica. Still-practicing weavers and other textile artists, whose craft has been handed down through centuries, provide a source of pride and world recognition today, as well as a storehouse of information for historians.

Art—Russia

Religious icon painting prevailed in Russia until the European Baroque style surfaced in Moscow in the seventeenth century. With Peter the Great (reigned 1682–1725) came radical change and Russia's ascendance as a European power. From then on Russian artists were both inspired to emulate their Western counterparts and provoked to assert their Russian identity. Contemporary Russian artists continue to experience this dynamic tension in the international art world.

Russian art is far less well known than Russian literature or music, but it has a rich history—both as part of and set apart from European tradition.

Early Russian Religious Art: 1000–1700

The Russian acceptance of Christianity from Orthodox Constantinople around 988 BCE determined the distinctive forms of Russian religious art—churches with cupolas, which later evolved into “onion” domes, and images of Christ, the Virgin Mary, and the saints. Icons, mosaics, and frescoes were windows to heaven, depicting holy persons in their transfigured state, beyond the boundaries of the natural world. Generally icons were unsigned, painted by a collective of artists as an act of worship. Such sacred art, protected from radical innovation by theology, dominated Russian culture for centuries.

Russian icon painters were no doubt inspired by the legendary *Virgin of Vladimir*, a tempera painting brought from Constantinople to Kiev in the twelfth century. It was moved later to the new capital of

Unknown, *Virgin of Vladimir*. Egg tempera on wood. An inspiration to Russian icon painters for its human appeal, the painting was brought from Constantinople to Kiev in the twelfth century.

Vladimir, then to Moscow in 1365, and, because it was reputed to protect those who lived in the city where it was displayed, it remains one of Russia's most revered holy images. More humanized than

Andrei Rublev, *Old Testament Trinity* (c. 1420s). Tempera on wood. The painting depicts three Angels who visited Abraham at the Oak of Mamre; by omitting other figures involved in the biblical narrative, Rublev emphasizes the triune nature of God.

many icons of the Byzantine era, the Mother and Child are shown touching cheeks and gazing tenderly at each other. Russia's most famous icon painter was Andrei Rublev (c. 1360–1430). In his remarkable tempera panel called *Old Testament Trinity* (*Three Angels Visiting Abraham*, c. 1420s?), the angels are harmoniously composed so that their figures form a circle echoed in the shape of their halos.

The Mongol invasion (1237–1240) and occupation, which lasted until 1480, limited Russia's contacts with Western culture without radically influencing its Christian art, although Oriental influences can be detected in applied and decorative art. From the 1470s through the 1490s Italian architects constructed many buildings in Moscow's Kremlin, but the secular art of the Renaissance made little impact. No realistic likeness survives even of Ivan the Terrible (Ivan IV, reigned 1533–1584), although he and other Russian rulers appear in idealized form in religious art.

The seventeenth century is known as an age of transition in Russian culture. Influences entered from Ukraine, annexed to Russia in the 1650s, and from Belarus, both of which, as part of Poland, had experienced Catholic Baroque culture. The ornate style of the later seventeenth century is sometimes known as Moscow Baroque. Some Western European artists and craftsmen entered the czars' service, working in the Kremlin studios, where they contributed to the production of the first stylized portraits of Russian rulers and nobles. The icon *The Tree of the Muscovite State* (1668) by the Moscow artist Simon Ushakov (1626–1686) contains a small portrait of Czar Alexis I (reigned 1645–1676). Ushakov incorporated elements of Western perspective and lighting effects into this and other icons. Alexis's daughter Sophia (1657–1704) was perhaps the first Russian woman to have her portrait painted; generally the segregation of upper-class women from male society created strong resistance to female portraiture.

Eighteenth-Century Cultural Revolution

The modernizing czar Peter the Great (Peter I, reigned 1682–1725) brought radical changes to Russia and made the country a major European power. The showcase for Peter's cultural reforms was his new capital and "window on the West," Saint Petersburg, founded in 1703. Virtually all of Peter's chief artists and architects were foreigners. The Frenchman Louis Caravaque and the German Gottfried Tannhauer painted portraits and battle scenes and helped to train a new generation of Russian secular artists, including the former icon painter Ivan Nikitin (c. 1680–1742?).

Nikitin himself became an iconic figure for a time. His bold and creative approach, which reputedly surpassed his foreign counterparts' unfeeling treatment of Russian subject matter, was especially evident in the expression of grief and loss in the deathbed portrait of Peter attributed to Nikitin, who in fact left behind only two signed canvases. Contemporary Russian art historians are now free to acknowledge and study the original foreign paintings (and their full

impact) inspired by Peter's patronage. Although Peter hired the Italian sculptor Carlo Rastrelli (1675?–1744), most famous for his controversial equestrian statue of the czar, Orthodox suspicion of “graven images” retarded the development of a Russian school of sculpture. After Peter's death his daughter Catherine thwarted the planned bronzing and prominent placement of the statue in front of the palace because of its Baroque qualities, but the work was eventually lauded for its likeness to Peter and for conveying character evocative of the epoch.

Peter's reign marked the beginning of an “era of apprenticeship,” when Russia mastered the conventions of Western art under the sponsorship of the imperial court and aristocracy. High art rarely penetrated into the peasant village, where culture retained traditional features. But the barrier between the Westernized upper classes and the peasantry was not impenetrable. Folk art assimilated Baroque and Classical decorations, while educated Russians collected *lubok* woodprints (popular prints often circulated as broadsides) and read folktales.

In 1757 the empress Elizabeth Petrovna (reigned 1741–1761) founded the Academy of Arts in Saint Petersburg. With a curriculum rooted in the study of classical history and classical models, it remained the unchallenged center for training Russian artists, architects, and sculptors until the mid-nineteenth century. Successful graduates were sent to France or Italy for further training. In 1764 Catherine the Great (Catherine II, reigned 1762–1796) issued the academy's charter of imperial patronage. Catherine was an avid collector, buying numerous paintings by old masters and works of applied art. One of the academy's first Russian professors of

painting was Anton Losenko (1737–1773), whose *Vladimir and Rogneda* (1770) was the first work on a theme from Russian history. The many portraits by Dmitry Levitsky (1735–1822), another academy associate known as “Russia's Gainsborough,” include the allegorical *Catherine II in the Temple of Justice* (1780s), seven canvases from the 1770s depicting Catherine's favorite students at the Smolny Institute for Noble Girls (a school she founded in 1764 to nurture and cultivate loyal subjects), and a number of “society portraits” that created an image of the aristocracy Levitsky's patrons hoped to emulate. The range of Russian subject matter was still limited, however. Aristocratic patrons preferred Italian and classical vistas to scenes of

the Russian countryside or town. Serf artists trained in Western idioms were more likely to produce Russian scenes, such as *Portrait of an Unknown Woman in Russian Dress* (1784) by Ivan Argunov.

From Romanticism to Realism: 1800–1880

Napoleon's burning of Moscow in 1812 and the march on Paris by Alexander I (reigned 1801–1825) in 1814 aroused patriotic feelings about Russian culture; German Romantic ideas about national "spirit" (*geist*) further stimulated a search for Russian themes, as did the slogan of "Orthodoxy, Autocracy, and Nationality" propagated by Nicholas I (reigned 1825–1855). The portrait of Alexander Pushkin (1827) by Orest Kiprensky (1782–1836), which depicted Russia's national poet inspired by his muse, celebrated the literary life, while portraits of serfs at "home" on the land, produced in the 1830s by their noble master (and painting teacher) Aleksii Venetsianov, seemed simultaneously to support Russia's existing ideology and set the stage for the Realist movement to come. Still, many artists with royal patronage studied and painted

classical scenes in Europe; *The Last Days of Pompeii* by Karl Briullov (1799–1852) was the first such Russian painting to receive international acclaim. Some of these academic painters could incorporate a Russian nationalistic message into works done abroad, as did Alexander Ivanov (1806–1858); his biblical scene, *The Appearance of Christ to the People* (1837–1857), prefigured what Ivanov believed to be the Russians' destiny as God's chosen people.

The middle of the century saw a significant shift in Russian painting as younger artists forsook many of the approved themes of the royal academy. A decisive event came in 1863 when a group of fourteen students walked out of the Academy of Arts, turned their backs on its royal patronage, and began to paint realistic scenes of everyday Russian life that were often infused with strong overtones of social protest. (Just two years earlier Alexander II (reigned 1855–1881) had freed 22.5 million serfs from private ownership, and the general feeling of emancipation that ensued allowed artists to approach painting as a vehicle for social criticism.) Under the leadership of Ivan Kramskoi (1837–1887), the group established the Society for Traveling (Itinerant) Art Exhibitions

to show their independent works in towns and cities away from the capital. Soon dubbed the Wanderers (*Peredvizhniki*), they continued to express the critical progressive spirit of the age of reform under Alexander II, appealing both to disaffected intellectuals and the rising Russian bourgeoisie. In fact it was wealthy new industrialists, such as the Moscow-based Pavel Tretiakov (1832–1898) who bought their paintings, thus creating the first art market in Russia and breaking artists' dependence on royal and aristocratic patronage.

The strong social commentary in their work and its exclusively Russian content appealed to both liberal political thinkers and Russian nationalists. Perhaps the most famous of these paintings from the age of reform is *Barge Haulers on the Volga* (1870–1873, also known as *The Volga Boatmen*) by Ilya Repin (1844–1930). The painting, with its line of peasants exhausted from brutal work—all of them ragged and aged except for the young blond man rising up in their midst—embodied the suffering of the Russian people while it conveyed the hopes for a generation of youth awakening to the need for change and reform. Other Wanderers' paintings, such as *Easter Procession* (1861) by Vasily Perov (1833–1882), criticized the cruelty or corruption of both the religious and political establishment. But there was another side to the Wanderers' work. Their ultrarealistic paintings

had a strong nationalistic appeal, as in the quintessentially Russian landscapes of Isaak Levitan (1860–1900) and the more chauvinistic, sweeping historical panoramas of Vasily Surikov (1848–1916). Surikov's *General Suvorov Crossing the Alps* (1900) depicts a scene from the Napoleonic wars, while his *Yermak's Conquest of Siberia* (1895), with musket-wielding Cossacks slaughtering arrow-shooting natives, more directly relates to Russia's imperialistic expansion. In fact, by the end of the century, the Wanderers and their realistic style were no longer critical of the czarist order and had been appropriated as a national school of painting.

The Birth of Modern Russian Art

The radical impulse in Russian art, both stylistically and politically, would come from a very different direction. Again the artistic stimulus originated in Europe and the patronage from Russia's new bourgeoisie. Prominent among such benefactors was the merchant-industrialist Saava Mamontov (1841–1918) whose artists' colony on his estate north of Moscow became a cradle for modern Russian art. Among those who gathered there in the 1880s and 1890s were Vasily Polenov (1844–1927), a pioneer of Russian *plein air* painting; Konstantin Korovin (1861–1939), "Russia's first Impressionist"; and Mikhail Vrubel, whose

fragmented brushwork in *Demon Seated* (1890) prefigured Cubism while his play of light on water in works such as *Swan Princess* resembled Impressionism.

Vrubel was the most obvious connection between these late-nineteenth-century innovators and the more radically modern avant-garde that arose in the years before World War I, but this blossoming of the new had an organizational headquarters in the Saint Petersburg-based World of Art group (Mir iskusstva), which incorporated figures from the performing arts such as the ballet impresario Sergey Diaghilev. Set and costume designs for Ballets Russes, which took Europe by storm after its opening in 1909, drew heavily on those inspired by World of Art aesthetics, and thus established a precedent for the close association

of visual and performing arts in the Russian avant-garde of the 1910s and 1920s.

World of Art's dissemination of works by Cezanne, Gauguin, van Gogh, and others, as well as purchases of modern Western art by entrepreneur collectors, paved the way for Russia's own prominence in the avant-garde. In the first two decades of the twentieth century as new art movements swept Europe, Russian artists, often after a spell in Paris or Berlin, made their own original contributions. Pavel Kuznetsov (1879–1968), for example, promoted Symbolism with his tempera painting *Blue Fountain* (1905), in which shadowy figures hover near a fountain—symbolic of life—set against a backdrop of green-blue foliage. The Russian avant-garde was showcased in a series of radically stylized exhibitions such as *Blue Rose* (1907), *Knave of Diamonds* (1910), *Donkey's Tail* (1912), and *Target* (1913). Typically, as in other moments of Russian history, the strong connections with Europe in the early twentieth century provoked assertions of Russian identity.

Mikhail Larionov (1881–1964) and Natalia Goncharova (1881–1962) declared that Western art had nothing to teach Russia. These and other artists found inspiration for their neo-Primitivist works in peasant villages, among city low life, and in icons, *lubok* prints, signboards, and painted toys. The most innovative was Kazimir Malevich (1878–1935), who painted his way through Impressionism, Primitivism, and Cubo-Futurism, the latter being a fusion of French Cubism and Italian Futurism. (His *Knifegrinder* of 1912 is an example of how Cubo-Futurism's systematic and tubular geometric patterns, as well as the diagonal tilt of those forms in the picture plane, give the illusion of three dimensions.) In what Malevich called an attempt to free art from the “ballast” of objectivity he founded Suprematism, a style heralded by the exhibition of his seminal *Black Square*, the “zero of form,” at the “0.10” exhibition in 1915. It signified a landmark in the evolution of Western Art—from reproduction of natural forms to pure abstraction—but other Russians were also in the forefront of experiments with abstraction. In Germany, Wassily Kandinsky (1866–1944) was independently pursuing his own experiments in the

reduction of figurative elements and expressiveness of colors and shapes (*Improvisations*, 1910–1920). In fact, seldom in world art has there been such an explosion of innovation as in the last few years of czarism in Russia. The artistic radicals were not politically active, but they fully shared the Bolsheviks' eagerness to sweep out the old in favor of the new.

Russian Revolution and Soviet Art: 1917–1953

After the Bolshevik coup of October 1917, avant-garde artists rushed to assume the artistic leadership of revolutionary Russia. Some artists who would later leave the Soviet Union to become major figures in modern art in the West, notably Kandinsky and Marc Chagall, eagerly served the new revolutionary government. From 1917 well into the 1920s a gamut of artistic credos and styles coexisted, as the Bolsheviks had no blueprint for the arts but welcomed all who served the cause. Lenin was no avant-gardist and opposed radical appeals to eliminate all “bourgeois” art, but he was glad to have the enthusiastic efforts of avant-garde artists in creating “agit-prop” art—posters, political cartoons, billboards, and designs for mass parades and political celebrations, all of which fused abstract and figurative design.

The project that best represents this brief, passionate embrace of political and artistic radicalism is the *Monument to the Third International* (1919–1920) by Vladimir Tatlin, a leading member of the Constructivists. This group of artists believed that “fine art” was dead: artistic endeavors should employ modern, real-life materials—and preferably have real-life applications—in building, furniture design, clothing, theater sets, and costumes. Tatlin’s “monument,” never existing except in sketches and as a model one-tenth the scale of its intended size, was to have been a building of futuristic design: a 1,300-foot-high spiral tower of steel and glass with revolving parts that would span the Moscow River, house the headquarters of the international Communist Party (Comintern)—and surpass the existing architectural symbol of modernity, the Eiffel Tower.

Given the technology of the time and the poverty of war-torn Russia, it was totally impractical—a dream project for a future that never was.

Other real-life Constructivist projects did materialize in the new society. Women artists had been prominent in the early stages of the Russian avant-garde and some of them, such as Varvara Stepanova (1894–1958) and Liubov Popova (1889–1924), became leaders in futuristic fashion design for the new society. The application of photography to graphic design and poster art was more directly useful to the new regime; innovators like Alexander Rodchenko (1891–1956) and El Lissitzky (1890–1941) were successful pioneers in the art of photomontage.

But the avant-garde ascendancy was short-lived. By the late 1920s it was increasingly being accused of “inaccessibility,” its “decadent” Western features contrasted with the “progressive” Realist art of the first workers’ state. With the consolidation of the one-party state under Joseph Stalin and the completion of the first phases of industrialization and collectivization, a monolithic artistic establishment emerged. In 1934, Socialist Realism was launched at the first Congress of Soviet Writers. Andrei Zhdanov (1896–1948) summoned writers and artists to depict “reality in its revolutionary development” and to provide “a glimpse of tomorrow.” Socialist Realist works were supposed to inspire by embodying qualities of popular accessibility, Party spirit, ideological content, and “typicality.” (In the 1950s Soviet Socialist Realism would influence the state of “revolutionary” art in the People’s Republic of China under Mao Zedong.) Among the best early exponents of Soviet Socialist Realism were Alexander Samokhvalov (1894–1971), who used sport and physical culture as metaphors for progress, and Alexander Deineka (1899–1969), who produced bold monumental paintings on labor themes. Another classic of Socialist Realism was *Collective Farm Festival* (1937) by Sergei Gerasimov (1885–1964), whose “glimpse of tomorrow” reveals happy, healthy workers presiding over tables groaning with festive fare. In sculpture the colossal *Worker and Collective Farm Woman* (1937) by Vera Mukhina (1889–1953), which pairs a male factory worker and

Sergei Gerasimov, *Collective Farm Festival* (1937). The painting exemplifies the Socialist Realism movement and its revolutionary message.

a female farm laborer holding aloft a hammer and sickle, the tools of their respective trades, became an icon of the USSR. During World War II Russian art remained Socialist Realist in style—modernism was still prohibited—but changed to become nationalist in content as artists depicted heroic war heroes and struggling partisans.

From the Thaw to the Fall—and Beyond

With Stalin's death in 1953 and Nikita Khrushchev's de-Stalinization came a thaw in the arts; artists were allowed more scope for private themes and individual expression, but the government's focus was still on positive portrayals of "real" Soviet life. Khrushchev himself famously denounced abstract art. In the 1960s and 1970s some artists tested the boundaries of official art by expanding the subject matter of Realism

or by experimenting with modernist styles. The authorities quickly closed independent exhibitions, most blatantly by bulldozing an open-air art show in 1974. Many artists left the USSR for the West, while others, though disaffected with Socialist Realism, turned their backs on the West. Ilya Glazunov (b. 1930), for example, explored the pre-Revolutionary, Orthodox past in *Eternal Russia* (1988), a panoramic "group portrait" of iconic figures, both sacred and secular, who shaped one hundred centuries of Russian history.

In the era of glasnost and perestroika nonconformist artists such as Eric Bulatov (b. 1933), Ilya Kabakov (b. 1933), and Anatoly Zverev (b. 1931) were able to operate more openly, mocking the socialist artistic and political system with conceptual and installation art as well as painting and graphics. Since the fall of the USSR in 1991, pluralism has been the watchword of the "second avant-garde," embracing

irreverent pastiches of Socialist Realism and Soviet symbols, religious themes, abstraction, grotesquerie, nostalgia, eroticism and kitsch, pop art, and video and installation art—all the banned styles and subjects from the Soviet years.

The late 1990s and early 2000s have seen the virtual elimination of censorship, the opening of commercial outlets for sales and exhibitions, a buoyant market for Russian art, both in Russia and abroad, and a flood of Russian publications on previously neglected topics such as the pre-Revolutionary avant-garde and religious painting. Russian artists actively engage in the international art world but still in dynamic tension with their Russian heritage, both recent and traditional.

Art—South Asia

Unlike other cultures with a high degree of technological skill, the second-millennium BCE Indus-Sarasvati civilization in South Asia has left no evidence of monumental sculpture and architecture. Such large-scale grandeur, however, would later characterize the area—from great Buddhist stupas to the Taj Mahal. Architecture and painting embodied religious influences throughout history, especially Hindu and Islamic, and today exhibit contemporary secular expressions as well.

The cultural beliefs, ideas, and practices that find visual expression in the art of South Asia—which includes the present-day nations of India, Pakistan, Afghanistan, Bangladesh, Nepal, and Sri Lanka—have had a formative influence on the rest of Asia and continue to provide important paradigms of being and becoming in modern world culture.

Sculpture

The beginnings of South Asian sculpture may be found in the early Indus-Sarasvati civilization (present-day northwestern India and eastern Pakistan) of the second millennium BCE. The mature phase of this civilization (2500–1700 BCE) carries evidence of a high level of technical knowledge and skill but, curiously, a lack of monumental sculpture or large structures such as temples or palaces. From its ruins, archaeologists have recovered small figurines in stone or cast bronze or copper, as well as terracotta animals and female figurines, the last presumed to be cultic objects. Archaeologists have also found a large number of steatite seals with impressions of bovine unicorns, buffaloes, bulls,

tigers, rhinoceros, and other composite animal figures, as well as some enigmatic human forms, surmised to have had either commercial or ritual uses (or both).

Mauryan Sculpture, c. 324–c. 200 BCE

Little material evidence has been found between the Indus-Sarasvati period and the imperial Mauryan remains of the third century BCE. The reasons for this absence are unclear, but perhaps attributable to the use of perishable construction materials and prohibitions against material representations or portrayals of deities and/or their alternatives. Vedic ritual culture is presumed to have established itself around 1500 BCE, followed by the contemplative esotericism of the Upanishads around 800 BCE and the birth of Buddhism and Jainism in the sixth century BCE.

In 326 BCE, the incursion of Alexander of Macedon (Alexander the Great) into the northwest border of the South Asian subcontinent, as part of his conquest in 330 BCE of the extensive Persian Achaemenid Empire of Darius III, created a political vacuum that was swiftly filled by the first Mauryan king, Chandragupta (reigned c. 321–297 BCE). Chandragupta's imperial ambitions were styled after Darius and Alexander, and scholars attribute his successor Asoka (reigned c. 273–232 BCE) with the Persian practice of building stone monuments, as well as with incorporating Achaemenid and Hellenistic motifs and devices in structures. In 265 BCE Asoka embraced Buddhism and proceeded to mark numerous prominent pilgrimage routes and Buddhist centers through his vast empire with tall polished stone pillars inscribed with edicts expounding the Buddhist law. Though this practice and the literary style of the inscribed proclamations

are reminiscent of an Achaemenid method used to establish the law of the emperor, they also extend to an ancient indigenous Vedic tradition, the cosmic pillar. Achaemenid and Hellenistic decorative motifs, such as rosettes, palmettes, spirals, and reel-and-bead patterns appear on these pillars and on other structural remains from Asoka's time, attesting to the cosmopolitan nature of his court and its culture.

Other monuments attributed to Asoka's patronage include Buddhist stupas (relic-mounds) and rock-cut caves, both of which became important settings for sculpture for a thousand or more years. Asokan monuments were created in sandstone and finished to a high polish, a technique that was lost to South Asia after Mauryan times.

A number of massive, frontal stone sculptures depicting male and female figures also remain from Mauryan times. These are representations of *yakshas* and *yakshinis*, supernatural elementals that had been popular in propitiatory worship for protection, fertility, or wealth. These beings and the gods of the Vedic pantheon became assimilated into early Buddhism and soon reappeared iconically as Buddhist threshold deities, protectors of devotees, bestowers of auspiciousness, and servants of the Buddha.

Sculpture during the Shunga Dynasty, c. 185–73 BCE

The Mauryan dynasty lasted for barely fifty years after the death of Asoka and was followed by the Brahminical Shunga dynasty in northern South Asia. Buddhist lay patronage, however, had developed a strong foundation, and monastic monuments continued to flourish during the second century BCE. Typical examples of the sculpture of this period are found among the remains of the stupa of Bharhut. The circular stone railing (*vedika*) enclosing the stupa has carved roundels on its horizontal and vertical components, often elaborated into ornate lotuses. Some of these roundels have carvings of human heads or animals at their center and some are filled in with narrative scenes from the life of the Buddha or episodes from tales of his past lives. At this stage, Buddha's

figure is never depicted; instead we see symbols such as the Bodhi tree (under which the Buddha attained enlightenment), the Wheel of the Law, or a stupa, according to narrative context. The relief carving is shallow and frontal and harks back to a tradition in wood. On the vertical entrance-posts of the *vedika* are chiseled large figures of *yakshas* and *yakshinis*, standing on animal or dwarf mounts.

This post-Mauryan Buddhist relief tradition reached its full maturity around the first century BCE, as evidenced in the gateways (*torana*) of the Great Stupa at Sanchi. This stupa, at the center of a monastic complex, was established by Asoka and further enlarged during Shunga times. Around 100 BCE, during the reign of the Satavahanas, four great gateways were erected at the cardinal entrances to this stupa. The horizontal and vertical elements of these gateways carry carvings thematically similar to those at Bharhut. These carvings demonstrate much greater technical assurance, however; the narrative arrangements, particularly on the extended horizontal architraves, show a refined clarity of form, a varied mobility of posture, and a judicious use of devices to enhance sense of depth where necessary. Large and powerful figures of elephants, lions, or dwarfs are carved out deeply on the vertical pillars and seem to support the upper portions. But perhaps the most perfect realizations on these gates are the *shalabhanjikas*, fertility symbols in the form of voluptuous women posed seductively, the rhythmic swing of their forms clinging to fruiting tree branches. The perfect combination of ecstatic sensuousness and contemplative repose in these figures became one of the aesthetic ideals of South Asian sculpture, seeking fulfillment in different forms through history.

Sculpture during the Kushan Dynasty, 78–200 CE

Around the beginning of the Christian era, the Kushan dynasty, originating in the borderlands of Central Asia and China, established itself as the imperial power in northern South Asia. The most famous king of this dynasty was Kanishka (reigned 78–101 CE). Around this time the first figural depictions of the Buddha

make their appearance, almost simultaneously in the northwest province of Gandhara and the Gangetic metropolis of Mathura. Reasons for this iconic appearance are unknown, but may be related to doctrinal shifts in Buddhism from the more austere Theravada Buddhism toward the devotionism of Mahayana Buddhism. Both the Gandhara and Mathura Buddha images express a consistent iconography, though they are stylistically divergent. The Gandhara Buddha is modeled after a Greco-Roman Apollonian prototype, while the Mathura figure derives from indigenous *yaksha* traditions. In both cases, the Buddha is draped in monastic robes, has a halo behind his head and a whorl of hair between the eyebrows (*urna*), and is shown with a cranial protuberance (*ushnisha*) symbolizing transcendental knowledge. He is either seated in meditation or standing erect with his right hand raised in a gesture of bestowing fearlessness.

Whereas predominant naturalism marks the features and costuming of the Gandhara figure, simplified rounded features, see-through draping, monumentality, and physical tension projecting power distinguish the Mathura image. Bodhisattva figures in the characteristic styles of Gandhara and Mathura also appeared at this time, wearing regal accoutrements and, in the case of named and worshipped bodhisattvas, carrying their distinctive attributes. The Kushan period also yields the earliest Brahmanical images in stone, representing the three major cults of Hindu worship—those devoted to Siva, Vishnu, and the Mother Goddess, particularly in her form as Durga, the destroyer of evil. Other prominent Brahmanical deities represented include Surya and Skanda.

Sculpture under the Guptas, (c. 320–c. 500)

During the fourth century, a new Hindu imperial dynasty established itself in northern South Asia, whose reign, patronage, and courtly culture are credited with the development of the classical style in South Asian art. This was the Gupta dynasty, whose most famous king was Candragupta II (reigned 375–415 CE). During this period, the major center for the production of

Buddha images in the east shifted from Mathura to Sarnath. Idealized soft modeling and self-absorbed, tranquil features characterize the style of this period, which replaced the Kushan Buddhas. Standardized and compacted iconic elements and a vocabulary of distinctive hand gestures (*mudras*), meant to mark special occasions, accompanies these images. Others figures in the Buddhist pantheon undergo a similar elaboration and stylistic change, and the Buddha and several bodhisattvas also appear in bronze casts.

During this period relief sculptures draw upon a proliferation of Hindu deities, organized spatially in integrated contexts of ritual worship. Initially, these works were sited in niches inside cave-temples, but the stand-alone Hindu temple in stone also evolved at this time and henceforth became the setting for sculpture. Because the Guptas were followers of Vishnu, images of this deity and his incarnations (*avatars*), were frequently represented, and an increased emphasis on goddesses and other female images is apparent in the works.

A developed Saivite iconography, depicting mythical episodes connected with Siva and his consort, Parvati, also found expression at sites of cultic worship. Saivite cultic placement consigns the abstract phallic icon of Siva (the *lingam*) to the sanctum, faced from the entrance of the temple by Siva's mount, the bull Nandi, and surrounded along a clockwise circumambulatory path by niches carrying other gods and goddesses and scenes showing the pastimes of Siva.

By the end of the fifth century, all these figures evolved into an aesthetic that shared the monumental repose of the Gupta Buddha but integrated it with a power of massiveness and restrained ecstatic delight. Contemporaneously, in the Deccan (central India), a related but more voluptuous aesthetic developed in Buddhist and Hindu figural expression, under the patronage of the powerful Vakatakas, related by marriage to the Guptas. Examples of the full fruition of the Vakataka Buddhist style are visible at the cave excavations at Ajanta in southern central India, while the early excavations at nearby Ellora or at the island of Elephanta, dateable to the early sixth century,

The stone carving of the god Vishnu adorns the interior wall of a Hindu temple in India.

show examples of Deccan Saivite sculpture of this period at its ripeness.

Developments in Sculpture, Sixth to Twelfth Centuries

Though the stand-alone Hindu stone temple first appeared in South Asia under the Guptas, it evolved into maturity in the sixth century under the Western Calukya dynasty (543–757; c. 975–c. 1189) in the southern Deccan, and through the seventh century in southern India under the Pallavas (c. 550–728 CE).

Sculpture during this period continued to develop local variants of the Gupta iconography and style, but in these southern centers so did a marked tendency toward a greater plastic dynamism in the figures. A fine example of this may be observed in a panel from seventh-century Pallava Mamallapuram depicting Durga battling the buffalo demon. Here the dramatic interest and the portrayal of power in motion replaces the iconic stillness and massiveness of Gupta deities. Subsequent sculpture in southern India continues to develop in fluidity, reaching perhaps the zenith of integrating stillness and movement in the tenth-century image of the dancing Siva, Nataraja, which was developed in South India under Cola patronage.

From the tenth to the twelfth century, South Asian sculptors evolved such a consummate skill and facility in carving that sculpture during this period spills out of the measured enclosure of niches and dominates the temple surface. The temple as an integral whole projects the impression of the mighty, immobile, cosmic Mount Meru, which contains the multitudinous, varied activity of the world at its base. The sculpted forms of deities and celestial denizens stand or interact in various fluid postures, expressing the ecstatic repose of transcendental action. In the case of the temples at Orissa and Khajuraho in eastern and central India, respectively, a strong erotic element also found expression, indicating the prominent presence of Tantric cults. This high achievement of the successful marriage of static soaring temple forms and teeming mobile surfaces marked the final creative outburst of the South Asian tradition in sculpture.

Buddhism disappeared from India by the thirteenth century and gradual Islamic dominance of northern South Asia from the twelfth century inhibited the production of large-scale Hindu temple complexes. The Vijayanagara kingdom of the south and other pockets that offered resistance to Muslim conquest managed to continue the tradition until the sixteenth and seventeenth century, but with a progressive diminution of creativity.

Islamic architecture brought a new visual language of domes, arches, and minarets to the South

Asian building environment and found expression in mosques, tombs, and forts. Marrying Afghan and Turkish styles with the Indic skill in stone carving, it left its most prominent marks in the cities of north central India and to some extent in the Deccan region, from the twelfth to the nineteenth century. Eschewing figurative sculpture due to religious prohibition, this architecture nevertheless gives us the most exquisite carved, inlaid, and latticed surfaces with calligraphy, foliate patters, and intricate geometric designs.

Under Mughal rule (1526–1857 CE), Islamic architecture reached its greatest heights in the sixteenth and seventeenth centuries. The gates, halls, pavilions, mosques, and tombs commissioned by the third Mughal emperor, Akbar (1543–1605), at Agra and Fatehpur Skiri can be seen as precursors to the legendary beauty of the Taj Mahal, built by Shah Jehan (1592–1666) in Agra as a tomb for one of his wives, Mumtaz. Placed at the far end of a garden, the Taj's soaring dome and minarets in white marble, combined with the majestic simplicity of its design and the perfection of its proportions, evoke a supernatural archetype. Close up, its massive white marble surface reveals colorful borders with flowers, leaves, and Qur'anic calligraphy inlaid using a *pietra dura* (relief mosaic with semiprecious stones) technique.

After 1857, most of South Asia was brought under the British crown as a colony of Great Britain. The colonial period, leading up to the division and political independence of India and Pakistan in 1947, was known for its imperial Victorian architecture, particularly in the major colonial centers of Calcutta (Kolkata), Bombay (Mumbai), Madras, and Delhi. Following independence, both India and Pakistan have entered into the mainstream of a global modernity, where international functional concerns mix with national and regional identity issues in fashioning a contemporary South Asian architecture.

Painting

The earliest remaining examples of painting in South Asia are Buddhist cave murals such as those in the monasteries at Ajanta. Here, two phases of painting,

corresponding to two phases of excavation, may be distinguished, the earlier being from the first century BCE and the later from the fifth century CE. The themes depict stories and scenes, mainly from the life of the Buddha. The murals are made with mineral colors on a specially plastered surface and, particularly in the later phase, are characterized by hieratic scaling (more important figures are bigger), Buddha and bodhisattvas shown in formal poses and with stylized physiognomy, and others depicted more realistically. Elements of three-dimensional modeling and perspective are mixed in with two-dimensional "flat" figuring, to introduce a semblance of realism in representations where narrative interest clearly takes precedence over natural illusion.

Early Manuscripts

In painting, following Ajanta of the Vakataka period, few other fragmentary murals in cave or temple settings remain. The earliest surviving manuscript paintings are eleventh-century illustrated Buddhist and Jaina palm-leaf manuscripts of religious texts. These texts were venerated as sacred objects and offered as religious donations by patrons.

Extant eleventh- and twelfth-century Buddhist palm-leaf manuscripts come largely from regions in eastern India and often have generic scenes from the life of the Buddha painted on the inner surfaces of the wooden boards that bind the palm leaves; such scenes also serve as dividing elements between segments of text. The images are iconic and seldom directly related to the text. Hieratic scaling and static figural postures executed using a rhythmic outline and filled in with flat opaque mineral colors characterize the painting style.

The Jaina manuscripts were mostly produced in the Gujarat region of western India. By the last quarter of the fourteenth century, paper had become the preferred medium for Jaina manuscripts, and a rectangular form more suited to larger illustrations gradually replaced the elongated palm-leaf format. Jaina manuscripts make use of a restricted and bold color scheme and rhythmically outlined, flattened figures,

The Hindu Shore Temple at Mahabalipuram, India, displays many features of South Asian monumental sculpture and ornamentation. Photo by Klaus Klostermaier.

as in the Buddhist tradition. There is no attempt to depict spatial depth. A characteristic of the figures is their invariable presentation in profile with the eye on the invisible side of the face protruded into visibility.

The oldest extant illustrated Hindu manuscripts date to the second half of the fifteenth century and follow the conventions of Jaina painting. Hindu myths and epics had by this time become standardized and

pervasive in popular South Asian culture, and episodic representations of these themes found expression in these illustrations. From the early sixteenth century, a bold shift appears in this tradition, prioritizing the image over the text. The by-then standard rectangular form of the page was mostly occupied by the pictorial representation, with an abbreviated textual description in the upper margin and the extended

text on the obverse of the page. This tradition made its appearance in Rajasthan and the western Gangetic kingdoms of northern India and is presumed to have originated in royal and other wealthy patronage. The contemporaneous rising popularity of medieval Vaishnavism (worship of Vishnu), with its use of an erotic symbology to describe the mystical pastimes of Krishna (Vishnu's most famous incarnation) must have played its part in fueling this production. The incorporation of a Vaishnav mystical context into literary and courtly amorous narratives characterizes this painting tradition and initiated a thematic stream that continued through the history of South Asian painting. Though these paintings attempt to convey spatial depth, they are essentially flat, with stylized figures shown in static profile, making hieratic gestures in starkly simplified color planes. This painterly aesthetic, commonly known as the "Rajput style," remained a viable South Asian idiom of painting throughout subsequent centuries, resurfacing in various times and places.

Mughal Painting, 1526–1857

The sixteenth century also witnessed the hegemonic rule of the Mughals in northern South Asia, resulting in a new school of painting, unsurprisingly and commonly known as Mughal painting. The initiation of this school occurred in the mid-sixteenth century during the rule of the second Mughal emperor, Humayun (reigned 1530–1540 and 1555–1556). Humayan brought two master painters from the court of Tabriz—Abdus Samad and Mir Sayyid Ali—to found his atelier at Delhi in 1555. Within a year, Humayun died and was succeeded by his son, Akbar (reigned 1556–1605). Akbar had an abiding passion for the arts of painting and storytelling and quickly built up his father's atelier to illustrate a large number of Persian and Hindu secular and religious texts. Akbar's earliest commission was the illustration of the *Tutinama* (Tales of the Parrot). A large number of artists recruited from existing South Asian painting traditions worked under the direction of the Persian masters, resulting in a hybrid style and aesthetic which, by the time of

Akbar's second commission, had developed a distinctive identity. Mixed perspective, structured visibility of interiors, and natural elements such as mountains and trees are taken from Persian prototypes; hieratic patterning, bold coloring, and narrative arrangements are reminiscent of indigenous traditions; uniquely new with the early Mughal painting style were a patterned variety of coloring, a judicious introduction of three-dimensional modeling, and a crowded swirl of highly individualized figure-types laid out in a space divided by forms from nature (such as trees or rocks) to give an added sense of depth.

From the mid-sixteenth century, the influence of Renaissance naturalism, introduced into Akbar's court by Jesuits, began to gain prominence in the works produced in his atelier. Space and volume were defined by light and shade. Aerial perspective was introduced, as were atmospheric effects to depict spatial recession.

These techniques continued to gain prominence in paintings from the courts of Akbar's successors. The Mughal atelier remained as prolific under Akbar's son, Jahangir (reigned 1605–1627), though the thematic interest shifted from dynamic narrative episodes to carefully attentive portraiture, scenes of psychological interest, and detailed though stylized studies of flowers and animals. A number of superb allegorical portraits of the emperor come to us from this court. Though the Mughal atelier continued during the reign of Jahangir's son and successor, Shah Jahan (reigned 1628–1658), it seemed to have lost its vitality and inventiveness. The paintings of this period are marked by a courtly stiffness and formalism and lack the boldness of color or composition of either Rajput paintings or earlier Mughal work. The Mughal atelier largely dispersed during the reign of the Islamic puritan Aurangzeb (reigned 1658–1707), son and successor of Shah Jahan.

Seventeenth- and Eighteenth-Century Developments

In the Deccan kingdoms of central India, small Islamic states had established themselves since the

fourteenth century and developed independent cultural traditions. Among these, the most important were the kingdoms of Golconda and Bijapur, which remained independent until late in the Aurangzeb's reign. With cultural roots in Persia and Turkey, these kingdoms developed their own painting traditions, known as the Deccani style, marked by a rich coloration dominated by lavender, gold, and green, a jeweler's eye for decorative pattern, and mystical or fantastic stylizations.

From Akbar's time, a number of the Rajput courts came under the suzerainty of the Mughals, developing close courtly liaisons. Mughal stylistic influences began appearing in the paintings of a number of these courts. In the late seventeenth century, after the dispersal of artists from Aurangzeb's court, further assimilation of Mughal thematic and stylistic idioms continued in the Hindu Rajput states. Here, the earlier predominance of Hindu religious themes was complemented by formalized portraiture of the maharaja seen in court or in gardens or terraces with attendants, or in equestrian or hunting scenes. But these scenes, and some Mughal stylistic elements, were mostly incorporated into flat decorative "Rajput" compositions in courts of this period, such as those of Kota and Mewar. The Bikaner paintings of the same period, on the other hand, show a much closer affinity to the naturalism of Mughal style combined with the decorative patterning and mystical palette of the Deccan courts.

The Mughal court saw a brief and brilliant revival during the reign of Aurangzeb's grandson, Muhammad Shah (reigned 1719–1748). The idealized moody romanticism of the paintings produced under him, thematically focused on courtly love and characterized by naturalistic atmospheric effects, carried over once more to inspire two of the finest and most charismatic schools of late Rajput and Pahari painting respectively, those of Kishangarh and Kangra.

In the mid-eighteenth century, a fruitful collaboration between Raja Savant Singh (reigned 1748–1764) of the Rajput state of Kishangarh and the two master artists of his court, Bhavani Das and Nihal Chand,

both originally from Delhi, led to the formation of a unique and distinctive style of painting. Extending the moody romanticism of the late Mughal court, Kishangarh painting of this period produced a large corpus of highly stylized depictions of its patron raja and the object of the raja's affection, the court singer Bani Thani, with the two portrayed as Krishna and Krishna's beloved Radha, respectively.

A similar effect, using different means and developing a different and more refined aesthetic, also appeared around the mid-eighteenth century in the hill states of Guler, Jasrota, and Kangra, and is attributed to the efforts of two artist brothers, Manaku and Nainsukh (1710–1778), and their students. Nainsukh's work in the court of Raja Balwant Singh of Jasrota (1724–1763) in particular can be said to originate the highly prized late Kangra School. The thematic mainstay of this school, like the school in Kishangarh, drew upon the dalliances of Radha and Krishna. Here the late Mughal romantic figures and style are transformed by a dream-laden, tranquil, naturalistic backdrop into a languorous intimate amorous moment in the secret wood, where time stands still and the divine couple, stylized using an aesthetic of balanced refinement, savor eternal delight in time-born bodies.

From the mid-eighteenth century, the British presence in South Asia exerted a powerful influence on courtly taste, moving it toward photorealism. The advent of photography itself contributed in no small measure to this change. Indigenous artists trained in earlier courtly styles now adapted their work to imitate the camera. Whereas some of these artists continued serving native patrons, particularly through portraiture, the British employed several artists to record scenes of South Asian life, its landscapes, and its flora and fauna. The work of these artists forms a body known as the Company School.

Twentieth and Twenty-First Centuries

At the beginning of the twentieth century, as part of a nationalistic rethinking of identity, the Calcutta artist Rabindranath Tagore and his students

The world speaks to me in colours, and my soul answers in music. • **Rabindranath Tagore (1861–1941)**

deliberately moved away from Western-influenced styles. Known today as the Bengal School, these artists fashioned a distinctive style affiliated with an international antimaterialist movement and Pan-Asianism by integrating elements of Rajput, Mughal, Japanese, and Pre-Raphaelite style. From the second quarter of the twentieth century, international Modernism began increasingly to influence South Asian art, opening up a variety of creative adaptations. Today, the contemporary art scene in South Asia is among the most vibrant and prolific in the world, with increasing numbers of artists making bold forays into individualized modes of expression suited to the social, cultural, and local contexts of the subcontinent.

Art—Southeast Asia

From highly decorated pottery and small bronze utilitarian objects to the great stupa of Borobudur in Java, Indonesia, and the monumental temple complex at Cambodia's Angkor Wat, Southeast Asia's astonishing array of art and architecture was the product of innovation, invention, and transformation of cross-cultural influence, especially Hinduism and Buddhism.

Southeast Asia has some of the most distinctive and impressive art traditions in the world. From earliest times into the present the countries in mainland and insular Southeast Asia have been centers of artistic innovation and the recipients and transformers of artistic influences from outside. The names *Indochina* and *Indonesia* point to some of the outside influences but they mask a deeper sense of cultural layering, innovation, and invention.

The Earliest Art

Some of the earliest pottery and bronze artifacts in the world have been discovered in small rural villages in northern Thailand. Starting about 3600 BCE, fine decorated pottery was made at sites such as Ban Chiang and Non Nok Tha. The oldest examples from Ban Chiang are a grayish pottery decorated with incised designs, followed in about 1000 BCE by striking beige-colored pots with fine geometric shapes and restrained painted decoration in red ochre pigment. The final phase, lasting until about 250 BCE, includes elaborately shaped vessels with a profusion of painted linear decoration usually forming complex swirls.

The Bronze Age in Southeast Asia began about 2000 BCE with utilitarian implements found at Non Nok Tha. The discovery of these artifacts indicates that Southeast Asia, one of the first areas in the world in which people mastered the art of shaping bronze. Large-scale use of bronze in Southeast Asia occurred much later, however, from about 500 BCE to about 350 BCE. Some magnificent large-scale works distributed over a vast area of mainland and insular Southeast Asia date from that period. This Dong Son culture, so named after the first site unearthed in northern Vietnam, produced, among other objects, decorated socketed axes, elaborate bronze flasks, and, most famously, more than two hundred impressive metal drums. The drums are decorated with linear designs typically including a sun and star pattern at the center of the tympanum, around which images of circling birds and geometric ornaments appear in concentric rings. Some examples include three-dimensional frogs situated at the edge of the tympanum. Along the sides long narrow boats with plumed passengers are aligned as if in a procession. The symbolism of heavenly bodies and water suggests the drums had a religious significance, but they may have been used in warfare or in burial or ceremonial rituals.

Bronzes have been found as far as Lake Sentani in West Papua, Indonesia. This wide distribution, combined with the great diversity of styles throughout the Indonesian archipelago, indicates that trade in these artifacts, as well as Roman coins and early Indian items, took place prior to the formal entry of Buddhist and Hindu art from India in the ninth century CE. Powerful rulers most likely commanded the production, export, and import of valuable and elaborate artifacts.

Indian Influences

The earliest contacts between western Southeast Asia, Sri Lanka, and India were most likely in the form of trade carried forth by merchants originating in both India and the islands of Southeast Asia. The Chinese were also part of this early commerce and, traveling as Buddhist and Hindu pilgrims, may have played an important role in diffusing these religious beliefs. It is uncertain precisely when this trade began but the earliest Indian and Chinese accounts vaguely refer to Indianized sites in Funan in the third century in Cambodia, and the Srivijaya dynasty centering on Palembang in South Sumatra. Large quantities of (Chinese) Tang dynasty (618–907 CE) ceramics date the Sumatran sites to about the seventh to the ninth centuries. It appears that no invasion or colonization from India ever occurred. Southeast Asian rulers transformed social and religious concepts into practical models for their own society.

Indonesia

Metropolitan Buddhist and Hindu art from India became prevalent beginning about 800 in the Dieng plateau of central Java with a series of elaborate stone religious buildings. The earliest, built under the Sailendra rulers (778–864), are Buddhist and include the most impressive monument of ancient Indonesia, the great stupa of Borobudur.

A stupa, intended to be a monument to the Buddha, is often a giant reliquary containing some part of the body of the Buddha within its structure. It also functions as a cosmic model, incorporating the cardinal directions and the idea of the rotation of the universe around an axis. The sculpture on a stupa takes the viewer through the stages of enlightenment, beginning at the level of the everyday world, moving through the story of the life of the Buddha, and then beyond into the realms of nirvana. The stupa at Borobudur does all of this, but in a new design and on a massive scale. Built of approximately 57,000 cubic meters of stone, it has been called the largest unified work of art in the world.

Stairways lead up to the rectangular lower levels of the monument. At each tier one turns left and walks past subtly carved relief panels depicting the life of the Buddha amplified with details drawn from daily life in ninth-century Java. There are carvings of large outrigger sailing vessels and court ladies all done in a style derived from fifth-century Indian traditions but modified in a uniquely Indonesian way. Figures have a rounded sensuality with delicate features and gestures. As one goes higher in the monument there are more images of seated Buddhas, until at the highest rectangular levels there are niches with three-dimensional seated Buddha figures in them. At the upper levels rectangular tiers give way to circular tiers, and relief sculptures are replaced by open bell-shaped stupa forms. Free-standing Buddha images can be seen inside through the openwork of these smaller stupas. The pinnacle of the monument is a solid dome-shaped stupa that marks the center and axis of Borobudur.

Buddhist and Hindu dynasties competed and succeeded each other on the basis of trade and political intrigue rather than religion. In fact, religious dynastic labels are based upon the emphasis they placed upon a single religion rather than the exclusion of the other, and religious sites and statues often blend both Hindu and Buddhist concepts and iconography. The finest Hindu monument in Indonesia, reputedly constructed in 856 by King Ratu Baka, is Prambanan (also called the Lara Jonggrang complex). It consists of three tall temples, each dedicated to one of the three major Hindu deities. The largest and central *candi* (pronounced “chandi”), or temple, is dedicated to Siva. Flanking it are smaller temples dedicated to Vishnu and Brahma. The high temple symbolizes the sacred mountain where Siva lives with his consort Parvati. Although obviously derived from Indian sources, the architecture of the temple complex is not a direct copy but a reinterpretation. As at Borobudur, which is located nearby, the sculpture offers subtle variations based upon Indian sources but with gentler poses and facial expressions. The reliefs on the temples illustrate the two greatest Hindu epics, the *Ramayana* and *Mahabharata*. An interesting detail in

one relief shows a building rendered in linear perspective—more than five hundred years earlier than that technique was codified in Italy. Smaller temples face the three major temples. These are dedicated to the mounts of the three deities; Nandi, the bull whom Siva rides, Garuda, the bird that Vishnu rides, and Angsa, the goose for Brahma.

As Islam began its move into Indonesia in the thirteenth century, the Hindu-Buddhist rulers move eastward on the island of Java, establishing the Singasari (1272–1293) and Majapahit (1293–1520) dynasties. There they continued to create great temples such as Candi Singasari and Candi Panataran. Eventually Islam became the dominant religion on Java, and the Hindu-Buddhist rulers moved onto the island of Bali. Despite the conversion to Islam, Hindu epics still play a vital role in the court and everyday culture in Java and elsewhere in contemporary Indonesia. Most famous are the shadow puppet (*wayang kulit*) performances and masked dances accompanied by a gamelan orchestra and singing of the Hindu epic, the *Ramayana*. Bali today is the only Hindu area outside of India and Indian diaspora communities.

On Bali art and religion merge seamlessly, and in some way or another nearly everybody engages in the production of art, music, and dance. The island is dotted with temples, shrines, and palaces. The large active volcano Gunung Agung is sacred to the inhabitants, and rituals performed in its main temple, Pura Besakih, are performed to maintain the order of the universe. Like Prambanan, Besakih is dedicated to the three major Hindu deities, but the architecture is quite different. A massive stone stairway leads up the slope of the mountain, and on the terraces above there are thatched wooden buildings somewhat resembling pagodas that represent Mount Meru, the mountain of the gods at the center of the universe in Hindu cosmology.

Cambodia

In Cambodia, the Khmer Empire, which began its rise in the seventh century and was at its peak in the ninth through twelfth centuries, fashioned equally

This cave carving is typical of many found in the Angkor Wat temple complex in Cambodia.

impressive arts that combined Hindu and Buddhist influences. One of the most remarkable world monuments is Angkor Wat. Begun around 1113 by the ruler Suryavarman II (d. c. 1150) and completed around 1250, Angkor Wat is a veritable city of art. It includes a giant stone temple complex surrounded by moats with bridges and sculpted buildings and towers. (The site is set amidst large rectangular artificial lakes that provide water for the planting season.) The lotus-bud-shaped redented towers are a distinctive feature of the architectural style, itself a unique Khmer blend of Hindu and Buddhist elements. Relief sculptures, integrated with the architecture, also use a Khmer style portraying a range of subjects from the Hindu epics, to battles, to delicate dancing maidens. The faces are delicately carved with squarish chins and rather

thick, broad lips that sometimes have bow-shaped mustaches. The eyebrows flow across the ridge above the nose, also forming the double curve of an archer's bow; hair is rendered in even-lined patterns. The figures as a whole have a subtle meditative look. Many of the reliefs that depict action scenes use a great number of figures to create kinesthetic patterns throughout compositions of rhythmically repeating curves.

Although smaller than Angkor Wat, nearby Angkor Thom is also remarkable. The main structure, called the Bayon, has high towers at the periphery of the main buildings. The sides of the towers have giant faces carved on them that are thought to represent the ruler Jayavarman VII (c. 1120–c. 1215), the monarch who commanded the construction of the site. The serenely stylized portraits blur the distinction between rulers and gods, suggesting that Jayavarman VII is a *devaraja*, a king who has the attributes of a god.

Burma (Myanmar)

The great Buddhist movements of Burma (Myanmar) originated in 1056 under King Anawratha in the fertile Irawaddy River basin extending to the Salween River delta. From its beginnings, Buddhism in Burma incorporated an indigenous belief in spirits called Nats (originally meaning “lords”) that had dominion over a group or object. At first these spirits were impersonal and local—the Nat of a tree or a hillside, for instance), but eventually a panoply of thirty-six “national” Nats, each a distinct personage with a life history, became the subject of much Burmese art; Buddha, in fact, is considered the thirty-seventh Nat. Hence Buddhist temples are as much Nat-houses as they are dedicated to Buddhism. The earliest large-scale Buddhist site is the city of Pagan. This city, a tremendously impressive collection of hundreds of temples, shows the evolution of their architectural tradition from Indian sources to a distinctive Burmese style.

Perhaps the most impressive monument is the giant Schwe Dagon stupa in the city of Rangoon (Yangon). Construction began in the fourteenth century under the ruler Binnya U; the resulting 22-meter-high monument was then modified many times during the next

Nguyen Phan Chanh, *Re Lua* (1960). Nguyen Phan Chanh, one of Vietnam's most celebrated artists, paints on silk with colors that evoke the countryside.

four hundred years. After an earthquake it underwent reconstruction from 1763 to 1776 to reach its present height of 99.4 meters. The white, bell-shaped form of the stucco and brick monument closely resembles prototypes in Sri Lanka, particularly at the fifth-century site of Annuradhapura. Numerous shrines resembling Chinese pagodas and an array of Buddhist sculpture surround it.

Thailand

After contact with the Burmese kingdom of Pagan, the tribal peoples of Thailand adopted Buddhism. The cities of Chiangmai in the north and Ayuthia in the south became early centers for the spread of the new religion. From its beginnings, the southern part of Thailand was dominated by Cambodian Khmer civilization. But in 1287, when the Mongols invaded

Pagan, three powerful Thai chiefdoms combined to form the kingdom of Sukhodaya and spread Buddhism to all parts of Thailand. The cannons of Theravada Buddhism prevalent in Thailand fixed the sculpture style, making it difficult to chronicle changes over time but also making it easy to identify Thai Buddhist imagery: slender forms and tall spire-like head protuberances.

When the capital of Thailand was moved to Bangkok in 1767, numerous buildings were constructed as very ornate versions of wooden architecture in other parts of Southeast Asia, particularly Burma. The Temple of the Emerald Buddha in the royal palace compound is typical with its steep roofs with dragon finials at the gables. The gables emerge in sections from within each other as they do in Burma and other parts of Southeast Asia.

Chinese and Indian Influences in Vietnam

Chinese influence predominated during their occupation of Vietnam during the second century BCE to the tenth century, and rose again in the thirteenth and fourteenth century, especially regarding the symbolism of the dragon in folklore and myth, and as a decorative motif in art. (For Vietnamese peasants, dragons represented a four-fold deity—clouds, rain, thunder, and lightning); for rulers, dragons became, as they did in China, a symbol of authority and power.) Dragon imagery is found in sculpture, painting, and architecture, and the Chinese influence is remarkable in the brick tiles (dating to about the tenth century) at the Co Loa citadel near present-day Hanoi.

Influenced by early Hindu civilization, the loose federation of states that comprised the kingdom of Champa, whose population comprised several ethnic groups, flourished in the south and central part of Vietnam in an area then called Annam. Much of its contentious history, from its founding in the second century CE to the time it was absorbed almost entirely by the Vietnamese, can be characterized as a period of struggle against the Chinese (depending on the Chinese dynasty in power), a greater sense of freedom

with the independence of the Vietnamese in the tenth century, and to a lesser extent its relationship with Java. The brick temples of the Champa, much influenced by Hindu elements of design, consisted of tall tower structures with flame-like arches over the doorways; the exterior walls are decorated with bas-relief columns adorned with carvings of flowers and leaves. Sandstone lintels and ornamental corner pieces are carved with the figures of gods and animals sacred to the Hindu. Cham sculpture is especially distinctive; and yet similar in some ways to the Khmer aesthetic, with very square faces, very thick broad lips and exaggerated bow-shaped eyebrows that at times extend across the forehead as a rope-like ridge. Halos typically had foliage that resembled a mass of worms. While these figures are indeed imposing, polished figures from later periods convey austerity and unearthly calm.

Tribal Arts

In the remote parts of Southeast Asia, the highlands of mainland Southeast Asia and distant islands of Indonesia, many tribal groups either resisted or missed the larger metropolitan influences coming from the west and north. Some extraordinary and unique art traditions from these locales have only recently caught the attention of the outside world. In the highlands of mainland Southeast Asia ethnic groups such as the Hmong, the Ahka, and the Yao produce intricate embroidered and dyed costumes and spectacular jewelry, particularly in silver.

Indonesia is particularly rich in these cultures. On the island of Nias, off the west coast of Sumatra, the inhabitants build large and impressive houses. One royal palace is 20 meters high, supported underneath by over 100 gigantic pillars. There are also elaborate megalithic monuments in the villages that memorialize the dead and commemorate sumptuous feasts that raise the status of the rulers. In Nias, and many other parts of tribal Southeast Asia such as Sumba, islands in South Maluku, and among the Batak peoples of Sumatra and the Toraja peoples of Sulawesi, elaborate gold jewelry celebrates status and is rich in symbolic value.

The Toraja people on the island of Sulawesi are also known for their fine architecture, but their highest artistic achievement centers on their funeral rites. To memorialize a high-ranking chief an enormous banquet is prepared as hundreds of people sing and dance in their finest attire and jewelry. Special houses are constructed for the guests and to serve the ceremonial purposes of the funeral. Life-sized wooden effigies called *tautau* are placed in grottos as testimonials to the fame of the ancestors.

Modern Art

Time-honored arts still flourish throughout Southeast Asia. Fine textiles, jewelry, traditional weaponry, and architecture can still be found in great abundance. As in cultures around the world, however, long-established ways of life and their accompanying artistic traditions are changing and to some extent vanishing under contemporary economic, religious, political, and technological influences. In much of Southeast Asia newer forms of contemporary art are being created that express the individual ideas of the artists and contemporary social and political conditions. Today, not only Southeast Asia's traditional art, but also the art created by its contemporary artists, particularly those from the Philippines, Indonesia, and Malaysia, can be now seen in the museums and galleries of New York, London, and Paris.

Art—West Asia

West Asia has a long and complex artistic tradition, beginning in the Neolithic era, during which indigenous forms of visual expression have been subjected again and again to new influences from both East and West. The spread of Hellenic culture in Ionia and the influx of Islam and the crusades, for example—appears in a number of media, from splendid mosques and mosaics and from knotted carpets to arts of the book.

In early times the main centers of artistic development in West Asia were focused in the cities of Mesopotamia, Anatolia, and the west Mediterranean littoral. The Persian and Helleno-Roman empires, including Byzantium, that ruled various parts of West Asia from around 550 BCE until 650 CE and beyond introduced artistic traditions with a broader range and wider geographical span. Finally, after the seventh century CE, Islamic art gradually became the dominant visual culture in West Asia, although other traditions continued as well.

Earliest Artifacts

Among the earliest forms of art surviving from West Asia are those from Neolithic settlements and from Mesopotamia. Çatal Höyük on the south central Anatolian plain was settled from around 6500 to 5650 BCE, and excavations there have uncovered architecture, sculpture, beautifully decorated pottery, wall paintings, and the remains of what appears to have been a vibrant weaving tradition. The Ubaid culture of Mesopotamia, which flourished after 4300 BCE, appears to have provided a foundation for the later art of the Sumerians.

Due largely to twentieth-century excavations and scholarship, we now know of the artistic accomplishments of the great city-states of Mesopotamia, beginning with the Sumerian city of Kish, whose earliest inscriptions can be dated to around 2600 BCE, followed in later Sumerian times by Lagash, seat of the Sumerian ruler Gudea around 2050 BCE, and Ur, whose excavation has yielded remarkable royal and priestly objects, as well as a giant ziggurat constructed around 2100 BCE. In 2334 BCE the Akkadian king Sargon built a new empire, with Nineveh as its political and cultural capital, before falling to a Sumerian resurgence. One of the most remarkable artifacts from the period, a famous copper head of a Nineveh man, was stolen during April 2003 looting of the Iraq Museum in Baghdad. (Ironically, it is possible that the head had been symbolically mutilated during antiquity, much in the same way as contemporary Iraqis mutilated statues of Saddam Hussein; when the object was discovered its ears and the inlays that filled its eye sockets appeared to have been deliberately removed.) Among the thousands of other works pilfered was an iconic 91-centimeter-high carved alabaster libation vase (circa 3500–3000 BCE) from Uruk and the carved marble female head of the same period and sacred region. The museum lootings prompted much reflection (and some excellent journalism) about the concept of historical consciousness and identity. Zainab Bahrani, in his article “Iraq’s Cultural Heritage: Monuments, History, and Loss,” wrote in some detail about the stolen Uruk vase—one of the earliest examples of narrative art—noting as well the Mesopotamian anxiety about the safety of their monuments, texts, and works of art during times of war (an anxiety about the loss of

both memory and identity, he interprets). Three days after he drafted the article, on 11 June 2003, three individuals in a battered car returned the Uruk vase to the museum.

Subsequently the Babylonian civilization flourished; under its greatest ruler, the lawgiver Hammurabi (d. 1750 BCE), sculptors created notable monuments. Babylonian dominance bowed in turn to the Assyrians, under whom artistic production reached new heights; their palace city of Khorsabad (c. 701 BCE) and later their reconstruction of Babylon, whose celebrated Ishtar gate (c. 575 BCE) is now located in Pergamon Museum in Berlin, were major centers of artistic activity in all media. Assyrian relief sculptures from Nineveh and Nimrud are now dispersed among museums worldwide.

In Anatolia, numerous civilizations with distinctive artistic traditions flourished in the two millennia before the common era. Among them were the Hittites, whose capital of Hattusas has yielded up remarkable stone and metal objects, the best of which are in the Museum of Anatolian Civilizations in Ankara. Urartians, Lydians, and Phrygians, among others, left their mark on the history of material culture in Anatolia, creating fortified cities with masonry walls and furnishing their courts with beautiful objects and well-crafted stone buildings.

The Persian Artistic Tradition

The Achaemenid Persian Empire (550–330 BCE), followed by Alexander of Macedon (Alexander the Great, 356–323 BCE) and the Seleucids (312–64 BCE), the Arsacids, (247 BCE–224 CE), and the Sasanids (224/228–651 CE), created a continuing artistic tradition that in some ways can be traced in an unbroken line from the works produced in such great early centers as Persepolis, Susa, and Bisitun down to the art of

the present day. The palace of Darius I at Persepolis (c. 500 BCE), with its huge, fluted columns and dramatic reliefs of royal ceremonies, conveys an idea of the pomp and majesty of Achaemenid court ceremony and sumptuary arts. Sasanid brick architecture was enormous in scale, as the ruins of the palace of Shapur I (250 CE) at Ctesiphon, with its huge catenary vault, suggest. Sasanid architectural and sculptural remains at Sarvistan, Taq-i Bustan, and Nakhsh-e Rostam near Persepolis, and their iconography of Sasanid kings as warriors, hunters, and lawgivers, attest to the political importance of art under the Sasanians. Numerous objects in precious metals likewise demonstrate the rich Sasanid royal iconography, while Sasanid silk weaving was in its time the epitome of beauty, luxury, and technical virtuosity in both the East and West.

Greek, Roman, and Byzantine Art in Anatolia

The Hellenic colonizers in Ionia spread the Hellenic visual culture to much of West Asia; like Greek philosophy, much of Greek art appears to have taken form in the Ionian colonies. The succession of Greek classical architectural orders—Doric, Ionic, and Corinthian—and the full repertoire of classical and Hel-

lenistic art is reflected in the excavations of Anatolian cities, from early sites such as Assos and Priene, to later Helleno-Roman sites such as Ephesus (whose temple of Artemis was one of the seven wonders of the ancient world),

This ninth-century earthenware bowl is one of the earliest examples to incorporate calligraphy as the main element of decoration. The Arabic word *ghibta* (happiness) is repeated in the center. Collection of the Metropolitan Museum of Fine Art.

Halicarnassus (site of another of the seven wonders), and Pergamon, whose magnificent Altar of Zeus (c. 180 BCE) is now in Berlin. Both in the realms of architecture and sculpture, Ionia influenced the art of mainland Greece, and its great temples were far more splendid, and constructed on a much larger scale, than most of those of mainland Greece.

Under Roman dominance westernmost Asia underwent impressive urban expansion, and prosperity led to massive investment in art and architecture. The Romans spread the Helleno-Roman style to Syria and Palestine as well as to southern Anatolia and Egypt, and cities such as Palmyra, Baalbek, and Roman Ephesus display today the most impressive remains of the art and architecture of the ancient

world. The Helleno-Roman cultural sphere encompassed indigenous peoples as well. Among these, perhaps the most famous were the Arab Nabataeans, whose great fourth-century BCE city of Petra, with its rock-cut monuments in Hellenistic style, demonstrates the pervasiveness of the classical artistic tradition. Archaeological remains from this period are found elsewhere as well, as far south as the Arabian Peninsula.

The establishment in the early fourth century CE of the capital of the Eastern Roman Empire at Constantinople was instrumental in the development of a new Christian artistic style in West Asia, especially in Anatolia and greater Syria. Drawing heavily on the technical and stylistic legacy of Rome, including the

media of mosaic and classical architectural design, the Byzantine artistic style evolved from late classicism into the Middle Byzantine style by the ninth and tenth centuries. Roman and Byzantine engineering advances, such as the barrel and groin vaults and the pendentive (the concave triangular section of wall that forms the transition between a square or polygonal space and the circular base of a dome), greatly expanded possibilities for architectural interiors; the six-domed early Byzantine church of St. John at Ephesus (c. 525) and the famous Hagia Sophia in Istanbul (c. 537) exploited that new mathematical engineering. Byzantine Syria and Palestine saw the building of such monuments as the monastery of Simeon Stylites (c. 490) and the sixth-century structures associated with the Holy Sepulchre in Jerusalem. Around the same time the Armenian states in eastern and later in southern Anatolia began a centuries-long development of their own artistic tradition of exquisite cut-stone buildings and sculpture, as well as distinctive traditions of wall painting and manuscript painting. The Church of the Holy Cross at Achtamar, from the early tenth century, is perhaps the most famous of many sculpture-covered Armenian masonry churches of the Middle Ages, and the ruins of the Bagratid capital of Ani, ravaged by an earthquake in the eleventh century, still impress visitors to this day.

Early Islam in West Asia

With the explosive spreading of Islam from the Arabian Peninsula into the Middle East, North Africa, and Central Asia following the death of the Prophet Muhammad in 632, the arts of West Asia underwent major changes. Unlike the cultures of the Byzantine and Sasanid empires, which had deeply rooted traditions of artistic images of both kings and religious figures, Islamic culture reflected the Prophet's deep distrust of figural art as potentially idolatrous and symbolic of luxury. The art of West Asia after the coming of Islam, as one might expect, therefore represents a syncretism of preexisting traditions adapted to new needs and beliefs. The first great

The Pazyryk Carpet, the oldest known surviving carpet in the world, dating from the fifth century BCE. By the late fourteenth century Islamic carpets had become an essential aspect of Europe's material culture.

Islamic building, the Dome of the Rock in Jerusalem (c. 680), reflects centralized church plans of Syria in its form and uses the Roman-Byzantine technique of mosaic in its decoration. The Great Mosque of Damascus, constructed in the early eighth century under the Umayyad dynasty (661–750), is in fact a recycled Christian edifice that was in turn converted from a Roman temple precinct. Scorning human and animal images in its public and religious art, early Islamic civilization developed the repertoire of Arabic calligraphy associated with the Qur'an, together with new adaptations of late Roman vegetal, floral, and geometric ornamentation that eventually took on the distinctive Islamic forms we today sometimes refer to as arabesque.

At the same time, in their private rural hunting lodges and urban palaces, the new rulers of the Islamic polity quietly adopted the sumptuous luxury arts and the court iconography of the Sasanid and Byzantine empires. Early eighth-century desert palaces in Syria were covered with mosaics and paintings, in some cases even including depictions

Gaspare Fossati's lithograph print from 1852 shows the interior of the gynaecium (space reserved for women) of Ayasofya Mosque, formerly the Church of Hagia Sophia in Constantinople (Istanbul), Turkey. Library of Congress.

of the hunt, genre scenes, and depictions of nude women as entertainers in the Islamic version of the Roman baths. The fall of the Umayyads to the Abbasids (749/750–1258), who moved the capital from Damascus to Baghdad, led to a period of artistic splendor chronicled in the *Arabian Nights*. The shift of the political center of gravity to Baghdad in the east also intensified the Persian cultural impact on the emerging Islamic style. At the same time, the importation of Turkic slave soldiers from Central Asia and trade with Tang dynasty (618–907) China over the Silk Roads opened the art of West Asia to influences from the north and east as well. In the prosperous towns and urban courts of east Persia in the tenth and eleventh centuries there developed

an urban middle-class Islamic art of high taste and literary sophistication, in which familiar stories from narrative poetry were often reflected in the visual arts. The famous epigraphic ceramic wares of the period show the adaptation of the art of calligraphy to ceramic decoration, with the use of aphorisms and adages to ornament lovely tableware.

The destruction of much of the early Islamic art and architecture of the eastern Islamic world in the Mongol invasions of the thirteenth century has resulted in a relatively meager amount of early art surviving to our time, which makes the splendid material culture described in the surviving historical records of the era both less accessible and more intriguing.

The Dome of the Rock in Jerusalem (close-up showing the Dome of the Chain), in a photo taken between 1934 and 1939, uses the Roman-Byzantine technique of mosaic. Library of Congress.

Eastern Invasions and Art of the Later Islamic Empires

Beginning with the arrival of the Seljuk Turks in the eleventh century, West Asia was subject to periodic waves of invasion from the east. The Mongols in the thirteenth century, the Timurids in the late fourteenth century, and the Afghans in the eighteenth century all brought a mixture of destruction and renewal to the art of West Asia. Seljuk patronage in particular resulted in a very complex and rich expansion in all media; the four-iwan type of religious structure (an iwan is a vaulted space that opens out at one end) that later enveloped the entire Islamic world from Central Asia to Morocco, began in Seljuk Iran, the eleventh-century Great Mosque of Isfahan being its first major manifestation. Art under the Seljuks and

their successors in Iran, the Jazira, and Anatolia frequently used human and animal imagery. Depictions of people, and both mythical and actual creatures, appeared in media as diverse as public stone sculpture, architectural decoration, and especially ceramics and arts of the book.

At the same time, East-West contacts developed through the crusades (beginning in 1095 and occurring periodically through 1291) further enriched both the development and the dissemination of Islamic art. Islamic media such as enameled glass, inlaid metalwork, and the ubiquitous knotted-pile carpet were traded and esteemed in Europe. By the second half of the fifteenth century, the art of West Asia had developed a truly international Islamic style found in Timurid, Uzbek, Turkmen, and Ottoman realms, manifested in the media of architectural decoration, arts of the

Every great work of art has two faces, one toward its own time and one toward the future, toward eternity. • **Daniel Barenboim (b. 1942)**

book, and luxury arts. From Samarkand to Istanbul in the north, and with reflections in the Mamluk art of Cairo and Damascus in the south, this international Islamic style flourished under court patronage. Artists and works of art moved along commercial routes with ease, and inspiration from trade with China and with Europe enriched the art of Islamic lands in many ways. By the late fourteenth century Islamic carpets had become an essential aspect of the material culture of Europe, while silk commerce between Iran and Europe via the Ottoman Empire, and trade by ship across the Mediterranean between North Africa and both the Ottoman and European worlds, resulted in an enhanced commerce of both art and artistic ideas. The Mamluk rulers of Egypt (1260–1517), with their Turkic ethnicity, language, and customs, forged artistic links with Islamic lands farther to the east, and artists freely traveled between Iran and the Ottoman lands. After 1500, the Islamic art of West Asia was dominated by two great court styles, those centered in Ottoman Istanbul and those centered in Tabriz, Qazvin, and Esfahan, the successive artistic capitals of the Safavid Empire (1501–1722/1736). Safavid Esfahan was a planned city that took form during the reign of Shah ‘Abbas I (reigned 1588–1629). Among the great artistic personalities of the age were the Ottoman architect Sinan (1489–1588), whose greatest masterpiece was the mosque of Selim II in Edirne (c. 1572), and the Safavid court painters Sultan Muhammad (flourished 1520–1540) and Reza ‘Abbasi (flourished 1590–1635). The miniature painting and other arts of the book practiced by professional artists in Islamic courts, originally intended for a very limited audience of wealthy patrons, gained wider importance because of their impact on other art forms, such as carpets and textiles with figural decoration, and architectural decoration employing the wealth of vegetal, floral, calligraphic and geometric motifs first invented in the royal painting ateliers.

Later Art in West Asia

Artistic development in West Asia from the eighteenth through the twentieth centuries was subjected

to the effects of both Eastern invasions and Western culture and commerce. European influence appears in Ottoman and Safavid painting as early as the seventeenth century, and the interplay between revivals of traditional styles and European cultural incursions continues to the present day. The eighteenth and early nineteenth centuries constitute a great age of calligraphy in the Ottoman Empire, and nineteenth-century Iranian art under the Qajars (1794–1925) led to many interesting innovations, especially in painting. In the twentieth century, traditional artistic forms were revived while simultaneously West Asian artists began to achieve reputations working in international techniques and media in architecture, easel painting, and sculpture; many of the twenty-first century’s most prominent West Asian artists attempt to achieve a fusion of Islamic tradition and modern genres and techniques.

Art—World Art Studies

World art—the objects and technologies humans have made from their earliest days to the present—provides a visual reference to stimulate the thinking of art historians and world historians alike. This interdisciplinary field studies resources and technologies of various cultures and the transmission of styles and ideas from one culture to another.

The emerging field of *world art* encompasses the study of art humans have made from the dawn of the species to the present, and across the entire globe—from Africa to Oceania and from Eurasia to the Americas. *Art* has many definitions: here it refers both to objects and techniques, especially those that produce an aesthetic response and leave some trace of their existence in the archaeological or historical record. While conventional, historical theories and methods are useful in the study of world art, many scholars involved in what they consider a burgeoning “world art movement” use an interdisciplinary approach, mining such fields as archaeology, anthropology, art history, and, perhaps surprisingly but significantly, neurobiology.

Traditional art history has long been associated with “fine art” (often meaning “art created by renowned individuals from cultures of the West”), while anthropology has been left to study the “crafts” from “non-Western” cultures and anonymous “artisans.” World art studies embrace diverse media: performance arts such as drama, dance, and music; literary arts of language and literature; installation and environmental arts; electronic arts; and visual arts such as painting, sculpture, architecture, ceramics, textiles, and jewelry. (Contemporary art history,

of course, has broadened its own realm to include many visual genres once considered nontraditional.) Because items made from tangible materials provide evidence reaching furthest back in time, the examples

For many years traditional art historians studied “fine art,” leaving the subject of “crafts” from “non-Western” cultures and anonymous “artisans” for anthropologists. Photo by Kevin Connors (www.morguefile.com).

Everything that has ever been called folk art has always reflected domination. • **Theodor Adorno (1903–1969)**

used here, in a general survey of world art studies, are objects (or visual records of objects) that survive to be seen, examined, and appreciated.

Art historians address the content, context, and meaning of such objects, as well as how, why, when, and by whom they were made, but world art historians take this “see the art in context” approach further (and deeper) to make cross-cultural comparisons. For example, fiber arts comprise textiles—wall hangings, quilts, tapestries, rugs, and cloth—as well as ropes and nets. Each of these specialties involves processes or considerations that reflect social, economic, and cultural aspects of particular groups who made them: the method or sophistication of fiber manipulation and construction (including spinning, weaving, knitting, and patterns of braiding or twisting); the resources or material available (such as cotton, silk, hemp, or flax); and the purpose or occasion of an item’s use (fishing, trading, everyday or ritual clothing). Breaking down a genre of art and analyzing the specific factors that shaped its creation can often make comparisons across cultures more significant for world historians.

Key Aspects of the Field

Since art is created everywhere in the world, world art first and foremost demonstrates the universality of human neurology and nature—our sophisticated hand-eye coordination and our ability to symbolize (that is, to have one thing “stand for” another). The historian David Christian is among those who have observed that accumulated collective learning via symbolic representation is a “driving variable” in human dominance of the planet. The field of world art examines and interprets this symbolic record: art as fact (*artifact*, from the Latin words *factum* and *arte*, literally “thing made by skill”) provides ongoing evidence of multivalent symbolic behavior and meaning that is generated and put into context over time and space.

Humans made objects long before the relatively recent time of written records; world art provides a more complete story of humanity and extends our

global, historic understanding by tens of thousands of years. As history began to unfold in text, world art continued to record evidence of human endeavors. Such visual media can be used to augment and enhance the understanding of any given historic period, and to test various historical hypotheses. World art is thus a lens through which historians can explore how individuals in a culture expressed themselves creatively, or how societies communicated values through visual representations. The world art movement’s focus—the ancient and ongoing evidence of human material cultures (art objects) and technologies (the purposes and methods of art making)—can expand the scale of study (a principle advocated by David Christian’s theory of big history) and to locate panhuman threads of inquiry.

Evolutionary psychologists have explored individual and social reasons for *why* humans made art—to signify wealth and status, to teach values or protest social norms, and to aid memory, for example—but they have also theorized that the artistic forms people originally used grew from views about the body’s role in humankind’s survival. These researchers propose that the widespread desirability of the hourglass-shaped female figure derived from its association with fertility—bearing offspring perpetuates the species—and thus spurred the earliest cultures to represent the female body using artistic materials. (Clay figurines with corpulent forms characterized by the so-called Venus of Willendorf and similar small sculptures of the Paleolithic era provide an example). Other scholars, notably Bethe Hagens (1991), dispute the idea of female fertility as the inspiration for prehistoric figurines and suggest, with convincing visual evidence, that they were modeled on animal brains.

The particularity and diversity of the objects humans have created reflect the ways in which ideas, skills, materials, or modes of representation have (or have not) been transmitted, preserved, or transformed. Thus world art supports specific studies that compare and contrast cultures by examining contemporaneous genres and techniques. Looking at tomb paintings and low-relief sculptures from the Han dynasty (206 BCE–220 CE) in China and at wall mosaics

The so-called Venus of Willendorf (24,000–22,000 BCE), a small limestone figurine discovered in 1908 near Willendorf, Austria.

in classical Rome can illuminate how two different cultures in the second century CE understood and used the concept of perspective. Portraiture in general or ritual death masks in particular might be used to compare African civilizations such as those in Benin or Egypt to tribal societies such as the Yoruba. The field of world art can also support specific area or period studies: a scholar researching the year 1000 CE might find it useful to compare variations in Islamic

and European medieval calligraphies by considering the surfaces on which the “lettering” was applied, the calligraphic styles, the colors used, or, especially relevant to a world historian, the purpose of the writing and what it revealed about attitudes toward creation and divinity.

The evolution of the Buddha image shows how Greco-Roman representations of deities were imported into the Gandhara region of India in the second through the sixth centuries CE and influenced the formation of a standardized (Gupta) Buddha image. In one fifth-century high-relief sculpture from Sarnath, Uttar Pradesh, India, for example, a slight but broad-shouldered figure stands in a relaxed, graceful position conveyed by the open-palmed gestures of his hands; the sculptural representation of a sheer, clinging robe accentuates the body’s purity and perfection. This Gupta style was modified as it traveled through Asia, so that in different countries and at different points in time, the Buddha image also reflected individual Asian cultures and styles. The monumental Buddha carved into the rock caves at Yungang (c. 460 CE, one of the earliest examples in China’s Shanxi Province), sits in a rigid pose with short, stylized “drapery” hung over his massive shoulders; these attributes exhibit a distinctly Central Asian aesthetic influence, although the elongated ears and a protuberance on the head are elements familiar to the Gupta figure.

World art thus serves as a vantage point from which historians can study resources and technologies of various cultures, the relationship of humans to the natural, spirit, or ancestral worlds, and, significantly for world historians, the transmission of styles and ideas from one culture to another.

Approaches and Resources in the Field

Thus far the emerging field of world art has relied mostly on the work of anthropologists and art historians, so interests and biases of these fields have influenced scholarship to date. The anthropologist Arnold Rubin (1989, 17) proposed his view of world art as technology: “a system of tools and techniques by

means of which people relate to their environment and secure their survival.” Rubin favored an eclectic, interdisciplinary approach to art historical surveys that would allow scholars to examine the structures in which art was produced and utilized in certain cultures, and then to “identify similarities and differences between them according to the types of social, political, and economic systems they embody” (1989, 11). The field of visual anthropology, which emphasizes the importance of visual symbols embedded in gestures, rituals, and ceremonies (as well as artifacts), focuses on the use of video and photography instead of text to document ethnography. Recently the British art historian John Onians edited the comprehensive *Atlas of World Art* (2004), a monumental landmark study that divides world art (from 40,000 BCE to the present) into seven periods, for which maps are his primary visual tools.

In addition to these approaches, world art studies benefit (and perhaps thrive the most) from the insights of neuroscientists and European social science and humanities scholars working on neuroaesthetics and neuro-art history, both of which inform world history. (Two of the key figures in this exploration are Onians and Wilfried van Damme of the Netherlands.) By starting with panhuman neurology, these researchers and scholars attempt to account for universal “givens” (for example, why shapes and color having meaning) to the variability of art in different times and places (why colors and shapes mean what they do in particular places and times). Onians uses research about mirror neurons (a biological explanation for mimesis), brain priming (when the brain sees an image and then automatically looks for it again), and neural plasticity (the brain’s neural firing patterns are altered by the very act of perception) to explain how art is perceived and created.

A new journal that will represent the field of world art as a whole—and the research being done using world art approaches—is slated for publication by Routledge in 2011: *World Art* began in March 2010 to call for research articles, essays, visual presentations, and other dialogues from world art scholars and those in interrelated fields (Taylor and Francis 2010). Several other journals relevant to world art

studies include *Res: Anthropology and Aesthetics* (from Harvard) and *Third Text: Critical Perspectives on Contemporary Art and Culture* (from Routledge). The most rapidly growing world art resources are online databases of image and text made available by museums and academic institutions, such as the collection and timeline of the Metropolitan Museum of Art in New York. For information about specific areas, scholars often turn to regional organizations. For example, to learn more about arts of Oceania, one might turn to the Pacific Arts Association or the Association of Social Anthropologists for Oceania.

Trends and Challenges

World art often dovetails with recent trends and challenges in world history, as the following three examples explain. First, both fields reject a Eurocentric approach. But the lingering influence of Eurocentrism in many traditional disciplines, and the predominant use of English and other European languages in their scholarship, often cause scholars to misinterpret the world art movement as just being about “non-Western” art made by “non-Western” peoples. Scholars even contest what it is that constitutes language and literacy in a non-Western culture. In 1450 CE, for example, the Incan Empire extended for about 5,500 kilometers and functioned, not with a phonetic writing system, but with a “language” of tied colored threads called *quipu*. The Inca communicated meanings by twisting, knotting, and manipulating the strings, as well as by denoting string color and placement. Debating, as some do, whether the art of *quipu* is a form of literacy or numeracy tends to downplay what can be learned from its use as a viable communication system.

Second, questions about how humans and their civilizations develop are central to world history and world art studies. To what extent do people borrow (or diffuse) ideas versus independently invent them? A “world art” answer to this query might be found by looking at any number of specific art objects or their constituent parts—by examining, for instance, the relations between image and text in medieval

Vincent van Gogh, *Portrait of Père Tanguy* (1887). Oil on canvas. The rise of modernism in late nineteenth-century Europe embraced Japonisme. In the background van Gogh includes some of his *ukiyo-e* (woodblock) collection, or perhaps his take on the medium.

religious documents such as the Insular Gospels in western Eurasia and Buddhist sutra scrolls in eastern Eurasia. Scholars in both fields also ask, how reciprocal are the borrowings between groups? Historically Japanese culture was itself part of a reciprocal transformation over well more than a millennium as the nobility first adopted Buddhism and next the writing and other aesthetic styles from the Asian continent; those elements spread to and eventually were entirely transformed by indigenous culture. This reciprocity is reflected in the development and subsequent transformation of Japanese *ukiyo-e* “floating world” woodblock prints, a genre that embodied the principles of transformation and renewal inherent in ancient Buddhism and shamanism. Artists over time adapted familiar subjects to changing technologies,

formats, tastes, and cross-cultural influences; cutters carved the drawings into wood; printers chose colors, inked the blocks, and transferred to paper what had essentially become a collaborative creation (Keyes 1999). Tracing the reciprocity further, Japanese *ukiyo-e* prints are widely recognized for influencing nineteenth-century European painting, but it is hard to quantify or qualify whether that influence equals the powerful impact of Western modernism on twentieth-century Japanese art.

Third, archaeologists and all art historians grapple with the same issues posed by the physical and chemical dating of artifacts (material culture) because they use the same, sometimes problematic, methodologies. Physical dating relies on finding objects “in context,” that is, in stratigraphic layers or contiguous to other excavated remains; dendrochronology (tree-ring dating) is of use only on sites where trees exist. Chemical analysis may destroy at least a part of the object and is often costly, while carbon dating of objects has recently needed to be recalibrated. For these reasons many sites and objects are without firm dates. World art historians, who tend to look at greater numbers of non-Western objects, and who put their findings in a broader comparative, cross-cultural context than traditional art historians, can find their research just as hampered by these inadequacies in dating methods as archaeologists.

Comparative Aesthetics

Appreciating the aesthetics of world art requires getting beyond the familiar Western standards and habits of viewing—the most commonplace of which has the average museumgoer spending less than thirty seconds examining a work of art. Thus many museums today take a more interactive, contextual approach to their exhibitions, especially when displaying nontraditional art forms. (Opinions vary wildly, however, about the whether “guided tours” channeled through the headsets on offer at every blockbuster exhibit are enlightening or reductive.)

World art historians nevertheless have good reason to employ standard and time-tested methodologies

of aesthetic appreciation. An analysis of formal elements and design, however traditional its approach, can still lead to the articulation and understanding of a particular style. Formal elements include line, shape (two dimensions), form (three dimensions), texture, space (types of perspective and negative spaces), colors (tints, tones, shades), and values (degrees of light and dark). Design principles include balance (bilateral or asymmetrical), figure–ground relations, texture, composition, pattern (repetition), rhythm, movement, contrast, emphasis, harmony, and unity. A formal analysis also addresses degrees of reality versus illusion, and naturalistic rendering versus abstraction. Comparisons of aesthetic styles between cultures—drawings by ancient Mesoamerican artists and those of the Egyptians, for instance, reveal a similar composite perspective of the human figure, in which the head, arms and legs appear in profile while the torso is depicted in a frontal view—can lead historians to explore whether such patterns across cultures developed independently or interactively.

Ideas of “beauty,” (that is, what constitutes the aesthetic) have varied in different times and places. In

the first century CE, Longinus’s treatise “On the Sublime” proposed that aesthetics was the *experience* of beauty. Contemporary descriptions of aesthetics now include any emotional response to art and emphasize empathy between those who make the objects (or participate in events) and those who more passively view them. Beginning students and the general public might achieve this empathy by exploring another art form related to the object or the culture that produced it. For example, Western eyes may be unfamiliar with Australian “dreamings” paintings in which hundreds (even thousands) of dots are arranged in circles, spirals, and lines that evoke an aerial (if not spiritual) view of the Australian landscape as it was once traveled by Aboriginal ancestors or otherworldly beings. Such viewers might enhance (or possibly diffuse) the visual sense of “otherness” in these “dot” paintings by using their ears—that is, by listening to music played on a didgeridoo (an indigenous wind instrument developed at least 1,500 years ago). Such cross-sensory exposure, especially when it involves an aural art form capable of eliciting an emotional response, can serve as a tool to sharpen awareness

Contemporary Australian “dreamings” paintings, inspired by cave drawings such as this, use dotted circles, spirals, and lines to evoke an aerial (if not spiritual) view of the landscape traveled by Aboriginal ancestors or otherworldly beings. Photo by Kevin Connors (www.morguefile.com).

Art is a kind of innate drive that seizes a human being and makes him its instrument. To perform this difficult office it is sometimes necessary for him to sacrifice happiness and everything that makes life worth living for the ordinary human being. • **Carl Jung (1875–1961)**

of other unfamiliar customs, practices, and traditions of an indigenous culture.

The Future of World Art Studies

Encouragement for the field of world art as an expressive communication and/or information movement is accelerating and expanding through both widespread tourism (actual and virtual) and other online resources. Visual and auditory global exchanges are commonplace, and new art fields, such as “visual culture and world art,” are growing. Art education and organizations around the world show an increasing interest as public art (art displayed and performed in public places), community art (art made collaboratively within and by communities of people), and individual artists in their studios increase their use of technology in the twenty-first century. World art thus fits the temper of the postmodern age as it supports teaching diversity and accommodates multiple intelligences. (See Howard Gardner’s *Multiple Intelligences* [1993], which explores the theory that individuals possess a unique blend of several types of intelligences—linguistic, musical, and body-kinesthetic, to name a few.)

The most fervent of world art supporters believe that the field has the potential to become an educational axis mundi. In the meantime, world art studies can stimulate the thinking of both art historians and world historians.

Art—World History and Art

World history, almost by necessity, is often interdisciplinary in its approach and research methods. So far, however, it has not connected very closely with the visual studies disciplines, especially art history. Some recent scholarship suggests this might be changing and non-textual evidence will play a larger role in how we see world history.

The great pioneers and popularizers of world history in the first half of the twentieth century—Arnold Toynbee in *A Study of History*; Oswald Spengler in *The Decline of the West*—reified the visual arts as a unique expression of the animating spirit of the “Great Civilizations,” whose rise and fall was the core of world history. Art measured and reflected those life cycles.

The new world history taught in the United States since the 1960s has largely abandoned a separate-civilizations approach to world history in favor of interconnections and comparisons, especially more material ones—trade, the transfer of technologies, the spread of disease, and impacts on the environment. The importance of art in this new context has consequently declined. Does art have any significant role to play in world history in the twenty-first century other than as textbook illustration?

Art: Illustration or Content?

In his enormously influential though misleadingly titled *The Rise of the West* (1963), a comprehensive one-volume survey of the entire human past, William H. McNeill strove to give art and visual material a meaningful presence in a global narrative that

still used civilizations as its basic building blocks but made cultural diffusion between civilizations the real motor of historical change—with art being a prominent part of that story. McNeill not only insisted on illustrations—these were lesser-quality, black-and-white photos compared to the lavish color that would become de rigueur once world history had established a large textbook market—but they were tightly linked to the historical narrative. He also made his publisher (University of Chicago Press) commission the Hungarian-born artist Bela Petheo, who drew a series of diagrammatic maps and sketches to convey some of the book’s interpretations and narratives—particularly those having to do with contact and diffusion. Petheo’s illustrations combined words and symbols with the gestures of, and the spatial relationships among, simply rendered human figures.

Subsequent world history textbooks, including McNeill’s, developed the use of art as illustration but seldom as an integral part of the narrative itself. As material history became more important the emphasis on nonmaterial culture declined. Illustrations functioned more as vehicles to break up large blocks of text, and the lessons art could teach about history, including the history of cultural diffusion, seemingly diminished. When McNeill co-authored his next venture into macro-history, *The Human Web* (2003), art had shrunk to a few passing one-line references. This is not so surprising, for the many subjects McNeill tackled in influential books and lecture series during the years after *The Rise of the West* dealt with “harder” fields of history—military power, demography, disease, and the environment, for instance—topics seldom interpreted through the visual enhancement (or evidence) provided by art.

Johannes Vermeer, *Officer and Laughing Girl* (c. 1655–1660). Oil on canvas. The beaver fur hat inspired the title for Timothy Brook's episodic study on the effects of seventeenth-century trade. The Frick Collection, New York.

This should not be interpreted as criticism. It reflects the general interest of McNeill's time in questions of economic development, of power and organization, and of material culture. The other influential world historians of the last fifty years, from Leften Stavrianos to David Christian, pacesetters in the development of world history as a respectable field of intellectual inquiry, followed similar paths, or rather blazed new trails, but none explored the visual dimensions of world history. Patrick Manning's *Navigating World History: Historians Create a Global Past* makes this point clear. Manning's volume, which in his preface he calls "an overview and critique of world history as a field of scholarship and teaching" (2003, ix), includes a chapter called "Cultural History." A discussion of nonmaterial culture is part of that chapter, but it draws heavily on anthropology; so art is once again marginalized—not necessarily because of any anti-artistic prejudice on the part of

the author—but perhaps reflecting the author's Africanist background.

World History Research: Where is the Art?

Surveying research publications in the field of world history one finds very few books, monographs, or scholarly articles by historians that have anything to do with art. The *Journal of World History*, an official publication of the World History Association, has run exactly two articles with an art theme—"The Pilgrim's Art: The Culture of Porcelain," and "Weaving the Rainbow: Visions of Color in World History," both by Robert Finlay—in its twenty years of publication. A newer journal, the U.K.-published *Journal of Global History*, appeared to be following the same track in its first four years until in the July 2009 issue it published "Dionysus and Drama in the Buddhist Art of Gandhara," co-authored by the art historian Pia Brancaccio and the world historian Xinru Liu. The article is a model of what interdisciplinary scholarship can do to draw more cultural and social history out of a topic, especially one so well covered as Greek influence (between the first and third centuries CE), in what is now northern India and eastern Afghanistan. But its interpretive use of artistic evidence (sculpture) is very much the exception in world history research.

One other seeming exception should be mentioned. Timothy Brook, a globally conscious historian of Ming China, takes the seventeenth-century Dutch artist Johannes Vermeer as the starting point for his 2008 book, *Vermeer's Hat*. But the art is almost incidental to the episodic story Brook tells of how in the seventeenth century the European search for the riches of the Orient, with China at its center, started to build the interconnected world of modern times. He focuses on one small object in several paintings (the beaver fur hat of a Dutch officer in one of them provides the title), to explain where these items came from and the history of how they got to Holland—from the opening of the New World and the exposure to furs, tobacco, and silver; to trade with Asia and the spice islands; and to changes in European customs, habits, and life styles. It is definitely world history

told with grace, charm, and wit. But it does not use the art to explain the history; it is not world history as seen through art.

A more recent but better example of the historian crossing over into art history—but still asking world-history-type questions about complicated cross cultural connections or networks—is Robert Finlay’s book (expanding on the article mentioned above) *The Pilgrim Art: Cultures of Porcelain in World History*. He traces the invention of true porcelain in China, explains why other pottery-making cultures (and who didn’t make pottery?) had such trouble matching the Chinese combination of extremely high kiln temperatures and special types of clay seldom found elsewhere, and why this created a unique worldwide trade network when European maritime expansion connected all the continents. Most significant for cultural history, fine porcelain was an artistic product that carried all kinds of cultural baggage. East met West, China and Europe but also everywhere in between, in the pictures and designs on a Chinese china cup. It is the furthest we have come so far in making art a meaningful part of truly global history.

Still, when we turn from the research monographs to the world history textbooks it is apparent that much more needs to be done. Despite attempts at stimulating interest with attractive illustrations and graphics, they seldom integrate the art or explain why it was created, who its intended audience was, or what impact it had on the history being illustrated. In fact, rarely is any information given about the artist, or even the present location of the work of art, making art seem more like eye candy than an aspect of history. The frequent use of sidebars or “insets” to explain an illustration further separates the visual from the historical narrative rather than integrating it.

There are, of course, some exceptions: mainly textbooks that move away from the more conventional area-by-area chronology toward thematic organization. A pioneering text of this type, Kevin Reilly’s *The West and the World: The History of Civilization from the Ancient World to 1700*, makes a serious effort to integrate art into the history rather than just decorate it. From erotic painted scenes on ancient

Greek vases in his chapter on “Love and Sex” to his final chapter on “Citizens and Subjects,” he uses a range of visual material to illuminate major social, political, and cultural developments. (A subsequent edition published in 2003 brings the reader up to the twenty-first century and ends with the chapter “Identity and Global Culture.”)

An even more thematically organized text, *In the Balance: Themes in Global History* by Candice Goucher, Charles Le Guin, and Linda Walton (1998), has several special sections on the arts. For instance, “The Deadly Arts: Expressions of Death in World Arts before 1500,” ranges around the globe to touch on religious and cultural beliefs surrounding this universal human dilemma. Another section, “Cultural Creativity and Borrowed Art,” meaningfully illustrates the fundamental theme of the new world history—cross-cultural borrowing and innovation.

Still, even these textbooks only scratch the surface of how it is possible to use art—and especially in these modern times, a broader visual culture—for historical analysis. But this will only be possible when the research side of world history generates more articles, monographs, and detailed case studies showing where and how art can be integrated into world history.

This rather negative appraisal of the presently existing role of art in world history scholarship needs to be balanced by two other factors: (1) the greater presence of art and visuality in the teaching of world history, and (2) the potential for help from other academic disciplines.

Art In the World History Classroom

Two publications indicate that art is finding a more prominent place in world history classrooms. In 1997, Heidi Roupp, a high school teacher and president-elect of the World History Association, edited a volume called *Teaching World History: A Resource Book*, part the M. E. Sharpe series *Sources and Studies in World History*. Of the fifty essays on teaching strategies and resources, three involved visual art. Although 6 percent may not seem like a large share,

it is significant compared to the *Journal of World History*'s record of two art articles in twenty years (less than 1 percent). It also is significant that the other WHA publication, the *Bulletin of World History*, more teaching-oriented than the *Journal*, does intermittently have articles dealing with art's role in world history education. That, as well as the greater interest high school teachers show in art panels at the annual and regional meetings of the WHA, seems to indicate that a movement to put more art in world history might come more from practice (teaching) than theory (scholarly research).

But this contradicts one of the fundamental principles of the WHA and the world history movement in general: the teaching needs to be informed by new scholarship and the scholarship should be relevant to the teaching. Since world historians are not producing much scholarship on art in world history, where will such research come from? The most hopeful source may be other academic disciplines with a better eye for nonwritten sources.

Interdisciplinary Solutions?

World history has always been undisciplined—that is to say, not confined within the bounds of normal academic history. The key historians in the intellectual evolution of the new world history all drew ideas and data from other disciplines: William H. McNeill from cultural anthropology, for instance, and the world economic historians—Kenneth Pomeranz, Bin Wong, and Andre Gunder Frank—from economics. David Christian, for his *Big History*, the twenty-first-century continuation of the meta-history tradition, turned to the natural sciences: evolutionary biology, geology, and astronomy. Is there, then, hope that other academic disciplines might bring more visuality to world history? If so, why hasn't it already happened? To some extent it has.

Archeology

The broad vision of world history, going back at least to the agricultural revolution and preliterate societies,

means that archaeological evidence has been essential for reconstructing the distant global past. Few, if any world historians, have got their own fingers dirty at digs, but they have certainly made use of what archaeologists have uncovered, from crude stone and pottery "Venus figures" in Paleolithic Europe to lost cities in Africa or ancient graves along the Silk Road(s). The new journal *Silk Road* is a particularly rich source for archaeologically discovered evidence of trans-Eurasian contacts and cultural exchanges.

But the most startling recent research on pan-Eurasian patterns and possible connections goes back long before silk linked the far parts of what William H. McNeill called "the global eucumene." Two philologists, Victor Mair and Miriam Robbins Dexter (2010), have produced a little book, *Sacred Display: Divine and Magical Female Figures of Eurasia*, with startling implications about the prominence of the feminine in very ancient Eurasian religion and society from China to Scandinavia. Their research uses textual as well as visual evidence, but the book is a striking example of what can be done when text and image are combined and disciplinary boundaries are ignored.

For modern times, with such variety of art and its intermixing in the age of globalization, cultural anthropology is the field that has done the most significant work. In studying mainly nonliterate small societies, anthropology has always turned to art as a vital part of "symbolic culture" and has been global in its scope. More recently, realizing that autonomous native cultures were almost all involved in global exchanges, cultural anthropology has looked at the interaction between different societies and cultures—exactly what world history does—but has given more focus to art than world history has. It has been to world history's disadvantage that there has not been more dialogue between the two disciplines. The recent volume of collected essays, *Exploring World Art* (Venbrux et al. 2005), would be a good place for world historians to begin, even if most of its case studies deal with small societies—the Sepik River valley in Papua New Guinea, for instance, not China or Japan.

Cultural, Visual, and Media Studies

Some anthropologists look at art in larger societies, and they are in much closer touch with the new fields of cultural studies, visual studies, and media studies than most historians are. Those fields, products of the age of an electronically interconnected world, would seem to be more promising for world history than has been the case so far. But from a world historian's viewpoint most of their intellectual production has been disappointing or irrelevant. There are several reasons for this.

First, the scholarship is so heavily suffused with theoretical concerns—poststructuralist, Lacanian, psychoanalytic, deconstructivist—that they literally speak a different language, one foreign to most practicing world historians. More seriously, as the polymath art historian and world art theorist James Elkins has lamented (2003, 36), they show very little interest in “history,” that is, what happened before the advent of electronic images. And finally, a problem for fact-grubbing historians, there is very little first-hand research on non-Western visual cultures in the new fields' leading journals, which are long on postmodernist theorists and short on facts or even images.

World historians should not ignore these new fields of inquiry into global culture, especially when they are really global, but the most likely source of help with visual evidence still lies in art history. How promising is that older and well-established discipline as a source of allies, ideas, and material?

Art History

Although “world art” as a conscious intellectual enterprise and curriculum component is still very much in its infancy, the last few decades have seen considerable changes in the way art history is conceptualized, researched, and taught. Most relevant for world history, it has become less Eurocentric and less focused on stylistic development and “great artists and masterpieces.”

The extent of this progress should not be exaggerated. Many art history surveys and textbooks now

incorporate the word *world* into their title as global consciousness spreads along with economic and cultural globalization. But coverage is still much more comprehensive for the Western canon, from Mesopotamia and Egypt, through Greece and Rome, the Middle Ages, Renaissance, modern Europe, and America. “The rest”—almost all of Asia, Africa, pre-Columbian Americas, Australia, and Oceania—on average gets one-quarter to one-third the total number of pages. Still, this is a considerable improvement over just a few decades ago.

Global coverage in itself may not be terribly useful for a world history agenda. Often written by multiple authors, these thousand-page or more tomes are organized by era and area with not much attention to connections and comparisons between them. That is not to say that the diligent world historian cannot find some examples to use in illustrating cultural contact between different civilizations. Almost all the art history textbooks discuss, more or less adequately, Greco-Roman influence in Gandharan Buddhist art and its spread from northern India to China as one of the most striking cases of long-distance transmission of artistic style and ideals. Similarly, *japonisme* usually figures prominently in the rise of modernism in late-nineteenth-century Europe.

Still, these beautifully illustrated textbooks and the online image banks designed for art history are strongest on the Western art canon, not yet free of “the West and the rest” approach. They remain more useful as a source of illustrations for teachers and scholars of world history. For ideas, world historians will have to search through some of the newer trends and publications in art history.

The two leading professional art history journals, *Art Bulletin* in the United States and *Art History* in Great Britain, still publish heavily on “Western art.” Since the 1990s, the number of articles on other parts of the world has risen to about 12 percent of the total, far less than in the textbooks, which give more weight to course enrollments than art historians' professional interests. More to the point, however, very few articles in that 12 percent touch on the themes of cross-cultural contacts and comparisons which are

so important to world historians. Conceptually, the discipline of art history still seems uninterested in a global approach. But is it?

Perhaps more than history, art history is a discipline in the throes of theoretical change. Much of this theory—semiotics, poststructuralism, and so forth—seems irrelevant for down-to-earth, fact-seeking, narrative-constructing historians. Since the turn of the century, however, there have been several major works by prominent art historians that attempt new approaches to “global art.”

John Onians and his School of World Art Studies at East Anglia University (in the United Kingdom) may be the most significant for world history. His massive, multi-authored *Atlas of World Art* is more truly global in its coverage than any of the standard art history textbooks. Whether or not world historians find his neurologically based theory of universals in art useful, they could benefit from his pioneering work in the discipline of art history.

More active in Europe than America, the world art studies “movement” is very broad in its vision, encompassing the world from the earliest paleo-archaeological evidence of hominid artistic creation to the present, and all relevant disciplines from philosophy to neurobiology. Judging from published essays deriving from a number of workshops held at the University of Leiden—in a 2008 volume, *World Art Studies: Exploring Concepts and Approaches*, edited by Kitty Zijlmans and Wilfried van Damme—cultural anthropology seems to be the closest ally to world art history. There were no historians included, perhaps more a comment on historians’ lack of interest in the visual than any exclusion by world art studies.

On the other side of the Atlantic, two American art historians have seriously engaged the problem of a global art history on the theoretical level. David Summers, in *Real Spaces: World Art History and the Rise of Western Modernism* (2003), tries to come to terms with what new theories of the visual and heightened global awareness mean for the study of art history. He believes those different “real spaces” around the world can be brought into a non-Western-centric universal art history. James Elkins, equally

dissatisfied with the lingering elitist and culture-bound narratives of art history in the West, is much more skeptical about the possibility of constructing a universal narrative out of the world’s various traditions of art and art history. Of his many publications, *Stories of Art* (2002) is probably most relevant for theories of world art history and, by implication, world history.

Three Rubrics for Research

This kind of new thinking by art historians such as Onians, Summers, and Elkins is important for connecting art history to world history, but practicing world historians might find more limited studies that examine specific cases of cross-cultural contacts and comparisons more immediately useful. Much of this closely focused research comes from younger art historians and fits easily under the three large rubrics of world history research—connections, comparisons, and global patterns.

Connections

A few examples of “connections”—cross-cultural influences in art, especially where the art is part of larger cultural, economic, and even political patterns—follow.

The Silk Roads, networks of trade and travel linking East Asia with western Asia and Europe, figure large in both world history and recent art history. The roots of this Western romance with the caravan routes go back to late-nineteenth-century European explorers like Sven Hedin and Aurel Stein, who brought the desert-preserved artistic and archaeological treasures of Central Asia to the world’s attention. More recent archaeological work and art studies have shown how much cultural contact flowed through central Asia on the long-distance trade routes. The artistic record for the transmission of Buddhism from its northern Indian birthplace to East Asia is well known, but new discoveries suggest far more contact between China and Europe in the Middle Ages than had previously been imagined. (The journal *Silk Road* publishes

much of this scholarship.) Lauren Arnold describes in detail one particular “Silk Road journey” in her book *Princely Gifts and Papal Treasures: The Franciscan Mission to China 1250–1350 and Its Influence on the Art of the West*. For influence flowing the other way, Arnold has shown how the image of the Virgin Mary with the baby Jesus, brought to China by fourteenth-century Franciscan missionaries, was transferred into Chinese portrayals of the child-giving goddess, Guan Yin.

The question of Chinese contributions to European Renaissance art is still contentious with

most art historians not accepting Arnold’s views or those postulating Chinese influence on Giotto published earlier by the Japanese art historian, Hidemichi Tanaka. But mainstream Western art history has recognized that the Renaissance was not entirely a European affair as several well-received books have appeared in the last decade or so showing the connections in art, architecture and culture between Italy, particularly Venice, and its Eastern Mediterranean trading partners in Istanbul, Cairo, and elsewhere. (See Jerry Brotton’s *Renaissance Bazaar*, 2002, and his collaboration with Lisa Jardine,

Lauren Arnold, author of *Princely Gifts and Papal Treasures*, noticed a striking similarity between a scroll (left) signed by Tang Yin (1470–1523) and the famous eighth-century painting (right), *Salus Populi Romani*, in Rome’s Santa Maria Maggiore. Most likely missionaries had carried a copy of the iconic Roman work to China, where Tang Yin was inspired to adapt the image of the goddess Guan Yin in his portrayal of the Virgin Mary. Nishio Conservation Studio.

Global Interests: Renaissance Art between East and West, 1996).

In the ensuing age of European maritime expansion these cross-cultural connections expand beyond the Silk Roads and the Mediterranean to become global, especially with the spread of the Jesuit mission. *Art and the Jesuit Missions in Asia and Latin America, 1542–1773*, by Gauvin Alexander Bailey (2001), and *The Jesuits and the Arts*, edited by Bailey and John W. O'Malley, deal with the visual arts in this premodern occurrence of globalization. Another art historian, Michael Sullivan (1973), looks beyond the Jesuits and brings the interchange between European and East Asian art (Japan as well as China) up to the twentieth century in his pioneering study *The Meeting of Eastern and Western Art*.

In the four decades since Sullivan's broad-gauged survey, other art historians have conducted more focused research on particular cases of East–West contact and intra-Asian interactions. One example is the work of Aida Wong, now a resident in the United States but significantly from Hong Kong, that meeting place of international and transnational influences. Wong's recent book, *Parting the Mists: Discovering Japan and the Rise of National-Style Painting in China* (2006), internationalizes the art history and cultural history of twentieth-century East Asia. A shorter work of Wong's, "Landscapes of Nandal Bose (1882–1966): Japonism and Populism in Modern India," published in *Shadows of the Past: Okakura Tenshin and Pan-Asianism* and edited by Brij Tankha, is even more clearly world history, or world history through art, with its revelations of how pan-Asian thought arose in reaction to Western colonial dominance.

Later in the globalized twentieth century, these connections are even more obvious. To take just three of many art histories dealing with East–West artistic interchange in the last century, there is Shiji Takashima and Thomas Rimer's *Paris in Japan*, published by the Japan Foundation in 1987; Partha Mitter's *Art and Nationalism in Modern India* (1995), and Liliane Karnouk's 2004 study *Modern Egyptian Art, 1910–2003*.

Utagawa Sadahide (1807–1873). This *ukiyo-e* style Japanese print shows a Dutch family along the shoreline in Yokohama; a Dutch ship is at anchor in the background. As an example of a European subject rendered in traditional Japanese style, the print attests to the East–West cultural exchange. Library of Congress.

Such studies can contribute significantly to world historian's efforts to trace the emergence of global styles, global culture, and the complex questions of cultural identity they produce. This is also the area where visual and cultural studies may be most useful, and world historians should not ignore the work on small societies by cultural anthropologists well represented in the essay collection, *Exploring World Art* (Ventrux et al. 2006). Beyond the small societies and tourist art described in those essays, there are other examples of globally circulating pop culture and art, such as the

spread of Japanese anime and other elements of cross-Pacific pop largely through the Internet.

Comparisons

Comparative studies, at least in art, are less popular than they once were and perhaps not as obviously useful for world historians looking for a “web” of global connections rather than distinctly different civilizations. In 1954, the Harvard art historian Benjamin Rowland wrote in the introduction to his little book (at 140 pages, it’s an easy-to-handle volume compared to some of its thousand-page successors), *Art in East and West: An Introduction Through Comparisons*, that he was looking for, “accidental parallels . . . not designed to illustrate the influence of one culture upon the other” (1954, vii).

Since then, awareness of cultural influences has grown and broad categories like “East” and “West” have been much refined. But there still are comparative questions where the interests of the art historian, the social scientist, and the world historian overlap. How, in different societies at different times, does art work as an instrument for cultural cohesion, religious belief, and political control? Answering such questions requires some understanding of “style” (the language of art), as well as of social theory. For instance, look at monumentality and political authority in both the sphinxes and pyramids of Pharonic Egypt and the relief sculpture of ancient Mesopotamia—or, for the modern revolutionary period, how art was used to mobilize and indoctrinate the masses in Fascist Italy, Nazi Germany, Soviet Russia, and Communist China. (See Igor Golomstock’s 1990 book *Totalitarian Art*.) Religion, of course, is another promising field for an interdisciplinary approach: the ideological functions of icons, holy sites and architecture, art and the missionary enterprise—all the numerous areas where art is a basic source for the history of belief.

Global Patterns

Finally, stopping just short of meta-projects (Onian’s atlas or Summers’ global art theory) there is the search

for global patterns. There surely are others, but one of the most obvious is the virtually worldwide spread of post-Renaissance Western “realist” art in the late nineteenth and early twentieth centuries when, from Teheran to Tokyo, or from Moscow to Bangkok, it was seen as an essential component of modernity. (See John Clarke’s 1998 work, *Modern Asian Art*.) Closely behind that wave of Westernization comes the fusion of art and identity politics in the postmodern, postcolonial era. These are not national topics, and they are not just art history topics.

At the other end of recorded history with the emergence of cities, states, and empires there may also be similarities in the functions of art that go beyond comparison of the particularities of form and style. There may be patterns, if not one line of development, and art may be the key to unlocking them. Again, it is essential for world historians to engage in dialog with archaeologists and art historians, not just read the results of their research. Art and visual evidence in general are too important, too relevant to history everywhere to be neglected as world history goes forward in its task of creating a global past for an increasingly globalized future.

Asia is the birthplace of some of the world's oldest civilizations. Despite studying the great diversity in religion, culture, geography, economy, and language, which has given (and still gives) rise to conflict, world historians examine how cultural exchange among Asian peoples helped to preserve their individual traditions.

Asia is the world's largest, most populous, and most culturally diverse continent. It combines extremes of height, depth, temperature, rainfall, humidity, aridity, and population density. People speak hundreds of languages from one end of Asia to the other. It contains different forms of human relationships to the land, including sparse but mobile pastoral groups, desert and jungle dwellers, large agrarian economies, powerful systems of interregional trade, and lately huge industrialized regions. It includes some of the world's fastest-growing nations as well as some of its poorest and most backward.

We can divide Asia into six basic cultural regions: (1) East Asia is dominated by China and Japan. (2) Southeast Asia is a region of island and peninsular countries and has no one dominant country or culture. (3) South Asia is dominated by India but houses Islamic and Hindu cultures. (4) Central Asia includes Iran and several countries formerly belonging to the Soviet Union. Persian (Iranian) culture has significantly influenced this region, as has the interaction between Sunni Islam and Shi'a Islam. (5) West Asia (excluding the Arabian Peninsula) is mostly successor states of the Ottoman Empire and post-World War I British and French protectorates. Turkey, Iraq, Israel, and Saudi Arabia are key countries in this oil-rich but politically troubled region. (6) North Asia is Russia. A

question here is whether the curve formed by the Ural Mountains, the Ural River, the Caspian Sea, and the northern slopes of the Caucasus Mountains separates "European" Russia from the much larger Russian domain east of this line. In his study of Asia's lands and peoples George Cressey argued that this demarcation made little sense agriculturally or economically. But geographers recognize it because of the West-East political and cultural stance adopted by Russian elites since the time of Czar Peter the Great.

From the perspective of world history the critical areas to look at first are those of West Asia, South Asia, and East Asia. Apart from Egypt and Nubia, these are the areas that gave birth to the earliest major civilizations. The civilization of Mesopotamia, developing around the valleys of the Tigris and Euphrates rivers, formed the matrix from which arose the Abrahamic religions of Judaism, Christianity, and Islam. These Asian religions and their peoples have exerted a huge impact on world history as both actors and victims.

Because of the antagonisms that developed among followers of these religions, many people see them as irreconcilable forces accounting for the clash of empires and nations and the rise and decline of civilizations. Certainly the divisions run deep and continue to influence the history of our times. Christianity and Judaism turned against each other during the later first century CE, beginning a long trail of suspicion and hatred that led up to the Holocaust of World War II. For eight centuries Christian and Islamic forces fought over control of Andalusia in Spain. Crusaders stormed Antioch and Jerusalem in 1098–1099, indiscriminately killing Muslims and Jews as infidels. Turkish Ottoman rulers conquered Constantinople

(Istanbul in modern Turkey) in 1453, terminating the Byzantine Empire and converting the Hagia Sophia (holy wisdom) church into a mosque. They sent armies into battle in eastern Europe, seeding Islam in the Balkans and laying the groundwork for Serbian resentment and slaughter of Muslims in Bosnia and Kosovo during the 1990s. Between 1894 and 1915 Ottoman forces persecuted Christian Armenians, culminating in the massacres of Armenian refugees in 1915. Reverberations of Christian–Islamic antagonism can be seen in the Soviet occupation of Afghanistan during the 1980s and the war in Chechnya today. Today seemingly intractable conflicts involving Christian, Jewish, and Islamic armed forces are continuing in Israel, Palestine, and Iraq.

The task of history, however, is not just to account for differences but to examine broader themes represented by these profoundly influential religions and the cultures and people who subscribe to them. These religions all adopted an approach to monotheism of which Abraham is widely regarded as the first exponent. They are advocates for certain values that include adherence to a divine creator, adoption of various sacred texts embodying the norms of Abrahamic monotheism, commitment to justice and mercy in human relations, and almsgiving to the poor. They have given rise to some of the world's most magnificent art, architecture, gardens, poetry, romances, philosophic reflection, and historical inquiry. Despite all the mutual destruction, they have engaged in trade, intermarriage, and cultural exchange and in various ways preserved each other's cultural traditions.

During recent years historians have begun to reexamine such common themes and to recognize their benefits to people living all over the world. Most practitioners of the Abrahamic religions are still far from embracing these commonalities. In this respect the global history of the last two hundred years, with its rising theme of Western disdain for, and exploitation of, a supposedly stagnant Asia, has not been conducive to better mutual understanding. Thus, an urgent task for contemporary world historians is to identify texts, historical eras, and personalities that facilitated the practice of positive values and exchanges between

Islam, Judaism, and the Christian West, as well as to clarify when and why such exchanges were abandoned and at what cost.

Earliest Civilization

The early history of south Asia presents another matrix for viewing the course of world history. The earliest civilization emerged along the Indus River, where researchers have uncovered the remains of splendid cities rich with artifacts. Unfortunately the written materials unearthed do not include substantial texts and have not yet been deciphered. Until fairly recently experts assumed that this culture was overrun during the middle of the second millennium BCE by Aryan peoples migrating from Central Asia. However, now more experts argue that natural calamities are more likely to have been the main cause for the abandonment of the Indus communities and that a cultural break did not necessarily occur between the people of that culture and the people who created the Vedic literature (relating to the Hindu sacred writings) and traditions identified with the Ganges River valley. If this argument holds, it will confirm a continuity of civilization in the Indian subcontinent going back five or six thousand years, which would in turn help to explain the reverence and tenacity with which so many Indian people subscribe to the texts and traditions of Hinduism.

In viewing world history from this region, one noteworthy theme is the rise and diffusion of Buddhism. Inspired by the life and teachings of the Indian philosopher Siddhartha Gautama (c. 560–480 BCE), Buddhism took root in northern India and developed rapidly under the reign of the Mauryan king and Buddhist convert Asoka (reigned 273–232 BCE). Gautama (known as the Buddha) taught a spiritual practice for gaining liberation from suffering that addressed universal human conditions and thus could be applicable in other cultural settings. As a religious convert, Asoka put the teachings of Gautama into action and sent missionaries to Kashmir, south India, Ceylon (Sri Lanka) and Burma (Myanmar). The historian H. G. Rawlinson described these missions as “amongst

A sixteenth-century Chinese painted wall molding with elements from Daoism and Buddhism, two major Asian religions. Photo by Chris Howell.

the greatest civilizing influences in the world's history." Theravada Buddhism, the earliest form of this religion, gradually extended farther into Central Asia and peninsular Southeast Asia.

During the reign of the great Central Asian Kushan king Kanishka (reigned c. 120–162) a new and extended form of Buddhism (Mahayana) came into being. Empowered by doctrines of redemption and rebirth it spread into Central Asia and thence to China, Korea, and Japan, carried partially by Central Asian missionaries but also by traders. The famous grottoes in Dunhuang in northwest China (in Gansu Province) attest to the extraordinary faithfulness of these practitioners, their ability to transcend unbelievable hardships en route, and the sophistication of their visions of human potential. This vision and energy can still be encountered among Buddhist practitioners throughout East Asia. Thus, they invite historians to understand how religious transmission can overcome cultural barriers, survive hostility and opposition, and integrate into cultures with different historical traditions.

A third form of Buddhism (Tantric) made its way across the Himalayas to Tibet, Mongolia, and parts of eastern Russia, where it continues to flourish. The dispersal of Tibetan people throughout the world since

1959—when eight years of occupation by China culminated in an uprising that led to the exile of Tibet's spiritual leader, the fourteenth Dalai Lama—has attracted considerable attention to Tantric Buddhism. The provocative visual symbology of Tantrism, its intense rituals and extremities of devotion (exhibited in the grueling kneeling and prostrating pilgrimages to Lhasa and Mount Kailas in Tibet), and its adherence to doctrines of karma and rebirth represent a challenge to the materialism pursued in both East and West. This challenge is still in its early days, and its impact remains to be determined.

Ironically Buddhism lost ground in India to a reviving Hinduism and to invasions by Islamic armies who laid waste to Hindu and Buddhist communities during the eleventh and twelfth centuries. More than 400 million Muslims now live in the Indian subcontinent, alongside 700 million or more followers of Hinduism. This has been an uneasy cohabitation. At its height the Islamic Mughal dynasty under Akbar (reigned 1556–1605) and Shah Jehan (reigned 1628–1657) provided a civilized and in many ways enlightened regime, of which the most famous legacy is the sublime Taj Mahal in Agra, India. Unfortunately, times have changed. Since the end of the British Raj (rule) and the partition of India in 1946, millions have died

This *ukiyo-e* (woodblock) print by the Japanese artist Ando Hiroshige (1797–1858) shows a large paper lantern hanging in a gateway that leads to the Kinryūzan Temple in Asakusa. Library of Congress.

in civil war, in religious confrontations, and in the ongoing war in Kashmir. The conflict between India and Pakistan—now both nuclear powers—continues to threaten world stability. The lack of understanding about India in the United States and the unwillingness to admit the extent to which religion can drive political agendas are problems that need attention if this threat is to be diminished.

Chinese Civilization

China also enjoys five thousand or more years of civilization. Its unique writing system emerged during the early to middle years of the second millennium BCE.

The doctrine of the Mandate of Heaven, through which a ruler's right to power was sanctioned by a divine being, began to take shape at the beginning of the Zhou dynasty (1045–256 BCE) during the eleventh century BCE, and the earliest poetic and historical documents followed not long after. From these early traditions emerged the philosophies of Confucianism and Daoism, which have done so much to shape political and cultural thinking in China and also in Korea, Japan, and Vietnam. From Confucianism emerged the systems of education and bureaucratic management through which China's agrarian empires were managed and its histories produced, and from Daoism came the investigation of being and nonbeing through which Chinese were able to practice ways of living that were an alternative to those required in the public arena. These alternative images of existence, onto which Mahayana Buddhism was superimposed, enabled Chinese culture to survive repeated fluctuations of expansion and contraction, including subjugation by foreign peoples, and to maintain a distinctive world perspective to the present day.

From the viewpoint of world history one can explore various themes in the Chinese context. One theme is the interaction between nomadic pastoral cultures and the powerful agrarian state that grew up around the Huang (Yellow) and Yangzi (Chang) rivers. This interaction goes back to prehistoric eras; it enters the historical record during the Zhou dynasty and becomes a dominant theme during the four hundred years of the Han dynasty (206 BCE–220 CE). At that time the Xiongnu were the dominant nomadic contenders, and much of Han statecraft was taken up in efforts to bring these aggressive raiders under control. During the fourth and fifth centuries Turkic peoples ruled much of north China. During the Song dynasty (960–1279) their role was taken mainly by Khitans and Jurchen peoples from northeast Asia. Then the Mongol regime, which had taken over north China under the rule of Chinggis (Genghis) Khan (c. 1162–1227) and his immediate successors, seized control of the rest and installed its own Yuan dynasty (1279–1368) over all China. The Ming dynasty (1368–1644) was able to push

the Mongols back into Inner Asia but not to subdue them. In 1644 another northeast Asian regime, led by Manchus, seized control of north China, setting up the Qing dynasty (1644–1911/12). During the next forty years it suppressed all opposition, and in the mid-eighteenth century it brought the remaining Mongol regimes to heel.

Thus, for long periods foreigners have ruled China. Mongols also imposed regimes with much bloodshed in central and western Asia and for a brief period appeared poised to overrun eastern Europe. Later Central Asian empires, such as those created by Timur (reigned 1370–1405) and the Mughal dynasty founded by Babur (1483–1530), were offspring of the original Mongol regimes, testifying to the remarkable and sustained military and political power consolidated by Chinggis Khan and his successors. That is why the history of these regimes demands the attention of world historians. Although these regimes arose from a marginal, steppe-bound cultural base, within a generation or two they were able to produce sophisticated rulers, such as Khubilai Khan (1215–1294) and Akbar, who were open to new ideas and personalities. Thus, the Polo family members of Italy were able to travel between Venice and eastern Asia, Roman Catholics to set up churches in the Yuan capital of Beijing, and Chinese Nestorian Christians to travel to western Asia and as far as France.

During the Mongol era Islam began to take root in China. Islam had been moving into Central Asia from the eighth century CE on, replacing Buddhism and other religions. Compared with Buddhism, however, its access into China and eastern Asia has been limited. The Hui segment of Chinese practitioners of Islam live in northwest and southwest China and in small numbers elsewhere, and Turkic Muslims live in larger numbers in China's most westerly province of Xinjiang. But in China, Muslims have run up against resistance and conflict from the dominant Confucian Han people. During the mid-nineteenth century this resistance and conflict resulted in two huge Muslim rebellions in southwest and northwest China, both of which were brutally suppressed. Thus, Islam remains strongest on the margins of Chinese civilization. It

has had much greater success penetrating Southeast Asia and has become the dominant religious and cultural presence in Malaysia and Indonesia.

Although the rise of the West is generally traced (in the West) to the explorations sponsored by the Portuguese prince known as Henry the Navigator, and to those of the Italian explorer Christopher Columbus and the Portuguese navigator Vasco da Gama, the activities of these men were of no concern in the Asian world, where much vaster political and military forces were deployed. From an Asian perspective one cannot speak seriously of the rise of the West until the later eighteenth century, when the British East India Company made inroads into the political and economic control of Bengal in India. Not until the mid-nineteenth century did British and U.S. forces successfully challenge the governments in Beijing and Tokyo.

But from the mid-nineteenth century on all areas of Asia came under increasing pressure from Western countries. Britain established hegemony over India and to a certain extent over Iran. France took control in Southeast Asia and Holland in Indonesia. British power overflowed into Burma and the Straits Settlements (now Malaysia and Singapore). Britain, France, the United States, and later Germany all competed for power in China and were able through diplomacy and coercion to force the Chinese government to yield treaty ports, concessions, extraterritorial legal privileges, and spheres of influence. Meanwhile, during the late seventeenth century czarist Russia began its long drive into eastern and Central Asia. To the east it encroached on the hinterlands of the Manchu regime and managed through adroit diplomacy to carve off huge territories that are now part of Russia, including the vital seaport of Vladivostok. By the mid-nineteenth century Russia's encroachment into Central Asia began to rub up against the hinterlands of the British Raj in Tibet, Afghanistan, and Iran, precipitating what became known as the "Great Game" for control of the petty kingdoms and principalities throughout Central Asia. Because of czarist Russia's ability to deploy superior military forces this was a game that czarist Russia and its successor, the Soviet Union, were

destined to win. Indeed, not until the Soviet debacle in Afghanistan during the 1980s and the collapse of the Soviet Union shortly thereafter was Russian power in Central Asia significantly set back.

Rise and Fall

An understanding of the forces underlying the rise of Western imperialism and the decline of Asian sovereignty has long relied on two basic arguments. The first is the inherent superiority of Western values as expressed in democracy and market capitalism, a line of thinking originating with the Scottish economist Adam Smith and the French *philosophes* (deistic or materialistic writers and thinkers of the eighteenth-century French Enlightenment) and developed by the German sociologist Max Weber and others. The second is the Leninist argument that Western imperialism is an exploitative extension of bourgeois capitalism (manifested, for example, in the sale of opium) that would collapse with the achievement of worldwide socialist revolution. During most of the twentieth century these arguments battled for mastery. The collapse of Western colonialism during and after World War II, the retreat of the British from India, and the crowning success of the Chinese Communist revolution appeared to validate the Leninist case and put the West on the defensive. The postwar revival of the Western and Japanese economies, followed in due course by the collapse of the Soviet Union, China's near abandonment of its socialist economy during the 1980s and 1990s, and continuing political travails in Islamic countries appeared to do the reverse. Leninist arguments now carry little weight, and Western market capitalism and democracy seem to be in the ascendant.

But before Western pride goes too far, we should recall the deep roots of non-Western civilizations and consider how their values could influence global history in the future. Eastern civilizations are not inevitably at a disadvantage against the West, as the rapid rise of Japan during the late nineteenth and early twentieth centuries testifies. Today China is on the march. During the last twenty-five years China's

economy has been growing at an average annual rate of at least 7 percent. Large areas of urban China (a region of 400–500 million people and growing rapidly) have converted themselves into modern cities with new transportation and telecommunication infrastructures and massive new developments in industrial plants, office buildings, and high-rise housing. The Pearl River delta region is becoming the workshop of the world, just as Britain was during the later nineteenth century, and Walmart is one of its leading customers. India is about twenty years behind China, but developments in Bangalore indicate what could be achieved elsewhere during the next few decades. No one can hold down such deep-rooted cultures indefinitely. One hundred and fifty years of subordination to the West is a long time, but that time is now abating, at least for China and India, as it already has for South Korea, Taiwan, Hong Kong, and Singapore and as it did so forty years ago for Japan.

For other areas of Asia the future is less rosy. In Laos, Cambodia, Myanmar, Afghanistan, Tajikistan, Turkmenistan, Bangladesh, and Pakistan or in communities in Iraq, Palestine, and North Korea and in some rural areas of China, India, and Siberia, life is hard, and governments are too often corrupt and oppressive. Consider these data: The infant mortality rate in Afghanistan in 2009 was 151.95 deaths per 1,000 live births. In Laos it was 77.82 per 1,000, in Myanmar 72.11 per 1,000. However, in Japan it was 2.79 per 1,000. Literacy in Afghanistan was 28.1 percent, in Laos 68.7 percent, in Myanmar 81 percent, and in Japan 99 percent. In every case except the last, literacy of women is much lower. For Afghanistan the gross domestic product per person is calculated at \$800 per year; in Myanmar it is \$1,500. In Japan it is \$34,100. Figures such as these help to explain why Afghanistan and Myanmar (Burma) are now the world's leading producers of opium, and why warlords control their governments.

Does it have to be that way? Two thousand years ago Afghanistan flourished under great empires enriched by the Ghandaran culture that grew out of the invasions of Alexander the Great. Afghanistan was the site of one of the world's greatest Buddhist

Everyone has been made for some particular work, and the desire for that work has been put in every heart. • Rumi (1207–1273)

monuments at Bamiyan until the Taliban destroyed it in 2001. Silk Roads commerce at its height brought wealth and opportunity into Central Asia. Under Abbasid and Seljuk rule Samarkand in Uzbekistan became one of the world's richest and most cultured cities, the home of the brilliant eleventh-century poet and mathematician Omar Khayyam. Although devastated by Mongol invasion, the city rose to new heights as the capital of the Timurid Empire and became one of the architectural wonders of the world. Balkh in Afghanistan was the birthplace in 1207 of Rumi (Jalal ud-Din Rumi, a Sufi Muslim mystic) and one of the world's most inspired poets. No region is without its glories or follies, and Asia is a rich source for the study of civilization and its problems.

Asoka

(c. 292–232 BCE)

MAURYAN EMPEROR

After expanding the Mauryan Empire in third-century-BCE India, Asoka spread Buddhism and his principles of *dhamma* (dharma)—a philosophy that encouraged social responsibility, tolerance, and respect for all living things—throughout his empire. Through his rule, Asoka encouraged the proliferation of nonviolent practices, which also strengthened and unified the empire.

Asoka ruled the Mauryan Empire in ancient India from approximately 269 to 232 BCE. The empire was established around 321 BCE by Asoka's grandfather, Candragupta Maurya (d. c. 297 BCE), soon after the withdrawal of Alexander III of Macedon (Alexander the Great, 356–323 BCE) from northwestern India. With its capital at Pataliputra (modern Patna), it was an exceptionally vast, centralized, and long-lived empire. After Asoka's death, the Mauryan Empire went into decline, succumbing to the Sunga dynasty in 185 BCE.

Asoka is a towering figure in India's national historical narrative and in the annals of Indian and Sri Lankan Buddhism. He is remembered primarily for his renunciation of war and violence, his conversion from Hinduism to Buddhism, his patronage of Buddhism, and his conception of a novel philosophy of moral and righteous behavior (Pali: *dhamma*; Sanskrit: *dharma*).

After a struggle for the throne, Asoka succeeded his father, Bindusara (d. 272 BCE), in 269 BCE following a four-year interregnum. He had gained administrative experience governing the provinces of Taxila and Ujjain during Bindusara's reign. The art of administration was finely developed in the Mauryan empire,

as is clear from the *Arthashastra*, a treatise on statecraft by Kautilya, Candragupta Maurya's principal adviser and minister.

As king, Asoka extended the empire territorially. Around 260 BCE he conquered Kalinga (modern Orissa). The conquest had unusual consequences. In Asoka's words: "[T]he Beloved of the Gods [Asoka] felt remorse, for, when an independent country is conquered the slaughter, death and deportation of the people is extremely grievous to the Beloved of the Gods and weighs heavily on his mind" (Thapar 1997, 255). Following the Kalinga campaign, Asoka converted to Buddhism, advocated nonviolence, and came to believe in conquest through moral suasion rather than war. It is important to note, however, that he only renounced violence once empire building was complete and almost the entire Indian subcontinent, excluding friendly kingdoms in the south, was under Mauryan sway.

Under Asoka's auspices, Buddhism developed into a major religion. At the Third Buddhist Council (250 BCE), held at Pataliputra during Asoka's reign, it was decided that Buddhism would actively seek converts. Asoka built stupas (reliquary mounds) and monasteries and sent missions to neighboring countries like Ceylon (now Sri Lanka).

A paternalistic ruler who addressed his subjects as "my children," Asoka sought to instill in them his concept of *dhamma*. This was a humanistic philosophy based on social responsibility, tolerance, and respect for all living beings. It is possible that *dhamma* served the pragmatic function of providing a unifying ideology for an exceptionally diverse and multicultural empire. Special officers were appointed to ensure the practice of *dhamma* throughout the realm. Asoka

himself traveled extensively to keep abreast of happenings in his empire.

Edicts inscribed on pillars and rocks carried Asoka's word to the far reaches of his empire while he lived and left it to posterity after he died. The Asokan pillars that survive are stone monoliths, capped by animals like lions or bulls. (The capital of lions surmounting one such pillar, at Sarnath, is the national

symbol of contemporary India.) It is through his edicts that Asoka has emerged as a significant historical figure from the mists of time. In 1837 James Prinsep, a British epigraphist, deciphered a pillar inscription from Delhi that referred to a king "*Devanampiya* [beloved of the gods] *Piyadassi* [of gracious mien]." This was connected to pillar and rock inscriptions found over a large expanse of territory,

from modern Afghanistan in the northwest to Bengal in the east and Mysore in the south. A single provenance was established for the inscriptions and Asoka, renowned in Ceylonese Buddhist chronicles, was identified as their author.

The edicts were written in the vernacular (mostly Prakrit but also Greek and Aramaic in the northwest). A few inscriptions were declarations of Asoka, as a lay Buddhist, to the Buddhist religious community. Most were public proclamations instructing people in the way of *dhamma* or detailing Asoka's good works, such as the construction of hospitals and roads and the planting of shade trees.

Asoka, in the tradition of his father and grandfather, had diplomatic contacts with foreign kingdoms such as Syria, Egypt, Cyrene, Epirus, and Macedonia to the west of India and Ceylon and southern Indian kingdoms to the south. He sent missions abroad to popularize his concept of *dhamma*.

Historians have shown that accounts of Asoka's idealism need to be tempered with recognition of his pragmatism. His abjuring of violence was

opportune, and his concept of *dhamma*, as mentioned earlier, may well have been designed to unify the diverse peoples of his empire. Nonetheless, Asoka's name is remembered in world history for his promulgation of Buddhism and his endorsement of nonviolence.

Assyrian Empire

The Assyrian Empire was the first to bring together the various cultures of the Near East into a single political entity. Governing the area presently known as the Middle East, the Assyrian Empire was at its peak for about three hundred years (from the ninth to sixth centuries BCE), and its impact still presents itself in modern life through mediums such as art and biblical references.

During its heyday, between about 900 and 600 BCE, the Assyrian Empire was arguably the largest and most complex political formation the world had yet seen. After its initial stage of expansion during the ninth century BCE, Assyria came to dominate the entire region that we today call the Middle East: from the Zagros Mountains in modern Iran to the eastern coast of the Mediterranean, and from the Taurus mountains in southern Turkey to the Persian Gulf. Through their imperial policies, the Assyrians became a driving force in shaping the political, cultural, and demographic makeup of the ancient Near East, setting the stage upon which much of the drama of the Old Testament was played out, and helping to preserve and transmit much of the tradition of Mesopotamian civilization to the Persian and Mediterranean worlds. In so doing, the Assyrians left an indelible mark on the development of civilization within and beyond the Middle East.

Origins and Background

The origin of Assyria is closely related to the fortunes and misfortunes of the city of Ashur (modern Qalat Sharqat in Iraq), whence Assyria gets its name. For

much of the latter half of the third millennium BCE, Ashur had been home to a northern outpost of the Sumero-Akkadian civilization emanating from the alluvial plains of southern Iraq. However, during the upheaval that marked the end of the third millennium, the site was abandoned. Assyrian historiography recorded in the Assyrian King List, which describes the earliest Assyrian kings as kings “who lived in tents,” has led many scholars to the conclusion that at the beginning of the second millennium, nomadic Assyrians used the abandoned mound of Ashur as a seasonal camp, regularly performing religious rituals there. The site eventually became home to a permanent temple to Assyria’s chief god (also called Ashur) leading to the settlement of what had been several dispersed nomadic groups on the already ancient mound surrounding the temple. The early political development of the Assyrian state was influenced by two factors: the structure of the Sumerian and Akkadian city-states of alluvial southern Iraq, and the tribal traditions of the early Assyrian nomads.

The position of Ashur, on the Tigris River some one hundred kilometers south of Mosul in northern Iraq, has distinct advantages and disadvantages. The fact that the site lies almost directly on the line below which rain-fed agriculture was not feasible in most years meant, first, that the city never had a reliable agricultural hinterland, and, second, that the Assyrian capital was located far from the important metal and lumber source areas of western Iran and southeastern Turkey. Thus, from the very beginning, the Assyrians were forced to look beyond their local environs for the resources and manpower necessary for state building. The advantage of the location of Ashur lies in the fact

The Assyrian Empire and the region of the eastern Mediterranean, 750–625 BCE. *The Historical Atlas*, William R. Shepherd, 1923.

that it was at the intersection of several important east-west and north-south trade routes linking highland Iran and the Persian Gulf with eastern Anatolia and the Mediterranean.

The circumstances imposed by the location and environmental setting of the city of Ashur also influenced the development of the Assyrian state. The first segment of Assyrian history that comes into focus in the textual record is that of a commercial empire established by Assyrian merchants during the Old Assyrian period (c. 1900–1750 BCE). Although the Assyrians did not control territories beyond the general vicinity of the city of Ashur at this time, they established a vast trading network with outposts as far away as central Anatolia. Assyria first emerged as a territorial state under the Amorite king Shamshi-Adad I (reigned c. 1830–1776 BCE). Shamshi-Adad and his sons progressively extended Assyrian control until they could claim dominion over most of upper

Mesopotamia (what is today Syria and northern Iraq). However, the Old Assyrian state was short-lived. Soon after the death of Shamshi-Adad, most of Assyria's former holdings were overrun by Hammurabi of Babylon (reigned c. 1792–1750 BCE). Through much of the succeeding period Assyria lived in the shadow of Kassite Babylonia and the Hurrian Empire of Mitanni. Assyria did not play a significant role on the international stage again until the reign of Ashur-uballit I (c. 1366–1330 BCE), and over the next 150 years the Middle Assyrian state again came to dominate the political scene in upper Mesopotamia.

The beginnings of an imperial political structure first appeared in Assyria during this middle period. The Middle Assyrian state combined the traditions of monarchy established by Shamshi-Adad during the Old Assyrian period with the administrative structures of the Babylonians and Mitanni to create a complex political and administrative apparatus capable

Sculptures of winged bulls, often found at the entrances to Assyrian temples, symbolize the fusing of mental and physical power.

of maintaining a new level of political authority over vast areas of the ancient Near East. But the balance of power among the great kings of the Late Bronze Age (c. 1500–1100 BCE) began to crumble at the end of the thirteenth century BCE, leading to a period of collapse and mass migration that profoundly changed the political and demographic makeup of the region. From the rubble of the Late Bronze Age rose the Neo-Assyrian Empire.

The Neo-Assyrian Empire

Neo-Assyrian imperialism built upon and surpassed the achievements of the Middle Assyrian state. The political centralization, imperial ideology, and militaristic tendencies of the Middle Assyrian state were all carried over, in one form or another, to the Neo-Assyrian system, but the scale and efficiency of the Neo-Assyrian Empire was, in its time, unprecedented in world history. Assyria's new rise to prominence was the result of a complex and interrelated set of political, economic, and social factors that are difficult to sort out. The turbulent history of the region, as well as the reemergence of Babylonian and Hurrian states and the constant threat posed by the Arameans, made increased militarism a prerequisite for Assyrian survival. Inefficient farming techniques and the shortage of labor were constant problems in the Assyrian heartland. These factors, combined with the disruption of the trade routes established in the Old Assyrian period and the political instability of resource areas, undoubtedly made imperial expansion and political control an attractive solution to declining revenues.

Whatever the factors that caused Assyria to make the transition from state to empire, the final outcome was impressive, for Assyria was the first state to unite the diverse cultures of the ancient Near East into a single political unit.

Ashur-dan II (r. 934–912 BCE) was the first Neo-Assyrian king to conduct regular military campaigns after the turn of the millennium, and his reign is therefore considered by many to mark the beginning of the Neo-Assyrian Empire. This king spent most of his energy attempting to reassert Assyrian sovereignty over territories formerly controlled by the Middle Assyrian monarchs, and in so doing he laid the foundation for the ambitious campaigns of his best-known successors, Ashurnasirpal II (r. 883–859 BCE) and Shalmaneser III (r. 858–824 BCE).

During the reign of Ashurnasirpal, Assyrian expansionism began to take on a truly imperial character. Assyrian royal ideology required Assyrian monarchs to show their strength by setting out on regular military campaigns. However, prior to the reign of Ashurnasirpal, most Assyrian military campaigns had been little more than organized raids on neighboring lands. Ashurnasirpal II altered this tradition through the consolidation of military gains in the newly established provinces. This consolidation included the construction of provincial capitals and outposts, the establishment of a system of vassal state alliances, and the deportation and resettlement of vanquished peoples in newly conquered lands. Ashurnasirpal was also the first of a series of Neo-Assyrian kings either to relocate the imperial capital (from Ashur to Kalhu, then to Dur-Sharruken, and finally to Nineveh) or to construct a new royal palace in the existing capital to act as a new military and administrative center of the empire.

The strict organization of the Assyrian provincial system was probably undertaken during the reign of Tiglath-pileser III (r. 744–727 BCE). Tiglath-pileser, who himself had been a provincial governor and was a usurper to the throne, knew full well the dangers of allowing provincial administrators too much independence. As part of his effort to tighten the reigns on Assyria's vast holdings, Tiglath-pileser III

A drawing of a religious leader and warriors copied from a fragment painted on an Assyrian tile.

probably reorganized governmental hierarchies and established a system in which officials responsible directly to the king monitored the activities of provincial governments. Assyria's system of deportation and resettlement also reached its peak during the reign of Tiglath-pileser III, when ancient documents record tens of thousands of people being moved to and from nearly all the imperial frontiers.

The crown jewel of Assyrian military expansion came when Esarhaddon (r. 680–669 BCE) conquered the Nile Delta and Egypt's original capital, Memphis. Egypt proved to be a difficult prize, however, that the Assyrians could not hold. Esarhaddon died during his second attempt to conquer Egypt, and it was up to his son Ashurbanipal (r. 668–635 BCE) to finish the job. By this point, however, considerable wrinkles had formed in Assyria's imperial plans. To begin with, premodern transportation technology made governing the far-flung provinces extremely costly, while considerable effort was spent in the attempt to subjugate Egypt. In addition to this, a civil war broke out between Ashurbanipal and his half-Babylonian brother, who had been installed as king of Babylon by Esarhaddon.

Very few details of the last years of the Assyrian Empire are preserved in the historical record. Although fall of the empire has often been referred to as a “collapse,” the momentous events marking the end of the empire were not the work of an external rival group: it was the Babylonians, along with their Median and other allies, who eventually destroyed the cities of the Assyrian heartland, including the capital at Nineveh, which fell in 612 BCE. Thus the empire was destroyed from the inside, with one of the most important groups in the ethnic mix of the empire, the Babylonians, inheriting Assyria's holdings largely intact.

Assyria's Legacy

The Assyrian empire is well known from references in the Bible. Perhaps the most famous of these is to the Assyrian king Sennacherib (r. 704–681 BCE), who attacked Judah and besieged Jerusalem during the reign of Hezekiah in 701 BCE. Indeed, the Assyrian threat to the relatively insignificant state in Judah was the context in which several chapters of the Old Testament

are set (Kings and Isaiah, for example); the Assyrians had a significant impact both on the world of the Old Testament and on later views of that time.

The image of Assyria as a great imperial power also reaches the modern world through art. Excavations that took place in northern Iraq during the mid-to-late nineteenth century not only awakened the general public to the archaeological reality behind the Biblical stories, but filled the museums of Europe with countless Assyrian treasures. Perhaps the most famous of these Assyrian artifacts are the carved stone wall panels that once adorned the Assyrian palaces.

Several studies that have attempted to reassemble the now-dispersed stone panels argue that Assyrian art and architecture served as an integrated system for the transmission of Assyrian ideology and culture. However, the historical significance of the Neo-Assyrian Empire lies neither in modern perceptions of the empire, nor in the influence the Assyrians imposed on the creation of the early Judeo-Christian world. Rather, Assyria's importance lies in the fact that the Assyrian state that emerged during the Mesopotamian Iron Age represented an entirely new level of political development. The Assyrians were

Imperialism is based upon a persistent misrepresentation of facts and forces chiefly through a most refined process of selection, exaggeration, and attenuation, directed by interested cliques and persons so as to distort the face of history. • **J. A. Hobson (1858–1940)**

the first true empire builders, and it was upon their legacy that later empires, such the Persian, Greek, and Roman, were modeled.

Augustine, Saint

(354–430 CE)

EARLY CHRISTIAN THEOLOGIAN

Best known for his *Confessions* and *City of God*, the theologian Augustine of Hippo wrote numerous works after his conversion to Christianity in 386. His profound and lasting influence on Western Christianity and philosophy led to his canonization by popular acclaim, rather than by papal edict.

Augustine of Hippo (354–430 CE) was the dominant Christian theologian between Christian antiquity and the high Middle Ages. A prolific writer, he authored ninety-three books, hundreds of letters, and thousands of sermons. He was born in Tagaste (today Souk-Ahras, Algeria) in the Roman province of Numidia. Patricius, his father, belonged to the middle class and was a pagan. Monica, his mother, was a devout Christian who had him enrolled as a catechumen at an early age.

Augustine received his elementary and secondary education in Latin and Greek in Tagaste and Madaura. For higher studies, he was sent to Carthago, the half-pagan metropolis of Numidia. Here he formed a liaison with a woman (name unknown) with whom he lived for fifteen years and who bore him a son, Adeodatus.

Hitherto dissolute, Augustine came to a turning point about 373, when he was inspired by a reading of Cicero's *Hortensius* to seek "wisdom." Attracted by the cosmology and moral teachings of Manichaeism, he became a convert to that dualistic Gnostic religion. Nine years later, having become convinced that it lacked rationality, he abandoned it. In 384, after about ten years of teaching rhetoric in Tagaste, Carthago, and Rome, Augustine secured

an appointment as professor of rhetoric and court orator in Milan, then the capital of the Western Roman Empire. Now a widow, Monica followed him to Milan and, concerned for his spiritual and economic welfare, arranged for his engagement to a Christian heiress. Augustine dismissed his concubine but retained their son. In his *Confessions* Augustine was to recall that separation from his mistress caused him excruciating pain.

As an imperial representative, Augustine met Ambrose, the scholarly bishop of Milan, whose sermons persuaded him that it was possible to be both a Christian and an intellectual. However, a close friendship with Ambrose did not develop, and Christian Neoplatonists in Milan were more influential in bringing Augustine to an acceptance of Christianity. In July 386, according to the dramatic account in the *Confessions*, Augustine surrendered to Christ. Resigning his professorship, and terminating his engagement with the Milanese heiress, he was baptized by Ambrose on Easter Sunday in 387. A new life dawned for Augustine, and he determined to return to Africa to establish a monastery. On their way back to Africa, Monica died and was buried in Ostia, Italy. In his *Confessions*, Augustine paid a very loving tribute to his mother.

Although Augustine loved and respected the two principal women in his life, his mother and his concubine, his writings were to reinforce early Christian antifeminism. Augustine wrote that only men were made in the true image of God; women were in the image of God only insofar as they were wives, engaged in procreation. Women were symbols of carnality, although they too with God's grace could attain salvation.

Sandro Botticelli, *St. Augustine in His Cell* (c. 1480). Fresco. Augustine of Hippo meditates under the Vespucci family coat of arms.

Augustine's fame as a preacher and theologian developed after his return to Africa. In 391, while on a visit to the port city of Hippo (or Hippo Regius; today Annaba, Algeria), he had the priesthood virtually thrust upon him by the local congregation. In 396 he became sole bishop (he had been co-bishop with Valerius) and remained such until his death.

As custom then dictated, he was both chief ecclesiastical officer and civil magistrate. Indefatigable, he found time to lead a semimonastic life, attend religious conferences, and write numerous theological tracts. Original sin, grace, predestination, freedom of the will, Scripture, heresy, philosophy, history, and

sexuality were among the diverse topics that engaged his attention.

Two works became classics: the *Confessions* and *City of God*. Written in 397, the *Confessions* conveyed profound psychological and spiritual insight. Though relating some details of his childhood and adulthood, Augustine's intention was to glorify God, express repentance for his sins, and encourage others to seek God. The *City of God*, written between 414 and 427, was prompted by a shattering event, the sack of Rome in 410. In the first part of this work, Augustine set out to show that the disaster was not caused by desertion of pagan temples for Christian altars, as some Romans maintained, but by inner rot. In the second part, Augustine elucidated a philosophy of history that was linear, not cyclical. He argued that the result of the sin of Adam and Eve was the creation of two cities, two societies, the City of Man (the earthly city) and the City of God (the heavenly city). The two were not separate but intertwined, to be separated only at the Last Judgment.

In the early church Augustine was best known for combating heresy. His first fifteen years as bishop of Hippo were dominated by controversy with Donatism, a puritanical branch of Christianity that had a strong presence in Africa. In contrast with Donatist views, Augustine maintained that apostates who repented did not require rebaptism, and that the sacraments had a validity of their own, regardless of the state of grace of their administrators. After the issuance of an imperial edict, Augustine, who had sought a meeting ground with Donatist bishops, reluctantly acquiesced in the use of force against the Donatist churches. The concept of religious freedom was unknown at that time.

Other teachings that Augustine struggled against were Manichaeism, which he knew from personal experience, and Pelagianism. A recent arrival into Africa, Pelagianism denied that original sin had totally vitiated human nature. In opposition to this thesis, Augustine contended that the sin of Adam and Eve, passed on to all of posterity, had alienated human

Faith is to believe what you do not see; the reward of this faith is to see what you believe. • **Saint Augustine (354–430 CE)**

persons from God and therefore reconciliation could be achieved only by baptism.

Augustine died 28 August 430 during the Vandal siege of Hippo. A cult of Augustine spread quickly in Europe, and his canonization was not the result of any papal procedure (none existed at the time) but of popular acclaim. In 1295 Pope Boniface VIII proclaimed Augustine a doctor of the church.

Augustine's influence on western Christianity was unparalleled until Thomas Aquinas appeared in the thirteenth century. Augustinianism with its Platonic overtones gave way to Scholasticism with its Aristotelian underpinnings. During the Reformation era, Luther and Calvin revived Augustinian ideas regarding predestination. In more modern times Augustine's influence may be found in the works of Blaise Pascal, Jacques Maritain, and Joseph Ratzinger (elected as Pope Benedict XVI in 2005), among others, as well as in some of the documents of Vatican II. Though a man of his time in most matters, Augustine as a

theologian and philosopher showed independence and originality.

Aurangzeb

(1618–1707)

RULER OF MUGHAL INDIA

Aurangzeb's aggressive policies expanded Mughal territory in seventeenth-century India to its zenith but sowed the seeds for the empire's eventual dissolution. The exhaustive military campaigns, hefty taxes, aggressive defense of imperial policy, and heavy-handed patronage of Islam that characterized Aurangzeb's rule divided and weakened the empire over the course of his forty-nine-year reign.

Muhi-ud-Din Muhammad Aurangzeb 'Alamgir was the last of the great Mughal emperors, rulers of much of present-day South Asia from 1526. Although Aurangzeb displayed military talent, administrative acumen, and political tenacity over the course of a forty-nine-year-long reign (1658–1707), his legacy was an ambiguous one. While Aurangzeb succeeded in pushing the Mughal Empire's frontiers to their furthest limits, the ceaseless warfare that this entailed exhausted the empire and degraded its administrative machinery. Aurangzeb's attempts to refashion an inclusive Mughal political ideology and culture along Islamic lines also opened political and religious fissures within the Mughal polity that his successors were unable to surmount.

Aurangzeb's early military success led his father (crowned as Emperor Shah Jahan in 1628) to appoint him governor of the Deccan, in the center of the subcontinent, in 1636. After serving in that capacity until 1644, Aurangzeb served as governor of Gujarat (1645–1647) in the west, Multan (1648–1652) in present-day Pakistan, and, for a second time, the Deccan (1652–1658). He also commanded imperial expeditions against Balkh (1646) and Kandahar (1649 and 1652) in what is now Afghanistan.

Cumulatively, these assignments allowed Aurangzeb to build a reputation as a skillful general and an energetic administrator.

Aurangzeb's eldest brother and primary political competitor, Dara Shikoh, viewed his rising fortunes with particular alarm. By the mid-1650s the imperial family had effectively fractured; whereas Aurangzeb's other brothers—Shuja and Murad Bakhsh—allied themselves with Aurangzeb, Shah Jahan sided with Dara Shikoh. Tensions finally culminated in a bitter fratricidal conflict when Shah Jahan was taken ill in the fall of 1657. Over the next year, Aurangzeb emerged as the new Mughal emperor, overcoming military challenges by all his brothers and dethroning his father (who died under house arrest in 1666).

From the onset of his reign, Aurangzeb set the Mughal Empire on an aggressively expansionist course. In addition to campaigns against Bijapur (1660–1661, 1665–1666) in the west, Mughal armies moved against Palamau in Bihar (1661), Cooch Behar and Assam (1661–1663) in the northeast, and Arakan, presently divided between Bangladesh and Myanmar (1664). In subsequent decades Aurangzeb conquered the Deccan sultanates of Bijapur (1686) and Golkonda (1687) and extended Mughal authority over most of southern India. Aurangzeb's military record nevertheless was a mixed one. Besides, no lasting gains in Assam the Mughals were unable to crush the military challenge posed either by the Maratha rebel Sivaji (d. 1680) or his successors in the Deccan, even though Aurangzeb took personal charge of field operations after 1681 and succeeded in capturing and executing Sivaji's son and successor, Sambhaji, in 1689. Ultimately, decades of continuous warfare against the Marathas stymied the

Unknown Mughal court artist, *Emperor Aurangzeb*. Opaque watercolor and gold. Ackland Art Museum.

consolidation of imperial control over the south, led to plummeting morale within Mughal ranks, and corroded the longstanding aura of Mughal military invincibility.

Aurangzeb's lifelong interest in military affairs was matched by attempts during the initial decades of his reign to improve the Mughal administrative machinery. This was especially true with regard to the collection of land revenue taxes, the cornerstone of Mughal finances. Intensifying imperial pressure on local landholders, however, catalyzed a series of anti-Mughal revolts among various groups from 1669 through 1697. By the 1690s, Aurangzeb's preoccupation with the war in the Deccan and increasing political instability resulted in weakening imperial

oversight with severe long-term implications for the financial viability of the empire.

After he became emperor, Aurangzeb zealously—and often shortsightedly—defended his own imperial prerogatives. Two examples stand out. First, Aurangzeb willingly triggered a massive rebellion among the Rajputs between 1679 and 1681, in order to protect his right to place a candidate of his choosing on the throne of Marwar (Jodhpur). Aurangzeb's actions are significant because they permanently alienated many Rajputs, who had previously ranked among the Mughal dynasty's strongest supporters. Second, all of Aurangzeb's five sons suffered the ignominy of severe reprimands, incarceration, or permanent exile after dissenting against various imperial policies. After the late 1680s, Aurangzeb also bypassed his sons in favor of a coterie of noble loyalists. In so doing, Aurangzeb ended up fatally undermining the authority of his imperial successors.

Ultimately, however, Aurangzeb is best known for his attempts to conform imperial policies to a narrow interpretation of Islamic scriptures while simultaneously pursuing actions that favored his Muslim subjects. Aurangzeb's more controversial gestures included empowering public censors to enforce Islamic injunctions on morality (1659), imposing double customs duties on non-Muslim traders (1665), ending imperial patronage of music and the arts (1660s), reimposing the *jizya* (a poll tax on non-Muslims, 1679), and making imperial land grants to Muslim clerics transferable and hereditary (1690) while denying Hindu religious figures access to those grants. Aurangzeb's actions seem to have been informed by a combination of personal zeal and political calculation that demanded shoring up his support among various powerful Muslim constituencies. Aurangzeb's initiatives marked a critical—if occasionally only symbolic—departure from the religiously inclusive and tolerant policies followed by Mughal emperors over the previous century.

Aurangzeb died of old age in February 1707. A bitter war of succession between his three surviving sons followed. Mu'azzam (crowned as Bahadur

Shah) emerged victorious and immediately set about reversing many of his father's policies.

Australia

Aboriginal peoples from Southeast Asia came to Australia at least forty thousand years ago. They (and the continent) remained isolated from the rest of the world until trade developed, first with islanders to the north, then, in the seventeenth century, with Europeans extending their empires. Today Australia is a culturally diversity nation-state with strong ties to the West and ever-more challenging relationships with Asia.

Australia is a sovereign nation in the Southwest Pacific, occupying a continent of nearly 7.7 million square kilometers; it is the only continent coterminous with a single nation state, and has for the majority of world history been the most isolated continent save for Antarctica. Its flora (predominantly sclerophyll [eucalyptus] forest and acacia and mallee scrubland), and its fauna (predominantly marsupials that carry and suckle their young in pouches but including monotremes, or egg-laying mammals) are distinctive. Apart from Antarctica, it is the world's most arid continent, with large areas of semi-desert. It is profoundly influenced by the climate cycle known as El Niño / La Niña, with long droughts punctuated by seasons of heavier rainfall in the south and monsoon conditions in the north.

Originally part of the ancient supercontinent of Gondwanaland that encompassed South America and Antarctica, the land mass of Australia existed for many millions of years in total isolation until the arrival of aboriginal people from Southeast Asia at least forty (and perhaps as long as sixty) thousand years ago. Aboriginal Australians evolved a close relationship with their physical environment, but transformed it aided by the introduction of the dingo (a

semi-domesticated canine species), about 3,500 to 5,000 years ago. Aboriginal people were overwhelmingly hunter-gathers who altered the composition of the forests through selective burning of vegetation. This “fire stick farming” made large sections of forest more open and suitable for the hunting of marsupials. Before human settlement, megafauna in the form of giant thylacine (Tasmanian tiger), kangaroo, and wombat-like species roamed, but were rendered extinct by a combination of aboriginal impacts and climate change. Aboriginal people gradually occupied the entire continent over thousands of years.

European Occupation

The isolation of this continent and its peoples was further breached in the centuries before European occupation. From at least 1720 and perhaps as much as three hundred years earlier, trade developed between aboriginal Australians and the islanders of present day Indonesia and New Guinea to the north; from these sources may have come rat and cat populations before Europeans arrived. The first European arrivals were the Spanish and then Dutch sailors of the early-to mid-seventeenth century in quest of trade and empire on behalf of their respective monarchs. The Dutch explorer Abel Janszoon Tasman “discovered” (in European terms) New Zealand and present day Tasmania (he called the latter Van Diemen's Land), while the English sailor William Dampier explored the northwest coast of Western Australia in the 1688 and 1699; but it was not until 1770 that Captain James Cook discovered and claimed the eastern half of the Australian continent for Britain while on a trip of naval exploration in the Pacific.

Gustav Mützel, *Australian Fauna* (1880). The thylacine (Tasmanian tiger, the dog-like animal on the left) is now believed to be extinct, while marsupials that carry and suckle their young in pouches are predominant. New York Public Library.

Faced with the ever-growing numbers of prisoners produced by a draconian criminal code, the British government decided in 1786 to establish, on Cook's recommendation of the suitability of the site, a penal colony near present day Sydney. On 26 January 1788, Captain Arthur Phillip and over one thousand prisoners (whose hefty jail terms were often commuted from death sentences) established the first European settlement in New South Wales. The fledgling colony existed initially on a mixture of subsistence crops, but quickly developed coastal sealing and timber getting. The area was visited by the whalers of several European countries and of the newly formed United States. French explorers engaged in scientific research during the Revolutionary and Napoleonic era indicated that the political hold of the British was at first tenuous. But the defeat of the French in the Napoleonic Wars removed that threat by 1815. Thereafter the expansion of Australia was underwritten by British naval supremacy until World War II.

Initially hemmed in by its difficult terrain and dense coastal forest, Europeans expanded settlement into

the formidable barrier of the Blue Mountains in 1813. Thereafter the rich grazing and farming lands to the west of the Great Dividing Range were opened up. In 1802 and 1803, additional colonies were established in Van Diemen's Land, where recalcitrant prisoners were sent, and in 1836, free settlers from that island pioneered a colony on the continent's southern shores that became Victoria. In 1829, another colony on the Swan River began the white settlement of Western Australia; and in 1836 a free colony in South Australia joined the list.

Entering the World Economy

Australian history was always tied up with foreign markets for primary products, and with the vicissitudes of the evolving world economy of capitalism. By the 1820s New South Wales had developed what was to be the future nation's first great economic staple, the merino wool industry, using sheep brought from Spain. Merino sheep were well adapted to the arid Australian environment, and their wool withstood

the long ocean journey to European woolen goods factories. On the basis of wool, Australia became extremely wealthy on a per capita basis by the mid-nineteenth century. White settlers seized the land for the sheep industry from aboriginal people under the doctrine of *terra nullius*, or “empty land,” a doctrine that recognized no legal authority on the part of the indigenous. The British government simply claimed sovereignty, but settlers had to establish their tenure against resistant aboriginal people. Disease and the guns of whites, however, gradually reduced this obstacle to European exertion of control.

Though profitable, wool required large landholdings and relatively few laborers as shepherds. Increasingly, pastoralists controlled vast estates. Until the transportation of British prisoners to the eastern Australian colonies ceased in 1850, these large pastoralist landowners, called “squatters,” used convict labor. By the 1840s, bitter battles had broken out between the governors and the pastoralists over the acquisition of and payment for land. Already an agitation on behalf of the growing numbers of free settlers sought the end to convictism, but the social landscape was even further transformed by the discovery of gold in Victoria in 1851. Many tens of thousands of European and American prospectors, and Chinese laborers rushed to the gold fields; Melbourne soon became Australia’s largest city, servicing the fields, and other gold rushes developed in Queensland and Western Australia later in the century. Gold brought intensified calls for democracy and moves toward self-government status, achieved in the middle of the 1850s for New South Wales and Victoria. The other colonies quickly followed suit.

Cities such as Melbourne, Brisbane (in the new colony of Queensland in Northeastern Australia, achieving self-government in 1859), and Sydney became entrepôts (intermediate centers of trade) for the export of the land’s products, which now included not only wool but also wheat and minerals. Australia quickly developed by the late nineteenth century as one of the most urbanized societies in the world; yet much of the wealth still derived from the land; painters, poets, and novelists exhibited a fascination for

“the bush” as shaping a distinctive, egalitarian, and masculinist national identity.

Australia remained throughout the nineteenth century subject to the demand pressures coming from European industrialization. The improvement of transport with faster sail ships and steamships tied the colonies ever more closely to the world economy and to Europe. Meat exports grew in the 1880s with the development of refrigeration; by 1900, the cattle industry spread across northern Australia, the nation’s last frontier. Cattle, wool, and wheat brought prosperity in the 1860s to 1890; wages were relatively high; free immigrants mainly from Britain (including Ireland) continued to enter, and society developed a racially “white” population that was said, with only a little exaggeration, to be 98 percent British. A strong middle class emerged in the cities committed to social and moral reform, but Australia was badly affected by the severe depression in the European world in the 1890s.

Class and Race, Politics and Governance

Partly as a result of that economic downturn, Australia entered a period of harsh class conflict between capital and labor; bitter strikes ensued, but the nation was not affected to any degree by Europe’s revolutionary socialism. After the labor movement’s defeat in these industrial wars, attention turned to the formation of a social democratic style of political party tied to trade unions, the Labor Party, that produced the first (but short-lived) Labor government in the world—in 1899 in Queensland. The nation was also affected by fears of racial takeover; the Chinese who had come with the gold rushes as laborers and miners posed one threat that colonists had railed against; Asian people became subject to restrictive immigration laws in the major colonies in the 1880s. The rise of Japanese power, particularly after the defeat of Russia in the Russo-Japanese war of 1904 was another development raising a threat of a “yellow peril.” This fear of external threats and the desire to overcome tensions within the class-divided society

Kata Tjuta, Ayers Rock region, Northern Territory of Australia. Photo by Kevin Connors (www.morguefile.com).

brought impetus to the movement for federation and a rising nationalism.

The political landscape was changed by the federation of the different colonies in 1901 as the Commonwealth of Australia, comprised of six states with a written constitution partly based on the American, but without a Bill of Rights and retaining the Westminster system of parliamentary government and allegiance to the Crown. The federal union was cemented by the incorporation of labor into a social settlement via a system of industrial arbitration to maintain high wages. As part of the implicit compromise non-white labor was to be excluded to placate white workers (South Sea islanders working contract labor under near-slave conditions on northern sugar plantations were sent home as a result); and women were granted federally the right to vote, one of the earliest achievements of this reform in the world. Along with New Zealand, Australia became known as a site of significant social democratic reform. The Labor Party exerted a strong influence and provided several of the early governments of the Commonwealth and states.

These social achievements and economic progress were shattered by external events of world history again—this time in the form of World War I from 1914 to 1918. Though Australia was self-governing in regard to internal affairs, it was part of the British Empire and its leaders took the nation into war against Germany alongside the mother country. Nearly sixty thousand Australian soldiers died in the conflict that followed. The war exacerbated class, religious, and other social tensions as many Australians of Irish-Catholic descent opposed the attempted introduction of military conscription. The ruling Labor Party split over the issue, and the nation entered a period of conservative rule that lasted almost unbroken until 1941.

Meanwhile, the 1920s and 1930s saw Australia in increasingly difficult economic circumstances due to the further impact of external forces of the world economy. Agricultural prices dropped worldwide in the 1920s, and the Great Depression of the 1930s hit Australia as hard as it did Germany and the United States. Australia sought and received imperial preference tariffs that tied the nation even closer to the

Sydney Opera House. Australia quickly developed by the late nineteenth century as one of the most urbanized societies in the world.

British. The growing threat of the Japanese did likewise. Australia relied on the British navy to repel this threat. But the fall of Singapore to the Japanese in World War II forced Australia to look to the United States after a call from the new Labor government. Hundreds of thousands of American troops passed through Australia, and the two nations fought to repel the Japanese. After the Allied victory in World War II, Australia formed a close political and strategic alliance with the United States, and sided with the Americans in the emerging Cold War. It also fought alongside the United States in the hot war that erupted in Korea (1950–1953), the Vietnam War of the 1960s, and in subsequent conflicts in Iraq (1991 and 2003–2009), and Afghanistan (beginning in 2001 and still involved as of 2010).

Internally, postwar Australia prospered once more as a result of the Cold War that raised the demand for Australian primary products, particularly wool. The nation's terms of trade were very favorable and the high standard of living underpinned twenty-three years of continuous conservative political rule under the Liberal Party after 1949. The social composition of the nation was changed dramatically.

Postwar refugees were welcomed in Australia from Europe, and to supply the labor needed for the nation's expanding factories and mines, workers from Italy, Greece, and other European countries entered in large numbers. As a result the nation became ethnically mixed. Gone was the country largely Anglo-Celtic and composed of the earlier British and Irish immigrants and native-born stock. The ties to the motherland were further undermined by Britain's entry to the European Common Market in 1964, a move that destroyed the old Imperial and Commonwealth trade preference system. Australia now had to find new markets, particularly in Asia, and the old enemy Japan in the 1960s and 1970s became the nation's greatest trading partner. Later in the 1990s and after, China loomed larger as an importer of Australia's mineral wealth. The drift towards Asia continued after 2000 and was reinforced by growing Asian migration.

Not until the 1960s had the White Australia policy, in operation since 1901, been challenged. At first came the admission of Asian students, then a cultural and social revolution from 1970 to 2000, as wave after wave of Asian immigrants from Taiwan,

The strongest initiative that government can take to ensure Australia is prepared for population ageing is to maintain a strong economy, and a secure nation. • **Julie Bishop (b. 1956)**

Hong Kong, Malaysia and other places entered; refugees from Vietnam in the 1970s, Lebanon in the 1980s, and from Africa and the Middle East after 2000 added to the interracial mixture. By 2001, 22 percent of Australians were foreign born. As a result of changing immigration patterns, Islam and Buddhism joined Catholic and Protestant Christian denominations as part of the multicultural mix. Though multiculturalism was widely accepted in the 1980s, the stream of non-white and Muslim immigrants began to produce an anti-multicultural backlash that conservative politicians exploited. A different though complementary problem arose from the nation's dependence on China for energy exports vital to the economy. This complicated fractious debates over climate change. Through its massive supply of coal and gas to Asian industrial powerhouses, Australia's history since 2000 has become increasingly tied to global concerns about carbon dioxide emissions. A third divisive issue was Aboriginal Reconciliation. Aboriginal people received limited but significant legal victories in the early 1990s over lost land rights, and a formal apology for past wrongs committed by earlier generations came from the new Labor government in 2008. Yet the demand for further "reconciliation" and financial compensation for two centuries of discrimination continued to be controversial.

In the year 2010, with a population of about 22 million, Australia stood poised between its European heritage and American alliance on the one hand, and links to Asia on the other. As at every other point, the destiny of Australia was profoundly shaped by the

patterns of trade, economic development, migration, and war that comprised world history.

Until recently, it was commonly believed that Aboriginal Australia changed very little from 40,000 years ago until the arrival of the Europeans—that the society remained in stasis with the natural world. The current view, however, is that Aboriginal peoples changed with the natural environment while they exerted control over it.

Aboriginal Australia has been viewed traditionally as a classic example of hunter-gatherer, that is, pre-agricultural, society—a continent of people in equilibrium with the natural environment. More recent perspectives, however, by anthropologists, archaeologists, ethnohistorians, and indigenous people themselves have helped dispel this stereotype. Today it is recognized that a wider range of sociocultural variation existed across the continent and through time than had previously been thought, overlapping in many ways with horticultural and agricultural societies like those of nearby Papua New Guinea. Aboriginal peoples had considerable control over the natural environment and its resources and managed these in ingenious ways.

Society, Religion, Demography

Although over two hundred Australian languages and many dialects were spoken across the continent, Aboriginal society shared many similarities. Society was kinship based; clans (descent groups) inherited land that was overseen by totemic ancestors shaped in the primeval Dreamtime (in Aboriginal belief, the time of creation). Complex patterns of kinship and social networks bound together large sectors of the continent. Trade, exchange, and ritual provided a further

binding force. In some cases, trade and exchange networks extended from one corner of the continent to the other. Basically egalitarian, Aboriginal society also had powerful and influential elders—men and women initiated into the hierarchies of the religious system and its cults. A conservative estimate of some 300,000 for the Australian Aboriginal population at the time of European settlement has been suggested, but more recent studies, which allow for the decimating effects of introduced diseases and conflict (by-products of colonialism), have increased this three- or fourfold. More fertile sectors of the continent, such as the southeast and the eastern and northern coastlines, were densely populated in comparison with other parts of the world inhabited by hunter-gatherers.

Resource Management

Land and resource management practices were central to Aboriginal economies. These involved use of fire, processing techniques, and storage. For example, more intensive and costly strategies, in terms of energy expenditure, were aimed at stockpiling stores for lengthy, populous, intergroup ceremonial occasions that ran for weeks and months of each year. In arid and semi-arid Australia, which comprises two-thirds of the continent, grass seeds and other seeds were managed, stored in quantity and made into bread on a daily basis. In these harsh regions, extensive loose, open social networks cemented relations between far-flung peoples, operating as elaborate safety harnesses that could be called upon in times of need. In richer, humid regions, like the tropical north and temperate southeast, social networks were bounded territorially, reflecting denser, more competitive populations.

Aboriginal rock art, Ayers Rock, Northern Territory.
Photo by Kevin Connors
(www.morguefile.com).

Here, a sedentary way of life also was more common. In Victoria and the Murray River valley, for instance, villages were constructed, often atop large earth mounds. Intensive fishing was undertaken day and night, and extensive drainage systems were dug to control eel runs and their productivity. Along the tropical coast and its offshore islands, specialized fishing societies flourished that focused on hunting dugongs (aquatic mammals similar to sea manatees) from seagoing canoes. Plants were managed in a form of domiculture (symbiotic relationship between humans and undomesticated plants) centered on more sedentary base camps.

Tasmania

The Tasmanians were isolated from mainland Australia for some 12,000 years, but were linked biologically, linguistically, and culturally to southeastern Australians. There were also some differences reflecting no doubt their cultural isolation and history. For example, apart from along the humid west coast, settlement appears to have been more mobile than

in environmentally comparable areas of southeastern Australia. Population densities were also lower than in the latter areas. Fishing no longer was practiced and equipment was generally less extensive, as befits more-mobile economies. Archaeological investigations suggest that during the last 4,000 years rain forests were more extensively utilized, coastal strategies rearranged, and populations may have expanded on the west coast.

Aboriginal Arrival in Australia

Plentiful, well-dated archaeological sites support that Aborigines colonized Australia some time before 40,000 years ago, when both Papua New Guinea and Tasmania were connected to Australia (Greater Australia). Earlier dates, however, are continually being entertained and heatedly debated. For example, recent redating of a Lake Mungo (New South Wales) skeleton, which was originally dated to around 30,000 years, has arrived at dates of twice that age and more. All skeletal data can be linked to the present indigenous population.

Aboriginal peoples throughout history, no longer defined stereotypically as hunter-gathers, had considerable control over the natural environment and its resources. Library of Congress.

Linguistically, Australian languages share much in common and have little close association with languages outside Australia apart from some in Papua New Guinea. Archaeological data indicate that by 35,000 years ago occupation stretched from the tropics to around the temperate Tasmanian glaciers. By 30,000 years ago, most major environments of the continent were peopled, with the arid core being populated shortly after. The human population appears to have had little dramatic effect either upon major vegetation patterns, vulnerable to Aboriginal burning practices, or fauna. People and now extinct Pleistocene fauna (including megafauna) appear to have co-existed for tens of thousands of years. After the glacial maximum 18,000 years ago, the numbers and use of archaeological sites increased in many environments of Greater Australia. This general trend may be a reflection of climatic amelioration and continues throughout the more humid period after 10,000 years ago, becoming most marked in the last 4,000 years, even though climate at that time became drier and more

stressful. In general this trend suggests increasing Aboriginal population sizes and densities even in the face of climatic reversal. Archaeological evidence of related cultural changes begins after 18,000 year ago but is most marked in the last 4,000 years. For example, from 4,000 years ago cemeteries in southeastern Australia, which begin around 13,000 years ago, are larger and more complex, and painted rock art styles in northeastern Australia become highly regionalized. At this time also, in arid and semiarid regions use of grass seeds is intensified and many environments are more intensively occupied, including the harshest deserts, some offshore tropical islands, tropical rain forests, and southeastern wetlands and highlands. This suggests increases in population sizes and densities and more intensive, more territorial socioeconomic patterns.

On reexamination, therefore, Aboriginal Australia, although culturally unique, also begins to demonstrate in many subtle ways some of the same patterns and trends found among hunter-gatherer peoples on other continents. Prior notions of a timeless people in a timeless land have given way to more dynamic portrayals.

Austro-Hungarian Empire

The Ausgleich of 1867, a compromise between the Habsburg rulers of Austria and the Magyar nobles of Hungary, created the constitutional dual monarchy of Austria-Hungary. The empire grew and developed economically under the shared government by the Austro-German and Magyar (Hungarian) minorities, but the diverse nationalities of its subjects led to its disintegration during World War I.

In 1867 the Ausgleich (compromise) transformed the monarchy of the Habsburg ruling house of Europe, which had existed since 1526, into the dual state of Austria-Hungary. Count Friedrich Ferdinand von Beust (1809–1886), the Austrian foreign minister, and Count Gyula Andrassy (1823–1890), a prominent Hungarian nobleman, conducted the final negotiations of the compromise. The then-ruling Emperor of Austria, Franz Joseph (reigned 1848–1916), viewing his lands essentially in terms of maintaining dynastic power and prestige (*Hausmacht*), sought to avenge losses suffered during the Italian War of 1859 and the Austro-Prussian War of 1866, which had stripped the monarchy of its territories in Italy and undercut its position in Germany. A continuation of the struggle against Prussia, however, required Hungarian cooperation. Hungarian leaders, determined to control non-Magyar (the dominant people of Hungary) populations in their part of the monarchy, wanted to remain connected to a great European state under conditions that maximized Hungary's autonomy within the larger whole.

The Nature of the Dual Monarchy

Extended consultations produced a compromise between the dominant Austro-Germans and the Magyars. The Ausgleich in effect created two distinct states, each organized as a constitutional dual monarchy. Franz Joseph and his successors would tie together the two independent and equal states by functioning as emperor of Austria and king of Hungary. The Habsburg ruler would appoint common ministers of finance, foreign affairs, and war as well as the ministries of the separate states, thereby preserving dynastic authority over the joint armed forces and the conduct of foreign policy. Delegates from the respective parliaments would meet on a rotating basis in Vienna and Budapest to settle matters of shared concern. The Ausgleich soon led to the creation of unified monetary and postal systems, a central bank, an integrated railroad network, and a customs union sheltered behind a single tariff.

Despite the ramshackle character of the dual monarchy, governmental structures functioned with surprising efficiency and allowed Austria-Hungary to retain its status as an important counterweight in the European power balance. However, in an age when nation-states had become the paramount form of political organization in the Western world and when the colonial possessions of the United States, Japan, and a small circle of European countries were becoming the dominant mode of imperial organization, Franz Joseph's empire represented an anachronism as potentially unsettling to continental stability as it was itself endangered by internal tensions and conflicts. For reasons resembling the failure of the new U.S.

republic to confront the question of slavery at the time of its founding, those leaders who negotiated the Ausgleich did nothing to resolve the nationalities problem facing the dual monarchy.

The Ausgleich used the River Leith to divide Franz Joseph's possessions. The empire of Austria (Cisleithania) contained Germans located primarily along the Danube River and in the Alpine areas of the old hereditary lands (Erblände), Slovenes in the provinces to their south, Czechs in the Bohemian Crown lands, Poles, Ruthenians (Carpatho-Ukrainians), large concentrations of Jews in Galicia, and Romanians in Bukovina. Italians inhabited the south Tyrol and the Adriatic coast. In the other part of the dual monarchy, Magyars lived on the plains traversed by the Danube and Tisza rivers and in eastern Transylvania. Slovaks lived to their north, Croats and Serbs to their south. Bosnia-Herzegovina contained substantial numbers of Muslims. In addition to pockets of Germans scattered throughout the kingdom of Hungary, Romanians occupied much of Transylvania. Nowhere did ethnic patterns coincide with historic borders, and nowhere could boundary lines be drawn that did not divide peoples of common descent who spoke the same language and shared a cultural heritage. Both the Germans and the Magyars constituted less than one-half of the population in the areas of the dual monarchy where the Ausgleich had ensured their predominance. The Germans, like the Poles, Ruthenians, Romanians, Serbs, and Italians, were developing emotional ties with peoples of their own nationality inhabiting lands lying beyond the dual monarchy's borders.

Sources of Imperial Strength

Despite its lack of geographical cohesion and the centrifugal (tending away from centralization) forces of nationalism, Austria-Hungary managed to survive until military defeat in World War I finally precipitated its disintegration. The attachment that many of Franz Joseph's subjects exuded for their emperor-king made him an indispensable source of stability. His long

Franz Xavier Winterhalter. *Franz Joseph I, Emperor of Austria* (1865). Oil on canvas. The emperor viewed his lands in terms of maintaining dynastic power and prestige. Private collection.

reign, venerable family heritage, steadfast demeanor, and unwavering commitment to his responsibilities elicited widespread devotion and support. Loyalty to this embodiment of the multinational Habsburg state remained strong in the armed forces, which imparted useful skills and broadening life experiences to soldiers and sailors of diverse backgrounds. Dedication to duty likewise remained high in the civil service, where bureaucrats played an increasingly influential role in society. The Roman Catholic Church, although

Historic map of nationalities in the Austro-Hungarian Empire in 1911.

diminishing in power, as well as the landed aristocracy throughout the empire, continued to pledge firm allegiance to the Habsburg dynasty.

Economic development provided another source of unity for Austria-Hungary. The growth of industry, notably the rising output of porcelain, textiles, and armaments in Bohemia, complemented the agricultural productivity of Hungary. The construction of railroads, expansion of banking, integration of regional markets—and therefore interdependence of various regions—all reinforced the dual monarchy's economic interaction. On the other hand, the spread of industrialization intensified nationality problems, and growing numbers of impoverished peasants, driven

by demographic pressures, streamed into the larger cities, accelerating the urbanization of society.

Vienna, whose inhabitants had numbered around 400,000 in 1848, mushroomed into a metropolis of 1.6 million by 1914. A once-predominantly German population became extraordinarily diverse ethnically, linguistically, socioeconomically, and culturally. As in other urban centers of the dual monarchy, such diversity probably contributed to its flourishing intellectual and artist life. Late nineteenth-century Vienna nurtured the work of Arnold Schoenberg and Gustav Mahler in music, Arthur Schnitzler and Hugo von Hofmannsthal in literature, Gustav Klimt and Egon Schiele in painting, as well as Sigmund Freud

in psychiatry. Its university boasted world-renowned figures in fields ranging from history and philosophy to economics, medicine, and law. Despite its splendor, however, Vienna could not avoid the divisions and strife that came with its size and diversity. Here, as elsewhere in Franz Joseph's domains, national consciousness and accompanying feelings of grievance became more acute whenever economic expectations, educational levels, and degrees of social sophistication rose significantly.

Developments in Austria

Pervasive nationality problems invariably complicated other political problems. Although the Austrian constitution guaranteed many basic rights, including the right of every national group to uphold its own language, religion, and culture, the right to vote operated through a class system designed to ensure the dominance of Germans in parliament. Immediately after 1867, a period of liberal ascendancy under Franz Joseph's prime minister, Prince Carlos Auersperg (1814–1890) brought a series of reforms that broadened trial by jury, introduced free and compulsory elementary education, diminished the influence of the Catholic Church over education and its control over marriage and family law, established universal military service, reduced the severity of the penal code, outlawed discrimination against Jews, and accorded all Christian faiths legal equality.

The creation of the German Empire by Prince Otto von Bismarck after the Prussian defeat of France in 1871 dashed Franz Joseph's aspirations to reassert Habsburg dominance in central Europe. Fears of losing Austria's German-speaking lands to the newly united Germany brought to power a more conservative ministry under Count Karl Sigismund von Hohenwart (1824–1899). It attempted to appease the Slavic population by reorganizing the empire on a federal basis. Efforts to give the Czechs a status equal to that of the Magyars met with unyielding resistance from the two master nationalities, but the Hohenwart ministry did ensure the adherence of Galicia's Poles by granting them administrative and cultural autonomy. Another liberal ministry

led by Prince Adolf Auersperg (1821–1885) introduced the direct election of parliamentary representatives, which resulted in a Czech boycott because the reform favored urban and hence German voters.

Prolonged economic depression, political corruption, and liberal opposition to a foreign policy now directed by Andrassy compelled Franz Joseph to name Count Eduard Taaffe (1833–1895), a conservative Bohemian aristocrat, as his chief minister in 1879. Taaffe organized a political coalition of Slavs, clericals, and German conservatives known as "the iron ring." He achieved stability by making concessions to his supporters without ever addressing their deepest discontents or resolving severe fiscal problems facing the Austrian government. Recurring political crises followed his resignation in 1893. The attempt to diminish opposition among aggrieved minorities with an election law that provided universal manhood suffrage failed to restore order to the parliamentary process.

The Position of Hungary

In their part of the dual monarchy, Hungarian leaders proved unable and often unwilling to address the grievances of subject peoples. Magyar landowners dominated the political process and utilized their power to assimilate or subjugate the other nationalities through relentless efforts at Magyarization. Only Croatia possessed a degree of administrative autonomy that gave its peoples their own diet, courts, and schools. Kalman Tisza (1830–1902), head of the Liberal Party and prime minister from 1875 to 1890, sought to uphold the *Ausgleich* while enhancing Hungary's position within the dual monarchy. A resurgent Independence Party under the direction of Ferenc Kossuth (1841–1914) assumed control of the government in 1890 and complicated relations with Austria until 1910 by pressing for a virtually separate Hungary. Istvan Tisza (1861–1918), who served as prime minister from 1903 to 1905 and again from 1913 to 1917, revised the Hungarian agenda. Determined to uphold the *Ausgleich*, he still increased his country's prerogatives and influence whenever possible.

Foreign Affairs

Unremitting internal difficulties encouraged the leaders of Austria-Hungary to pursue an expansionist foreign policy. For reasons of dynastic prestige, military security, and economic advantage, the imperial and royal army occupied the Turkish provinces of Bosnia and Herzegovina in 1878. This occupation counterbalanced the recent loss of territory in Italy and alleviated fears that an intensifying South Slav *irredenta* aimed at the inclusion of Croatia and Slovenia in an independent Slavic state, and the political aspirations of Serbia, which sought to become the center of this imagined state, might unsettle minorities living within the dual monarchy. But the occupation complicated relations with Serbia, Italy, and Russia, which itself had ambitions in the Balkans, and pushed Austria-Hungary into a defensive alliance with Germany the following year.

The dual monarchy aroused heightened resentments when it formally annexed Bosnia and Herzegovina in 1908. The annexation raised serious questions in every European capital concerning Austria-Hungary's intensions in the international sphere and increased its dependence on Germany, which had provided crucial if reluctant support. The annexation weakened the Triple Alliance, consisting of Germany, Austria-Hungary, and Italy, by alienating Italy and reinforced Russia's commitment to the Triple Entente, which by 1907 had diplomatically tied Russia to England and France. By provoking further Serbian agitation among the dual monarchy's South Slavs, the annexation ensured further trouble in southeastern Europe. Two Balkan wars during 1912–1913 left Serbian territorial aspirations unfulfilled, an outcome for which Serbian nationalists held Austria-Hungary responsible. Then, on 28 June 1914, young Bosnian extremists with connections in the Serbian capital of Belgrade assassinated Crown Prince Franz Ferdinand and his wife in Sarajevo, the Bosnian capital.

Consequences of World War I

The Austro-Hungarian government, feeling threatened, declared war on Serbia on 28 July; Russia's

backing of Serbia and Germany's support of Austria-Hungary, its only reliable ally, set off mobilizations that turned a Balkan crisis into a European war. During the opening campaigns Austria-Hungary's army suffered nearly 50 percent casualties and lost many experienced officers. Yet loyalty to Franz Joseph and his multinational dual monarchy remained strong. Victories in Italy, Serbia, and Romania restored morale but could not prevent hardship within the civilian population, and thus left effective authority with soldiers and bureaucrats. Subsequent military setbacks, restrictions on individual rights, mounting shortages, and a dependence on Germany rekindled nationalist animosities and ambitions.

The last Habsburg emperor-king, Karl I (r. 1916–1918), failed to make a separate peace with Allied leaders in France and England, who belatedly recognized the need to break up his empire after their victory. The collapse of offensives mounted by Germany and Austria-Hungary during spring and summer of 1918 paved the way for an abrupt disintegration of the dual monarchy. In October the leaders of various national groups used Allied recognition to declare the independence of Czechoslovakia, Yugoslavia, and an expanded Romania. Territorially reduced states of Austria and Hungary set up republican governments after Karl I resigned in mid-November. Galicia became part of a new Poland. The end of the monarchy ruled by the Habsburg dynasty for nearly four hundred years left small successor states facing long-standing nationality conflicts in a now deeply divided east-central Europe.

Automobile

A series of improvements turned the steam-propelled carriages of the late eighteenth century, mere amusements for nobles, into the 600 million automobiles that crowd the roads of the world's developed areas—and automobile and fuel technology innovation is likely to continue. The development of the mass produced personal vehicle has had a profound, though not entirely positive, effect on the Earth's population.

The automobile has been one of the defining technologies of the last one hundred years. From its roots as a European technological curiosity to its reinvention as a mass consumer product to its current status as the product of the largest manufacturing activity on earth, the automobile has fundamentally changed the global economy and the lives of most people, even those who do not drive.

The earliest cars, a strange blend of the eccentric and the practical, were built long before people such as Gottlieb Daimler (1834–1900), Henry Ford (1863–1947), Ransom Olds (1864–1950), Carl Benz (1844–1929), William Durant (1861–1947; founder of General Motors), James Packard (1863–1928), and Clement Studebaker (1831–1901) entered the scene. During the fifteenth century the Italian artist and engineer Leonardo da Vinci thought about carriages that could move under their own power and left drawings showing rudimentary transmission and steering systems. In 1510 the German Renaissance artist Albrecht Durer sketched a complex and undoubtedly heavy royal carriage, propelled by muscle power through geared cranks.

The early history of the automobile gives little indication of the long-range impact of its technology. Beginning in Europe during the 1870s, research and invention led to development of the first gasoline-powered automobiles in the 1880s. The international character of automobile enthusiasts and inventors during the late nineteenth and early twentieth centuries is representative of the scientific and technological culture, where news traveled quickly between continents.

At the heart of any car is its engine, and the development of the internal combustion engine was pursued separately from and earlier than that of the automobile. Initial research into internal combustion engines was motivated by desires to improve on the efficiency and portability of the steam engine.

Full Steam Ahead

Until the first practical internal combustion engine was developed in 1860, constructing a workable steam car was the obsession of scientific geniuses and eccentrics, most of who received only scorn and ridicule for their trouble. Historians can only imagine the scene in Paris in 1769 when Nicholas Cugnot (1725–1824), a French military engineer serving Empress Maria Theresa of Austria, retired from active duty and began working, under royal commission, on his idea for a steam-powered military truck. The truck may have been capable of only 11 kilometers per hour, but it did move. This, the world's first automotive test drive, sufficiently shook loose royal purse strings to fund a second and larger model. Cugnot's second truck had front-wheel drive, with the boiler

A 1960s-era car in London. During the 1960s the British company Austin partnered with Japan's Nissan to design and produce the revolutionary Mini.

hanging off the nose, a design that resulted in such an unbalanced weight distribution that a driver could barely steer the vehicle.

Following in Cugnot's Tracks

After Cugnot, developments shifted to England, where the significance of the technical breakthroughs was met by public apathy. After all, who could imagine that these outlandish contraptions, easily outrun by even the slowest horse, could be practical?

James Watt (1736–1819), the Scottish inventor whose technical innovations made the Age of Steam possible, was granted a patent for a steam carriage in 1786 but did not actually build it. Watt was so afraid of explosions from high-pressure boilers that he had a covenant written into the lease for any potential tenants of his home, Heathfield Hall, stipulating that no steam carriage could approach the house.

In the United States steam pioneers faced ridicule and censure too. Oliver Evans (1755–1819) is not well remembered today, but he built the first self-propelled vehicle in the United States—and it also *swam*. Evans also built the first high-pressure boiler in the United States and created an automation system for a grain

mill that prefigured Henry Ford's assembly-line system by 150 years.

Obstacles to the Dream of Steam

Inventors struggled to make their fire-belching vehicles practical. Nevertheless, English entrepreneur Walter Hancock was the first to offer regular passenger routes of the type that Evans imagined. For five months at some time during the period 1824–1836 Hancock had nine steam coaches taking on paying customers. However, Hancock's revolutionary coach service didn't attract enough passengers, and ultimately failed. It's probably going too far to say a conspiracy killed the steam coaches, but certainly the powerful railroad interests threw some spikes onto the road. As automotive writer Ken Purdy reports in his classic book *Kings of the Road*: "The railroads of the day took a very dim view indeed of the kind of competition steam coaches obviously could offer, and arrangements to make things difficult for the upstarts were not hard to contrive. A four-shilling toll-gate charge for horse-drawn coaches, for example, could easily be raised to two pounds and eight shillings for a steam coach" (Purdy 1949, 196).

Steam carriages during the next half-century would make their mark, particularly in the United States. Government Indian agent Joseph Renshaw Brown commissioned one particularly innovative model, shaped like a railroad locomotive, to carry supplies and food to isolated bands of Sioux before the Civil War, although the bad roads in the hinterlands of Minnesota made the carriage impractical. Brightly painted steam fire engines were more successful in several cities after the war. Steam cars survived the onslaught of internal combustion during the first decade of the twentieth century, and brands such as “Stanley,” “Locomobile,” and “White” had many admirers who loved the cars’ range, silent operation, and absence of a crank handle (a necessity for an internal combustion engine in the days before electric starting). This latter advantage was a prime consideration in an era when misapplied cranking could break one’s arm.

However, Whites and Stanleys could require half an hour to work up a head of steam, frightened people who read accounts of boiler explosions, and consumed great amounts of wood fuel and water. When rapid technological advancements improved

the gasoline engine after 1905, the market for steam cars evaporated.

Current Events

Electric cars developed out of early experiments with electric trains and trolleys and became possible only with the invention of the practical storage battery in 1859. A three-wheeled carriage made by Magnus Volk of Brighton, England, in 1888, may have been the first true electric car.

In the United States electric cars first made a discernible impact through their use as taxis, particularly in New York City. By 1898 the Electric Carriage and Wagon Company had a fleet of twelve electric cabs—with well-appointed interiors able to accommodate gentlemen in top hats—plying the city streets. Drivers, as in contemporary horse carriages, sat outside on a raised platform.

The electric car gradually won acceptance through such small-scale, successful businesses. By 1900 U.S. drivers could choose their form of locomotion, and at the first National Automobile Show, held that

A decorated and decked-out German family camper set to make a tour of Europe.

November in New York City, patrons overwhelmingly chose electric as their first choice. Steam was a close second. Gasoline ran a distant third, receiving only 5 percent of the vote. That year 1,681 steam, 1,575 electric, and only 936 gasoline cars were manufactured.

Unplugged

The self-starter for internal combustion cars—the device that largely killed the electric car as a viable product—was, like the electric car itself, first marketed to women. A 1911 ad from the Star Starter Company (“Any Woman Can Start Your Car”) featured a bonneted woman sitting at the wheel of a crankless gas buggy. By “cranking from the seat, and not from the street,” she was neutralizing one of the last major advantages that early electric cars had.

Recharged?

Electric cars have made sporadic reappearances, mostly in response to fuel crises such as the oil embargo by the Organization of Petroleum Exporting Countries (OPEC) in 1973. However, most electric cars have been underdeveloped conversions, such as the utility-endorsed Henney Kilowatt of 1959 to 1961, which started life as a French Renault Dauphine gasoline-powered car. About 120 Henneys were built, which is a good run for a postwar electrical vehicle (EV).

The Gas-Powered Automobile

In 1860 the Belgian inventor J. J. E. Lenoir invented a gas engine that was similar to James Watt’s double-acting steam engine, except that when the piston rose it drew a mixture of coal gas and air into the cylinder. The mixture was ignited by an electric spark. Lenoir’s engine, although plagued by overheating, was a commercial success. The market for gas engines opened, and similar inventions followed, the most important of which was the gas engine of the German inventor Nicolas Otto, who patented his engine in 1866 and exhibited it at the Paris Exhibition of 1867, where it won a gold medal. Otto’s engine, unlike Lenoir’s,

compressed the gas before igniting it, with the small detonation pushing the piston up and forming a near vacuum under it. Otto’s engine weighed nearly a ton and produced all of two horsepower. However, the piston was vertical and occupied a small space, making it practical in workshops that were too small for a steam engine. Otto’s engine was an immediate success, and his company was soon overwhelmed by six thousand orders during the next five years. By 1869 Otto was licensing the invention for production in the United States, Britain, France, and elsewhere. However, his engines required gas mains to carry the gas to the engines; therefore, they were not portable in the sense that a liquid-fuel engine would be.

The internal combustion engines of the 1870s required gas to be compressed and ignited—properties not possible with liquid fuel. The invention that made liquid fuel usable was the carburetor, a device that vaporizes gasoline and makes it possible to be compressed and then ignited. The carburetor was the first product of the company formed by Wilhelm Maybach and Gottlieb Daimler of Germany. By 1885 the two men had attached their gasoline engine to a bicycle to produce the world’s first motorcycle. In 1886 they attached their engine to a carriage to produce an automobile. In 1890 they formed the Daimler Motor Company to manufacture automobiles. They also sold their engines to the Peugeot carriage company in France.

In 1892 the German engineer Rudolf Diesel applied for a patent on a more powerful double-acting, liquid-fuel engine. His engine compressed air to heat it to the fuel’s ignition point, then introduced the fuel, which instantly ignited, producing power without further heating of the air. Diesel’s principle led to a more efficient, more powerful engine that ran on a less refined product of petroleum oil than gasoline—a fuel now called “diesel.” Diesel wanted to challenge the steam engines used in ships and locomotives—a goal he reached by the turn of the century.

Heavy Traffic

Automobiles were a common sight in European and U.S. cities by the twentieth century. But to become

An idealist is a person who helps other people to be prosperous. • **Henry Ford (1863–1947)**

1904 Buick, one of the first cars designed by the engineer Walter Marr for David Buick. New York Public Library.

a worldwide phenomenon, automobiles needed to be less expensive and more useful. Although several inventors focused on making the automobile accessible to the masses, Henry Ford is associated with the milestone of making the world's first motor car for the multitude. Although the Model T was not his first automobile design, Ford began designing it in 1907 with the goal of making a utilitarian car affordable for the U.S. middle class—and in the process redefining that middle class through car ownership. The Model T rolled out in 1908 at a price of \$850, advertised as the car “even you can afford.” But the 1908 Model T was neither the world's least expensive car, nor the one produced in the largest numbers. For the Model T to capture a mass market, Ford had to revolutionize how it was produced. This he accomplished with what Ford called “mass production.” In 1913 Ford opened a plant in the Highland Park area of Detroit, where he installed his first assembly line. Assembly lines and production by machines required fewer skilled laborers. Ford's new production methods changed the character of industrial labor and attracted foreign-born workers, particularly from eastern and southern Europe and the Middle East. In order to retain his employees in this machine-based, repetitive work, Ford doubled their daily wage to five dollars and reduced their working day to eight hours.

Ford's mass production techniques led to cheaper (as low as \$360 in the 1920s) and more numerous Model Ts.

Ford was producing more than 1 million Model Ts by 1920. The amount of materials required to produce that many automobiles had a ripple effect across the world's economy and environment. The demand for commodities such as rubber and oil increased rapidly—creating new socioeconomic dynamics in areas such as Brazil and the Dutch East Indies, where rubber plantations proliferated. In addition, the role of the automobile in warfare, as proven during World War I, had brought a new emphasis in securing these commodities through imperial systems in the Middle East, Africa, and southern Asia. Demands for enough rubber, oil, and steel to produce and operate millions of automobiles also changed the world's environment: steel mills belched smoke into the air from Pennsylvania to the Ruhr Valley in Germany to India, and millions of acres of tropical forests were cleared to plant rubber trees. Oil derricks sprouted from the California coast to the Middle East.

Given the immense number of Model Ts, they and other inexpensive autos inevitably began to appear in places where people had never seen cars before. By 1904 Ford had set up a small subsidiary to sell cars in Canada. By 1910 Fords were being sold around the world, including in Mauritius, Kuala Lumpur, and Turkey. A Ford assembly plant opened in Manchester, England, in 1911 to serve the growing British and European markets. In addition, nearly five thousand U.S. cars, mostly Fords, were being exported every year. This amount only increased with the coming of war to Europe in 1914 and throughout the 1920s.

After World War I the Model T began to lose its overwhelming market advantages as competition from other manufacturers began to increase. Creation of the General Motors conglomerate led to a proliferation of competing car models, many of which had features that Fords lacked. In addition, during the 1930s Nazi Germany introduced the Volkswagen as a car for the masses. However, the worldwide economic depression of the 1930s slowed automobile market

growth. Rapid growth, especially in Asia, would re-emerge after World War II.

The Postwar Picture

Numerous shifts in the international automobile market have taken place since World War II. After the war the United States was clearly the world's dominant supplier, but by the 1960s the global automobile industry was shifting toward Asia. Korea and Japan have developed the most globally significant automobile industries. In Japan companies such as Mitsubishi have been producing vehicles since the 1920s. Japanese automobile factories suffered relatively light damage during the war and, as a result, the automobile industry was one of the first that the U.S. occupation allowed to resume production.

The outbreak of the Korean War in 1950 provided Japan with an export market for vehicles, and by 1952 the Japanese Ministry for International Trade and Industry (MITI) was creating conditions favorable for exporting Japanese autos. Japanese manufacturers also teamed with European companies to produce Hillmans, Austins, and Renaults. In 1955 MITI again directed the industry with a new strategy for small, inexpensive automobiles. Japanese companies began to excel in the production of these cars, creating an international niche where Japanese cars could undercut European and U.S. cars. By the 1960s the U.S. counterculture had found a surprisingly consumerist way to avoid supporting the U.S. automobile industry and its ties to the defense industry—it bought Japanese cars.

The oil crisis of 1973 increased international interest in small, fuel-efficient Japanese cars. The explosion of the international market for Japanese cars was marked by the changing output of the Japanese industry—from less than a half million cars in 1960 to 7 million in 1973. Japan had become the world's second-largest automobile producer, and its automobile industry, along with its consumer electronics industry, was the driving engine of Japan's postwar "economic miracle." Korea followed the Japanese model during the 1970s and by the late

1980s became the first new major exporter to the industrialized nations since Japan's emergence during the 1960s.

The Modern Era: Power and Pollution

The U.S. vehicle population since 1969 has grown six times faster than the human population and two times faster than the rate of new drivers. Despite comprising only 5 percent of the world's population, U.S. drivers own 34 percent of the world's cars. Registrations of new cars in the United States increase by 2 percent each year. By the year 2100 the current 600 million cars registered worldwide (one-third of them in the United States) could reach 4.5 billion. China, the world's most populous and rapidly industrializing country, is leading the Third World rush to "modernize" through the use of private cars. Although almost 80 percent of its travel is now either by foot or bicycle, China could have 100 million cars by 2015. Tata Motors of India, the world's second most populous nation with around a billion people, is helping to make the dream of car ownership a more accessible reality through the manufacture of the Tata Nano, the world's cheapest car at around \$2,300.

Because of this global mania for private automobiles, together with the means to acquire them, experts project a huge increase in the world car population during the next one hundred years. Because cars account for one-third of smog-related emissions and one-quarter of global warming, such an increase would obviously have disastrous consequences for global health. In half the world's cities the greatest source of air pollution is exhaust emissions; the World Bank estimates that in Asia thousands of people die prematurely every year from filthy air. The problem is worst in China, which relies heavily on coal, but the problem is bad elsewhere. In Athens, Greece, the death rate increases 500 percent on bad air days. In Sao Paulo, Brazil, clogged streets and dirty air have forced officials to set up a rotation system for drivers to keep one-fifth of the city's cars off the streets at any given time. In Tel Aviv, Israel, cars are a huge problem: by 2010 smog is predicted to reach the

levels of Mexico City (the worst in the world, with ozone levels three times safe limits); already smog has caused outbreaks of asthma and bronchitis in Tel Aviv and in nearby Jerusalem. In Prague, Czech Republic, smog forces police to set up roadblocks to keep all but essential traffic out of the city center. Drivers in Singapore pay a premium for licenses that allow them unlimited access to highways.

But even as we realize what our continuing reliance on the private automobile is costing us, we add 50 million of them to the global burden every year. Whether they are in China or the United States, cars are pollution factories on wheels. The average gasoline-powered car in one year produces 4.5 metric tons of carbon dioxide, which causes global warming.

Sport Utility Vehicles

Despite Japanese-led efforts to produce lower emissions cars, the rapid growth of the gas-guzzling sport utility vehicle (SUV) has obliterated advances in clean engine technology, especially in the United States. In 1985 SUVs accounted for only 2 percent of new vehicles sold in the United States; in 2003 they were the most popular form of vehicle, accounting for more than 25 percent of sales, and in 2004 SUVs accounted for 24.6 percent of sales. No other country has taken to SUVs so enthusiastically, but they are an increasingly familiar sight on roads around the world.

In the United States SUVs are considered to be light trucks and thus are allowed to pollute more than cars. According to Friends of the Earth, an environmental advocacy group, a Volkswagen New Beetle (a small car) will emit close to 49 metric tons of carbon dioxide during its lifetime, whereas a Lincoln Navigator (an SUV) will emit 90 metric tons. The National Academy of Sciences reports that light trucks (including SUVs, pickups, and minivans) could reach a fuel efficiency of 13 kilometers per liter (30 miles per gallon) with an expenditure of \$1,200 to \$1,300 per vehicle, but they are required to meet only the federal light-truck standard of approximately 9 kilometers per liter (20.7 miles per gallon). In 2000 General Motors and Ford

announced efforts to improve fuel economy for SUVs, but the vehicles still lag behind. The EPA estimates that a 1.2 kilometer-per-liter (3 mile-per-gallon) increase in average fuel economy would eliminate 140 metric tons of carbon dioxide emissions and save \$25 billion a year in fuel costs annually.

Other Environmental Problems

Beyond the tailpipe, one-third of the average U.S. city's land is devoted to serving the car, including roads, parking lots, and service stations. Jan Lundberg, an anti-car activist and founder of the Alliance for a Paving Moratorium, says asphalt covers 96,000 square kilometers of the United States, obliterating 16 million hectares of farmland. Ten percent of the arable (fit for growing crops) land and 2 percent of the nation's surface area are covered, he says.

Daily commutes are also increasing as cities sprawl farther into suburbs. In the United States an hour a day in the car has become the norm. The average U.S. family takes ten car trips a day, mostly to shop, recreate, or socialize. For every 16 kilometers a person travels, approximately 14 kilometers are traveled in a car. The U.S. interstate highway system is completed, but \$200 million is spent every day improving, repairing, and building roads in the United States. Parking enforcement and traffic management on those roads cost \$48 billion annually, and another \$20 billion goes to routine maintenance. However, the National Transportation Board predicts that delays caused by congestion will increase by 5.6 billion hours between 1995 and 2015, wasting 28 billion liters of fuel. The federal General Accounting Office estimates the loss of national productivity resulting from traffic congestion at \$100 billion a year. Seventy percent of all daily peak-hour travel on interstates now occurs in stop-and-go conditions.

Reinventing the Wheel

Fortunately for the human race, alternative fuel technology has continued to develop, and replacements for the internal combustion engine may at last be

practical. Fuel cell technology, which was first demonstrated in principle in 1839, can be compared to car battery technology: both fuel cells and traditional car batteries produce electricity. The difference is that batteries store both their fuel and their oxidizer internally, which means that periodically batteries must be recharged, whereas fuel cells, like a car engine, can run continuously because their fuel and oxidizer are not sealed up inside them.

Although several kinds of fuel cells exist, developers are considering only one type, the proton-exchange membrane (PEM) cell, for cars. The modern work on fuel cells is all fairly recent, but the technical problems of the cells themselves have been mostly worked out, and the main obstacles concern building a worldwide infrastructure for hydrogen production and distribution. Fuel-cell buses preceded passenger cars onto the road, appearing in the late 1990s. Fuel-cell cars keep appearing in very small numbers (not really prototypes, but certainly not production scale vehicles, either). Most automobile developers are putting some varying level of R&D into fuel-cell development. In addition, government labs in most industrialized nations are also researching the problems of manufacturing and distributing hydrogen production technologies. However, even with the presence of fuel cars on our roads, analysts don't expect hydrogen vehicles to have a serious impact on internal combustion cars until 2015 or 2020. When hydrogen vehicles arrive, they promise a new era of sustainable, zero-emission cars and trucks.

Auto manufacturers have been forced to recognize that the future of motoring must change. The global financial and economic crises of that began in 2007 saw a lot of major car companies in serious financial trouble and requiring government bailouts. Combined with growing environmental concerns, car manufacturers have been forced to restructure and abandon some of their longstanding yet inefficient "gas guzzler" models. There is a general push for more compact, fuel efficient, and low emissions cars, including under the leadership of Japanese manufacturers, Toyota (Prius model, now in its fourth generation) and Honda, a surge in "hybrid" petrol-electric

engines. More fuel-efficient and low-emitting turbo diesel engines popular with European manufacturers are also increasing in popularity in other markets.

The Road Ahead

Although people think of the automobile as a symbol of the developed world, its impact in environmental, economic, and social terms has not been limited to wealthy nations. During the twenty-first century virtually every nation produces automobiles and automobile parts, and commodities peripheral to automobiles, from rubber to oil, play major roles in the global political economy. The automobile industry has become global in that automobile manufacturers view the world as a single market instead of as a series of nationally defined, discrete markets. Manufacturers also view production as borderless, with both automobiles and their components moving seamlessly between Europe, the United States, Asia, and Latin America. However, automobiles also present an environmental challenge that is borderless.

Aviation

The airplane invented by the Wrights in 1903 found few practical uses until World War I, when its role in warfare led to rapid improvements in speed, range, and reliability. Further leaps forward during World War II paved the way for the air travel of today—safe and affordable for hundreds of millions of passengers.

Wilbur and Orville Wright are credited with inventing the airplane in 1903. What separated the brothers from all those before them who tried to build such a craft was, simply, that the Wright airplane was capable of sustained, powered, and controlled flight. Air passing over a wing generated lift, while surfaces on the craft manipulated some of the air, providing directional control—all of this sustained by an engine that provided thrust.

For the next eleven years the airplane was a solution in search of a problem: no one seemed to know what to do with it. Even at the start of World War I, aviation's potential remained unclear—at least to the generals. But its flexibility soon became apparent, and the airplane found many roles in the war: air-to-air fighter, bomber, and observation platform.

War often leads to rapid technological advances. At the start of World War I most airplanes were at least biplanes—two wings—and were built of wood and fabric. Yet by war's end the Fokker Company was producing airplanes with welded steel truss fuselages, while the Junkers company built monoplanes made entirely of metal. Speed, range, and reliability increased as well. And while the first four-engine airplane predated the war (Russian designer Igor Sikorsky's *Rusky Vitaz*), multiengine bombers of colossal size were fairly common by the end of it.

Interwar Years—Dawn of Commercial Aviation

In the period between the two world wars aviation's commercial potential blossomed. Not only did planes fly passengers, they carried freight, mail, entertainers, and explorers. At the same time the airplane's use expanded from within the industrialized world to encompass the entire globe.

Europeans were the first to establish regular, lasting commercial aviation. Many of the large, multiengine airplanes that survived the war were modified to carry passengers. Using these, several European nations established national airlines offering service within the continent. Still possessing colonies around the world, these powers saw the airplane as a fast way to move people to and from their possessions. They subsidized the airlines because they were flagships—demonstrations of prestige and power—and because without the subsidy the airlines would have gone bankrupt.

By contrast, the United States was more restrained about direct government subsidies for commercial ventures; lacking a major sponsor, the airplane remained something of an orphan. The U.S. government did offer financial support through the airmail system, and private companies flew the airmail and an occasional paying passenger, but little effort was made to cater to passenger traffic. A pivotal moment for aviation came in 1930 with the restructuring of the method by which companies were paid for the mail they carried. Rather than paying strictly by the weight of the mail, the new formula factored in internal volume. This spurred aircraft manufacturers to design new and larger planes able to carry passengers

J. J. Hammond, the first pilot to carry passengers in a powered aircraft in Australia, and his Boxkite plane at Ascot Racecourse, Sydney, 5 May 1911. Photo by Sam Hood. State Library of New South Wales.

in enclosed cabins. Although the ruling applied only in the United States, it had ramifications the world over, for it led to the modern commercial airliner.

The airplane demonstrated its value in less developed parts of the world as well. Companies in South America employed single-engine airplanes such as the Junkers F-12 to reach remote outposts, while French Latecoeres carried mail from Europe down the west coast of Africa, and even across the Atlantic to Brazil.

Technological Developments

Although wood as an aircraft construction material had a long tradition, metal as an aircraft material grew in both popularity and use. This stemmed from several things: new knowledge about the properties of metal; new alloys; cultural embrace of a new material (such as duralumin) in place of an old one (wood); and aircraft accidents blamed on failed wooden components.

The development of the stressed-skin (monocoque) fuselage increased the useful internal volume of

aircraft. A monocoque fuselage is a shell in which the loads carried by the aircraft in flight are borne by the fuselage's skin. (An aluminum or composite canoe is an example of a monocoque shell.)

First proposed in the late nineteenth century, the idea of a variable-pitch propeller was impractical until aircraft routinely operated at more than 300 kilometers per hour; below that speed a fixed-pitch propeller performs well. The effect of changing the propeller's pitch—the angle at which the blade meets the air—is not unlike having gears on a bicycle.

Researchers found that shrouding the engine with a cowl would provide both better cooling (most engines at the time were air-cooled) and lower drag. This last item translated into higher efficiency and greater speed, and manufacturers worldwide quickly adopted the cowling.

In addition to ground-based weather stations set up to inform airborne traffic of conditions en route, new navigation instruments to assist pilots in finding their way in clouds became available in the 1930s. These included radio navigation, which allowed a pilot to follow a course without any visual references, and

The saying "Getting there is half the fun" became obsolete with the advent of the commercial airline. • Henry J. Tillman (1863–1947)

gyroscopes. The ability to navigate without visual references outside the aircraft was known as "blind flying" or "instrument flight."

In 1930 the Englishman Frank Whittle patented his idea for an aircraft turbine engine. Not long after he received his patent, Hans Joachim Pabst von Ohain, a German aeronautical engineer, conceived and designed his own turbine engine, independent of Whittle's efforts. Whittle was the first to operate a gas turbine aircraft engine, in 1937, but von Ohain's design was the first to actually power an airplane, when it carried an HE 178 into the air in 1939. Both British and German turbojet aircraft saw military service during World War II, but they came too late to prove decisive.

While these technological developments increased the reliability and practicality of airplanes, water remained the preferred landing surface for most long-distance aircraft. This was because land-based runways entailed construction and maintenance costs, whereas water did not, and seven-tenths of the earth's surface is water, affording almost limitless and free runways. Possessing numerous colonies around the globe, European nations found the airplane in general, and the seaplane in particular, the ideal means to establish quick access to other parts of the world. Great Britain led the way, with its large fleet of seaplanes crisscrossing the globe, carrying passengers and mail to Africa, Asia, and South America.

These and other developments came during a period in which there was little widespread public support for aviation. As often as not, aviation appeared more a sport than a practical pursuit, and it was uncommonly dangerous. Ironically, many of the technological advances came during a worldwide economic depression. Much of the push for these developments came from governments willing to support the fledgling technology for its potential, even while the marketplace remained skeptical about its value. This support usually came in the form of military funding, which, in the United States, kept several aircraft companies from failing.

In World War II the airplane was used in much the same way as it had been in World War I: as freighter,

strategic and tactical bomber, long-distance fighter, observation platform, and ground attack machine. One of the few dramatic evolutions was in naval aviation: World War II introduced the airplane as a potent naval weapon flying from floating airports (aircraft carriers). And once again, war led to accelerated technological developments, including the adoption of autopilots, instrument landing systems, turbo-supercharged intercooled engines of extraordinary power and complexity, and the first ejection seats for aircraft. In spite of the similarities in the airplane's use during the two world wars (a sign of a maturing technology), there were notable differences, among them the sheer number of airplanes produced for military use, and their capabilities. Both the Americans and the British, for example, regularly sent more than a thousand bombers on a single mission, each carrying several tons of bombs. The Boeing B-29 had a range approaching 6,500 kilometers and bomb payload of 10 tons. Even fighters could fly nearly 2,000 kilometers with additional fuel tanks.

With its extensive wartime use, the airplane's reliability ceased to be a major concern. Additionally, since most aircraft in the period had flown from land-based airfields, new airports dotted the land. These new airports, coupled with improved engines and greater endurance, spelled the end of the era of flying boats, once the mainstay of international airlines.

Postwar Aviation

Of the wartime developments, the turbine engine has had the greatest impact, for it dramatically increased the speed at which aircraft can fly. But researchers found that as airplanes approached the speed of sound (Mach 1), they encountered compressibility. As an airplane approaches Mach 1 it compresses the air in front of it, creating shock waves that cause a number of problems, chief among them control. A swept wing, with an angle of 35 degrees or more, delayed this compression and reduced the control problems.

Technological Developments

Flying at supersonic speeds—exceeding Mach 1—was the holy grail of the aviation industry. Solving the control issues associated with compressibility enabled the X-1 to exceed Mach 1, in 1947. This success led to true supersonic aircraft, almost all of which were and are built for military use. Two different types of supersonic airliners were built, but they proved too expensive to remain in service.

With the maturation of the airplane's shape and power, the next major development was the systems revolution: the advent of computerized control of aircraft and their systems in place of direct human and mechanical control. Unmanned aerial vehicles, or UAVs, enabled by the systems revolution, were the next step—aircraft that fly autonomously or are controlled by a pilot on the ground.

Computers, once rare, are now almost ubiquitous on modern aircraft, controlling or monitoring nearly everything related to flight. Linked to a network of satellites in the Global Positioning System (GPS), they enable one to navigate with remarkable precision and locate oneself anywhere in the world within a few meters or less.

Commercial Aviation

Following the end of World War II, the British had the greatest technological lead with turbine engines. Their De Havilland DH 106 *Comet* entered service in 1952, the world's first pure jet airliner. That decade saw a number of other jet airliners come to market as well, including the Soviet Tupolev Tu-104, the Boeing 707, the Douglas DC-8, and the Sud Aviation *Caravelle*. Unlike its competitors, the twin-engine *Caravelle* was built with an entirely new idea in mind—short-distance flights between smaller cities, rather than long-distance and even intercontinental flights that best suited the larger, four-engine aircraft. The *Caravelle* pioneered an entire category of commercial aircraft—the short-haul airliner. In all this, flying remained an exclusive, expensive, and fairly uncommon activity.

Unlike this balloon, first launched in 1784 by Vincent Lunardi in London, the Wright brothers' airplane of 1903 was capable of sustained, powered, and controlled flight.

Economy of scale forced a gradual change, however, and commercial airliners grew in size or squeezed more seats into the same space, lowering ticket prices. Once luxurious machines resembling first-class rail cars in their accommodations, airliners increasingly mimicked buses. This change was typified by the Boeing 747, the largest airliner available in 1970, which was so large it had two decks.

Social Impact

In 1927 Charles Lindbergh flew from New York to Paris, claiming the Orteig Prize offered for the first nonstop flight between the two cities. Lindbergh's impact was far from simple record setting: his success convinced many that aviation was more than a lark. One measure of his impact was the jump in air passengers in the years immediately following his flight. Insignificant in numbers before Lindbergh flew the Atlantic, airline passengers in the United States surged from 12,594 in 1927 to 52,934 in 1928. By the end of the twentieth century, jet-powered airliners had become the mainstay of commercial service worldwide, capable of great

speeds (nearly 1,000 kilometers per hour in many instances) and range. These flying behemoths can ferry five hundred passengers at once from place to place, and their efficiency has had a dramatic effect on human mobility.

Despite economic crises, the threat of health pandemics and terrorism, and the occasional air disaster, every year countless people around the world fly thousands of miles in mere hours for both work and pleasure. In 2008, as many as 4.87 billion passengers took to the skies. Travel, once a luxury reserved for the wealthy who had the time and the money for a journey, is now accessible to an extraordinary swath of people. Almost no place on the planet is inaccessible, thanks to the airplane's ability to deliver anyone to any destination quickly. This much air travel can't help but have an impact on the environment; and in an era of heightened concern over carbon emissions and climate change, the air travel industry is having to consider and respond to these concerns.

Aztec Empire

The Aztec Empire of central Mexico dominated through imperial rule for nearly a hundred years as overlords took control of numerous city-states in the regions, gaining power and wealth. The vast and powerful empire attracted Spanish invaders seeking wealth and treasure. These invaders brought with them disease and advanced weaponry that eventually led to the defeat of the Aztecs and the fall of the empire.

The Aztec Empire dominated central Mexico from 1430 until its conquest by Spanish conquistadors in 1521. At its height it ranged from the Gulf coast to the Pacific, and from nearly 160 kilometers north of Mexico City to the present-day Guatemalan border. It encompassed high plateaus, broad and narrow valleys, daunting mountain ranges, and verdant tropical forests.

Antecedents

As the last great political force in Mesoamerica, the Aztecs drew on the experience and accomplishments of a succession of earlier civilizations. In central Mexico, the monumental city of Teotihuacan flourished from 150 CE until approximately 750. This city established strong regional control in addition to conquering more distant areas, and it engaged in trade with and exercised political influence over polities as distant as those of the Maya in the lowlands of present-day Guatemala. Later, from 950 until around 1150, the city of Tula (in present-day Hidalgo), a major regional center of the Toltec people, gained prominence; it was closely tied to the

city of Chichén Itzá in northern Yucatán. However, Tula does not appear to have developed an empire in the manner of the earlier Teotihuacanos or the later Aztecs.

The Aztecs drew on much of the Teotihuacan experience in developing their own empire: their capital city of Tenochtitlán was laid out on a grid plan (as was Teotihuacan), they engaged in human sacrifice at a state level, they conquered far-flung territories in creating an empire, and they gave prominence in their godly pantheon to the deities Quetzalcoatl and Tlaloc, both of whom appear in somewhat different form at Teotihuacan. From Tula and the Toltecs the Aztecs appear to have gained their understanding of

Teotihuacan, the ancient “City of the Gods” during the Aztec Empire. Tourists stroll down the Avenue of the Dead past the Pyramid of the Sun, left. Photo by Arturo Delfin, (www.morguefile.com).

power politics, and they based their legitimacy to rule on a Toltec foundation. The Aztecs also venerated the achievements of the Toltecs at a nearly mythical level, attributing to the Toltecs all of the fine arts and cultural achievements (such as the calendar and writing) that the Aztecs themselves enjoyed. Aztec appreciation of their predecessors is clear not only from these emulations, but also from their inclusion of images of Teotihuacan, and the presence of other “antiquities” as offerings in buried caches in the Templo Mayor district of Tenochtitlán.

The Basis of Empire

The Basin of Mexico served as the seat of power for the Aztec Empire. This lake-dominated valley had been a popular settlement choice for a long succession

of sedentary peoples, and indeed Teotihuacan is located in its northern region. Beginning around 1200, several hunting and gathering groups moved south into more fertile regions from the dry northern deserts. Leaving their original homeland of Aztlan (as yet unidentified), seven of these groups stopped at Chicomoztoc, or Seven Caves, and undetermined location in present-day northern Mexico. While historical accounts offer varying ethnic identifications, these groups moved south and settled in key locations around the Basin of Mexico and in valleys to the east, south, and west. These included the Acolhua, who established themselves east of Lake Texcoco; the Tepaneca, who settled to the west of the lake; the Xochimilca and Chalca, who took up residence in the south of the basin, and the Matlatzinca, Tlahuica, and Huexotzinca, who settled in neighboring valleys. In

each case, the people and their cultures blended with the resident sedentary populations.

The last to arrive were the Mexica who, after a dramatic arrival and turbulent relationships with resident polities, established themselves on a small island in Lake Texcoco in 1325. They named their city Tenochtitlán; it was to become an enormous metropolis and center of the Aztec Empire.

From 1325 until 1428 the Mexica pursued long-standing and widely accepted strategies on their road to ultimate imperial dominance. Renowned warriors, they served as mercenaries to the most powerful polity in the Basin of Mexico, Azcapotzalco (flourished c. 1300–1428). Their successes on the battlefield earned them lands, tributaries, and wealth, which they used to enhance their resource-poor island settlement. They concentrated on building and expanding their urban center beyond its small island setting and into the lake itself by claiming lands from the shallow lake bed. Ultimately (by 1519) the city would house 200,000 to 250,000 people. During this early period they also negotiated strategic elite marriages, particularly with the Colhuacan dynasty in the southern part of the basin. The Colhua claimed descent from the Toltecs, and establishing genealogical ties to that heritage gave the Mexica an enhanced power base and legitimacy to rule. With this dynastic connection forged, subsequent Mexica rulers successfully sought favorable marriage ties with other dynasties in the Basin of Mexico. In short, their first century in the basin provided the Mexica with the military, political, social, and economic foundation for their second century of imperial dominance.

The Growth of Empire

In 1428 the elderly ruler of the powerful city-state of Azcapotzalco died. The

Mexica and their neighbors, the Acolhua of Texcoco, took advantage of the ensuing internal power struggle, conquering that ancient seat of power. In the course of that war, the Mexica and Acolhua also joined with the Tepaneca of Tlacopan on the western shore of Lake Texcoco. These three major city-states joined to form a tripartite alliance, commonly known today as the Aztec Empire or the Triple Alliance (the name Aztec means “People of Aztlan,” although this term did not enter common usage (in scholarship, but not as a term the people used in reference to themselves) until well after the Spanish conquest. Scholars often use it today to refer generally to Nahuatl-speaking peoples in and around the Basin of Mexico in late post-Classic times). The people often referred to themselves as Mexica, Acolhua, Xochimilca, Chalca, and so forth, based on their city-state and ethnic affiliations. The Mexica under Itzcoatl (reigned 1426–1440) and the Acolhua under Nezahualcoyotl (reigned 1418–1472) took the initiative in the alliance’s expansionistic enterprises.

After consolidating their new political position in 1430, the Triple Alliance forces began an aggressive program of military conquest within the Basin of Mexico. The city-states they conquered were obligated to provide tribute to their conquerors on a regular basis, but they were also given opportunities to participate in and reap rewards from Triple Alliance conquests in more distant realms. The Triple Alliance rulers also forged alliances with these tributary city-states, solidifying their dominance through politically inspired marriages. The practice of polygamy among nobles favored this strategy, allowing a ruler to marry several women simultaneously and therefore establish numerous alliances in this fashion. Nonetheless,

the conquests and alliances were not necessarily easy: for instance, Chalco, in the southeast corner of the Basin of Mexico, waged on-and-off war with the Triple Alliance powers for some three additional decades, finally succumbing to Aztec military might in either 1453 or 1465.

Even before the conquest of Chalco was concluded, the Mexica and their allies were already making military advances on city-states beyond the Basin of Mexico. The Mexica king Motecuhzoma Ilhuicamina (Motecuhzoma the Elder; commonly known in English as Montezuma I; reigned 1440–1468) spent his first decade of rule further consolidating conquests in the Basin of Mexico. Then he and subsequent Mexica rulers Axayacatl (reigned 1468–1481), Tizoc (reigned 1481–1486), Ahuitzotl (reigned 1486–1502), and Motecuhzoma Xocoyotzin (Motecuhzoma the Younger, or Montezuma II; reigned 1502–1520), along with the tenacious Nezahualcoyotl and his son Nezahualpilli (reigned 1472–1515) of Texcoco (who together reigned from 1418 until 1515) led the Triple Alliance to military conquests beyond the basin to ultimately bring much of central and southern Mexico into their imperial net. In these conquests, Tlacopan remained the lesser partner.

This progression of imperial expansion was not without its setbacks. Provinces sometimes rebelled against their overlords, and reconquest campaigns had to be mounted. The Mexica ruler Motecuhzoma Xocoyotzin spent a great deal of military energy simply reasserting imperial power over previously conquered city-states. Indeed, the empire may have come close to its maximum territorial extent by the time the Spaniards arrived in 1519. To the north lay deserts and areas relatively unattractive for conquest, to the east lay the Gulf of Mexico, and to the west sat the powerful Tarascans. To the south lay the rich regions of the Mayan city-states. Their considerable distance from the Basin of Mexico may have been a deterrent to Aztec conquest, since all travel and transport was by foot or canoe. Access to the precious Mayan resources was effectively obtained through the energetic commercial activities of professional merchants, some of them engaged by the Aztec state.

The Aztecs were not invincible. A major war between the Aztecs and Tarascans in 1478 or 1479 resulted in a devastating defeat for the Aztec forces, and the Triple Alliance avoided engaging the Tarascans in a major war again. There were also pockets of unconquered city-states within the imperial bounds. Most notable among these were the Tlaxcallans to the east of the Basin of Mexico, who, although surrounded by the Triple Alliance Empire, remained independent of the Aztec yoke. In 1519 they became decisive allies to the Spanish conquistadors in their conquest of Tenochtitlán.

Further serious problems beset the empire during its short ninety-one-year history. For instance, from 1450 to 1454 a calamitous famine wracked central Mexico, to the extent that thousands of people perished and some that survived exchanged their freedom for maize with the Totonacs of the Gulf coastal region. And in 1503 a devastating flood consumed much of Tenochtitlán, necessitating an energetic rebuilding program.

Structure and Strategies of the Aztec Empire

The primary goal of imperial rule was the acquisition of tribute paid on a regular basis to the Triple Alliance overlords. Upon conquest, a subdued city-state would agree to scheduled payments of locally available goods and products such as maize, chilies, honey, raw cotton, clothing, wood products, incense, warriors' costumes and shields, greenstones, gold, feathers and jaguar skins. As long as these demands were met and the city-state did not rebel, the imperial powers took little interest in the affairs of their subjects. Politically, local rulers were usually allowed to remain in their traditional positions. The most prominent and insistent Aztec presence in conquered areas was in the form of imperial tribute collectors. Only occasionally, in recalcitrant areas, were Aztec officials such as governors installed or military garrisons stationed.

This loose structure disguised a well-considered system of political organization. In the core area of

the empire (the Basin of Mexico), the Aztec Empire had the most time to integrate conquered city-states into its political and economic net. They pursued dynastic marriages with local rulers, then installed the offspring of these royal marriages in the conquered city-state: the new ruler therefore combined local legitimacy with imperial loyalties. In some cases new administrative offices were created, and in a few instances local rulers were actually replaced by those selected by the imperial powers. More subtly, city-states of the basin were often required (or invited) to participate in military ventures as the Triple Alliance advanced to conquer far-flung polities. If successful, warriors of these subjugated city-states could gain gifts and titles as rewards, thus heightening their interest in remaining part of the empire. They were not only attached to the empire, they had become participants in it.

More distant conquered areas saw fewer advantages to their conquest. It was usual that many of the conquered warriors were taken to the Aztec capital cities for sacrifice immediately following conquest. The demands of tribute were unrelenting, and if an Aztec army on the march passed through, the local population could be drained of its subsistence resources to supply the military.

The Triple Alliance employed well-considered strategies in establishing and maintaining its imperial control in outlying areas. An economic strategy focused on the city-states (administratively grouped into provinces) that paid regularly scheduled tribute to the Aztecs. Beyond the Basin of Mexico, this totaled thirty-two provinces that provided much economic support for the rulers and people of the Triple Alliance capitals: maize and other foodstuffs were stored against possible famine; warfare paraphernalia was held for military use; specific goods were stored and distributed as gifts, commissions, or for foreign trading enterprises; the enormous imperial bureaucracy and expensive priestly activities were supported; raw materials were fashioned by urban artisans into luxury wares for the nobility; and in general the extravagant lifestyle of imperial royalty and palatial life was enhanced. The imperial powers maintained this

continual flow of tribute goods through threats of reprisals, usually entailing reconquest and a doubling of tribute demands on a rebellious province. As the empire continued expanding, an additional strategy became useful. This was a frontier strategy, and entailed the establishment of client states along hostile borderlands, astride critical transportation routes, or near critical but contested resources. In place of an outright military conquest, the Aztecs negotiated mutually beneficial agreements with these city-states, cemented with gifts. Client states served the empire by assuring borderland control, open transportation routes for merchants and troops, and access to critical resources. In this strategy, the Aztecs found an inexpensive way of managing their distant affairs. Nonetheless, they did establish fortresses and station garrisons at specific military hot spots, whether along volatile borders or within defiant provinces.

Fall of the Aztec Empire

In early 1519 a small force of Spanish conquistadors landed on the Mexican mainland. They had learned of the large empire led by Motecuhzoma and of his vast wealth; tales of treasures of gold were of special interest to the Spaniards. Under the leadership of Hernán Cortés, they traveled inland with the intent of conquering this rich land. A number of factors contributed to the ultimate Spanish victory. Spanish weaponry had some small advantage, with muskets, cannons, and especially steel swords. Horses provided mobility and height in battle, and ferocious dogs sparked considerable fear in the hearts of the native warriors (the small native domesticated dogs, commonly used as food, were of a different genre entirely from the large European canines). In the heat of battle, a major goal of native (but not Spanish) combat was the capture of the enemy for sacrifice, resulting in valorous risks and high indigenous casualties. Most important was the tenuous hold the Aztecs had on their conquered and client city-states, and the presence of significant unconquered polities. Cortés took early advantage of this loose organization to convince many of these city-states,

and especially the powerful Tlaxcallans, to join him in his goals of conquest; in the end, the small force of Spaniards was massively augmented by native warriors. The seeds of destruction were built into the Aztec imperial structure. Cortés's siege tactics employed late in the conquest took a final toll on a starving Tenochtitlán devoid of allies and wracked with smallpox, a disease that arrived with the Europeans and to which the local population had no immunity. Motecuhzoma had perished and his successor Cuitlahuac fell to the disease during the siege. On 13 August 1521 the last Aztec ruler, Cuauhtemoc, was captured by the Spanish conquistadors, signaling the end of Aztec imperial dominance in Mesoamerica.

Babylon

Babylon was an important city-state of ancient Mesopotamia. Its remains can be found just south of Baghdad in present-day Iraq. Founded as a relatively small town around the beginning of the third millennium BCE, Babylon has been at the center of the rise and fall of a number of important dynasties and empires, including the Amorite, Hittite, Kassite, and Assyrian.

At its height, Babylon was one of the largest, most important cities of the ancient world. It was located in central Mesopotamia, near the point where the Tigris and Euphrates flow closest to one another. This same region has been home to many capital cities over the centuries: Kish, Agade, Seleucia, and Baghdad among them.

The city's ancient name, Babil, may well be in an unknown language that predates Sumerian and Akkadian in Mesopotamia. It came to be understood in Akkadian as *bab-ili*, meaning “gate of the god,” also written in Sumerian as *ka-dingir-ra*, which has the same meaning. *Babylon* is the Greek version of the name. Today we refer to the southern half of ancient Mesopotamia—the region extending from around Babylon south to the Persian Gulf—as Babylonia, but in ancient times this land was called Sumer and Akkad.

The city of Babylon was well known to Greek and Roman historians. The Greek historian Herodotus, who may have visited the city in the fifth century BCE (or based his account on the reports of eyewitnesses), wrote that “it surpasses in splendor any city of the known world” (Herodotus 1972, 185). Classical authors also credited Babylon with one of the ancient wonders of the world: the Hanging Gardens of Babylon.

An artist's reconstruction of the fabled Hanging Gardens of Babylon, with its tree-lined terraces and the surrounding canal. From *Wonders of the Past*, Sir John Alexander Hammerton (Ed.), published c. 1923–1933.

Babylon is mentioned frequently in the Bible. The Tower of Babel was certainly thought to have been located there; Babylon was the place to which Nebuchadnezzar II (reigned 605–562 BCE) exiled the Jews after the conquest of Judah; and the city was said to be home to Daniel. Therefore, unlike most other cities of the region, Babylon was not forgotten after its demise.

Babylonians exhibit mixed reactions to the Persian emperor Cyrus's invasion in 539 BCE. From *Story of the Greatest Nations: From the Dawn of History to the Present*, by Edward Sylvester Ellis, published c. 1901–1906.

Long after the buildings had disintegrated, the northernmost mound of the site even retained the name Tell Babil. What was forgotten, however, was the long history of the city before the period of Nebuchadnezzar.

Unfortunately, the underground water table at Babylon rose over the centuries, so even archaeologists have had difficulty fathoming the earlier history of the city. The occupation levels from the third and second millennia BCE are largely waterlogged. It is possible that, like the Assyrian city of Nineveh, the site was occupied long before written history, but there is no way to know. What we do know about Babylon before the first millennium BCE comes largely from textual records from other ancient cities.

The earliest known mention of the city of Babylon comes from the time of Sharkalisharri (reigned c. 2217–c. 2193 BCE), a king of Akkad and descendant of the empire-builder Sargon (reigned c. 2334–2279 BCE). The inscription mentions two temples in the city, but little else is known from this early time.

First Dynasty of Babylon

At the beginning of the nineteenth century BCE, the history of Babylon comes into sharper focus. Around

2000 BCE the native Sumerian and Akkadian peoples of Mesopotamia had been subject to an invasion of Amorites, “westerners” who had settled in the river valley and largely adopted local customs. Amorite, like Akkadian, was a Semitic language, but its speakers did not write it down. They continued to use Akkadian and Sumerian in written documents.

Amorite kings took control of several Mesopotamian cities, Babylon among them. Over the next century, the Amorite dynasty of Babylon, founded by Sumu-Abum (reigned 1894–1880 BCE), consolidated its control over the surrounding lands. By the early eighteenth century BCE, a dozen kingdoms, including Babylon, dominated Mesopotamia and Syria, some bound together by alliances, others often at war.

Hammurabi (reigned 1792–1750 BCE) is considered to be the greatest of the kings of the first dynasty of Babylon (also called the Old Babylonian period). From the beginning of his reign he emphasized that he was a king who was concerned with justice. It was traditional at that time to refer to years by names rather than numbers, and Hammurabi’s second year name shows his concern for justice: “The year that Hammurabi established equity and freedom in his

If a man put out the eye of another man, his eye shall be put out.

• **Hammurabi** (eighteenth century BCE)

land” (Horsnell 1999, 2:106). But it was not until very late in his reign that Hammurabi decreed the set of laws for which he has become best known. By that time he had brought much of Mesopotamia under his rule, from Mari in Syria (just north of modern Iraqi border) to the Persian Gulf.

Although Hammurabi was not the first lawgiver (written laws had existed in Mesopotamia for more than two hundred years when he came to the throne), his laws made a strong impression on subsequent generations of Mesopotamian scribes, who copied and studied them for centuries. His laws also had an influence on surrounding peoples such as the Hittites and Canaanites, and eventually on the Israelites and therefore on Biblical law.

Hammurabi venerated many gods, rebuilding their temples and presenting them with thrones and gifts, but he credited his successes mostly to the city god of Babylon, Marduk. The god’s statue was housed in a great temple in the center of the city. Marduk’s cult was an essential part of Mesopotamian religion from this time on.

Hittites and Kassites

Around 1595 BCE, the Hittites (a people from present-day Turkey and northern Syria) seem to have sacked Babylon and taken many Babylonians captive. They also captured the statues of Marduk and his wife Sarpanitum and took them back to their own land of Hatti, where the statues stayed for decades. Unfortunately, this event is poorly understood. It is almost unknown in Babylonian records and mentioned only briefly in Hittite records. No archaeological evidence exists because of the problems with excavating early levels at Babylon. But it is clear that the Hittites did not stay or attempt to rule Babylon.

The century after the conquest of Babylon remains something of a mystery, due to an almost complete lack of textual sources and little archaeological evidence, but by 1500 BCE a new foreign dynasty had taken control of Babylon: the Kassites. Their origin is unclear, their language known only from the evidence of their personal names. Like the Amorites, they adopted

Babylonian ways, and they proved to be adept rulers. Mesopotamia was united and relatively peaceful during the centuries of Kassite rule. The Kassite kings of Babylon communicated regularly with the Hittite kings in Anatolia, the Syrian kings in Mittani, and the New Kingdom pharaohs of Egypt. Their correspondence, found in Egypt and Anatolia, shows that the Babylonian kings sent the Egyptian kings gifts of horses and lapis lazuli, in exchange for which they always wanted gold. They also wrote extensively about the marriage alliances that were set up between them. Several Babylonian princesses became queens of Egypt.

By the thirteenth century BCE, a new power began to assert itself to the north of Babylon: Assyria. From this time onwards, Babylonia and Assyria became the chief powers and rivals in Mesopotamia. Although the region suffered a decline during the twelfth and eleventh centuries BCE, during which time the Kassite dynasty collapsed, the division of the land into two halves continued.

Babylon during the Assyrian Empire

During the time of weakness that marked the end of the Kassite period, yet another foreign people from the west, the Arameans, entered the land in large numbers, sometimes as immigrants, sometimes as invaders. But whereas the languages of the Amorites and Kassites seem to have been lost over time, the Semitic language of these new arrivals, Aramaic, began to replace the ancient language of Akkadian as the spoken tongue of the Mesopotamian people. Aramaic was widely used in both Babylonia and Assyria, even though for centuries Akkadian remained the standard written language. Aramaic was to be the predominant language in the region until the spread of Arabic over 1,500 years later in the seventh century CE.

Between the end of the Kassite dynasty and the eighth century BCE, six local dynasties ruled Babylon, none of them able to achieve the type of power that had been characteristic of Hammurabi’s dynasty or of the Kassite kings. They were sometimes on good terms with the Assyrians, but at other times

they were hostile, especially as Assyria became more and more powerful.

The Assyrians seem always to have respected Babylonian culture and venerated Babylonian gods. Their powerful emperors generally treated the Babylonians with much more generosity than they did their other neighbors. But still, warfare often broke out between the two lands, with several Neo-Assyrian kings claiming direct control over Babylonia or placing puppet kings on its throne.

In the eighth century BCE a fourth major group of settlers and invaders appeared in Babylon. These were the Chaldeans, who came from the marshes in the south. Although they seem to have spoken the same Akkadian language as the local Babylonians, they were regarded as the enemies of the Babylonians for many years. Eventually, though, the Chaldeans, like the Kassites and Amorites before them, became rulers of Babylonia.

The Neo-Babylonian Period

The second great period of Babylonian dominance, the Neo-Babylonian period, came a thousand years after Hammurabi's empire collapsed. The Babylonians, collaborating with the Medes, overthrew the Assyrian Empire in 612 BCE and took over control of much of the region. The dominant figure from this time was the Chaldean king of Babylon, Nebuchadnezzar II, who was both a conqueror and a prolific builder.

It is the Babylon of his reign that is the best known—a city of unprecedented size and grandeur. This is the city that was described by Herodotus and the one that has been excavated and partially reconstructed. The immense city walls were 18 kilometers long, with at least eight monumental gateways, and they surrounded an area of 850 hectares. Inside the city, the ziggurat (stepped tower) of the temple to Marduk, the Esagila, was built up to great height, visible from far and wide. It is believed to have been the inspiration for the Bible's story of the Tower of Babel. Unfortunately, it was completely dismantled in ancient times, so no one can reliably determine how tall the tower actually stood.

Everywhere, construction was of baked brick, not the usual sun-dried brick that had dominated Mesopotamian architecture for millennia. Whole regions of the city, such as the processional way leading to the Ishtar Gate, were faced with glazed bricks in a vivid blue, decorated with images of lions and dragons sculpted in relief and glazed in bright shades of yellow, black, and white.

Archaeologists have found no clear evidence for the famous Hanging Gardens, which are described in classical sources as terraced gardens on an artificial structure—a “wonder” because of the technology it would take to grow trees on top of a building. Nor did any contemporary source mention the gardens. Herodotus does not even mention them in his otherwise detailed description of Babylon. It has recently been suggested that these gardens were not, in fact, in Babylon, but were located in Assyria. The Assyrian king Sennacherib (reigned 704–681 BCE) boasted of creating just such a terraced garden, watered by an aqueduct, in his capital city of Nineveh.

The Neo-Babylonian period proved to be short-lived, lasting less than a century. The last of the Babylonian kings was an elderly, eccentric man named Nabonidus (reigned 555–539 BCE) who neglected the annual festival in honor of Marduk and who was deeply devoted to the moon god. The Babylonian population seems to have disliked him so much that they put up little resistance to the Persian emperor Cyrus II (c. 585–c. 529 BCE) when the latter invaded in 539 BCE.

Persian and Hellenistic Periods

Initially, under Cyrus and his successors on the throne of Persia, life in Babylon was relatively unchanged. Cuneiform documents that recorded the business transactions of Babylonian merchants and entrepreneurs show that Babylon was still a rich city. The kings of Persia spent their winters in Babylon and seem to have been well disposed to the place. This was true, at least, until the reign of Xerxes I (reigned 486–465 BCE). Xerxes was infuriated by a rebellion mounted by the Babylonians, and he took out his anger on the beautiful buildings of Nebuchadnezzar,

even destroying the temple to Marduk. It is unclear whether the temple was ever properly rebuilt after that time. Xerxes imposed crushing taxes on the Babylonians once he had brought the rebellion under control.

When Alexander the Great (reigned 336–323 BCE) took over the Persian Empire in 330 BCE, he seems to have fallen under Babylon's spell. He thought that it would be one of his capital cities and had grand plans to rebuild the ziggurat of Marduk's temple. His workmen did succeed in dismantling the ruins of the earlier ziggurat, but a new one probably was not constructed before Alexander's death. The Macedonian king died in Babylon on 13 June 323 BCE, perhaps of malaria or alcohol poisoning.

Alexander's successor in Mesopotamia, the general Seleucus (reigned in Babylon 312–281 BCE), was less fond of Babylon. He built a rival city just 90 kilometers to the north and called it Seleucia; it became the Royal City in 275 BCE. Gradually trade and business activity began to move to Seleucia, making Babylon less relevant to the local or imperial economy. An edict issued by Antiochus I (281–261 BCE) required all Babylonian residents to move to Seleucia. It is clear, however, that they did not all obey, because Babylon continued to be occupied, though it was much less important than it had been. By the first century BCE, just a few buildings were left standing in Babylon, surrounded by the still-impressive city wall. The grand avenues that had once been flanked by tall buildings were gone, turned into grazing grounds for sheep and goats.

The Present

Since the Mongol invasion and conquest of Iraq, first in 1258 by Hulagu, grandson of Chinggis (Genghis) Khan, and then again in 1401 by the Turkic warrior Tamerlane (Timur), the region and its antiquities have suffered considerably. In the late nineteenth century a German team of researchers began to excavate at sites in Babylon. They dug up large areas of the Neo-Babylonian city and transported much of the Ishtar Gate to Berlin, where it can still be seen in the Pergamon Museum. Excavations

then continued under Iraqi leadership. In the late twentieth century, Saddam Hussein (1937–2006; president of Iraq 1979–2003), who saw himself as a modern-day Nebuchadnezzar or Hammurabi, had the Iraqi Antiquities Administration restore the ruins of Babylon to a semblance of their former glory. Like Nebuchadnezzar, his name was inscribed on many of the bricks used in the reconstruction. The result was a fascinating place to visit, though archaeologists lament the fact that many of the real archaeological ruins have been covered up by the modern reconstructed walls. Further damages and loss of antiquities have resulted from the United States–led war in Iraq beginning in 2003. In the early days of the war the National Museum of Iraq in Baghdad, home to thousands of manuscripts and relics from across Mesopotamian civilization, was looted. As of late 2009, less than half of the stolen items had been recovered. The U.S. military also attracted criticism for building a military base, including a helipad, on the site of ancient Babylonian ruins, causing damage to important archeological sites, including the replica Ishtar Gate. While Iraq in 2010 is far from being a popular tourist destination, it is possible that in the future visitors from around the world will be drawn again to Babylon to see the remains of what was one of the world's greatest cities.

Bahá'í

Founded by Baha'u'llah in the nineteenth century, the Bahá'í faith is a monotheistic religion that grew out of Islam. It recognizes Muhammad as a prophet, but not the last prophet. At the core of Bahá'í faith is the belief that all of humanity is spiritually unified and that Bahá'í will guide civilization toward an age of peace and prosperity.

The Bahá'í religion was founded and initially propagated toward the middle of the nineteenth century in the (then) Ottoman regions of Iraq, Turkey, and Palestine by a Persian-born messianic claimant named Mirza Hoseyn Ali Nuri (1817–1892), who adopted the title Baha'u'llah (Baha' Allah), meaning the “Splendor of God.” Ranging across more than two hundred counties, his followers today number 5–6 million and are known as Bahá'ís (literally “radiant ones”). Given their range throughout the world, the modern Bahá'í religion can no longer be viewed as a purely Middle Eastern movement, an Islamic “sect,” or a merely eclectic religious phenomenon.

Baha'u'llah was born a Shi'ite Muslim in a troubled Persian Islamic society. He called all humankind to a revolutionary and modernist post-Islamic religion, initially that of his predecessor the Bab (literally the “Gate”) and subsequently to the Bahá'í religion, which he founded. To some, his message transcended and superseded Islamic legal and other religious norms as the new Bahá'í religion, not only for the contemporary world but also for times extending a millennium or more into the future. The developed Bahá'í religion is centered upon actualizing a spiritual unity in diversity of all humankind

in a future world characterized by millennial justice and peace. Religion and science, Baha'u'llah and his successors indicated, should both harmoniously contribute to an advancing civilization in which racism, excessive nationalism, and materialistic capitalism are transcended.

The Religion of the Bab

Baha'u'llah became a follower of another young Persian messianic claimant, Mirza 'Ali Mohammad (1819/ 1820–1850), the Bab, at the outset of his religious mission in May 1844. He considered the Bab to be his divinely inspired forerunner. The Bab gradually established his own post-Islamic religious system and revealed new books in Arabic and Persian collectively known as the Bayan (Exposition). He was imprisoned for much of his six-year religious ministry, which ended with his execution for heresy in 1850. Several thousand of his followers were also martyred for apostasy and heresy. Though best known today as the Bab (gate to the messiah), this Persian Sayyid (descendant of Muhammad) actually claimed to be the awaited Islamic eschatological savior, the Qa'im (Ariser) or Mahdi (Rightly Guided One). He also subsequently claimed to be a divine “Manifestation of God” and underlined the eternally progressive continuity of religion, thereby transcending the Muslim concept of the finality of prophethood in Muhammad (Qur'an 33:40).

With his many revelations, the Bab claimed to disclose the deeper senses of the Qur'an and of pre-Islamic scripture, and to prepare the way for another messianic individual greater than himself. In claiming to supersede Islam, the

Modern-day view of the tomb of the Bab, who is considered the divinely inspired predecessor of Baha'u'llah. Mount Carmel, Israel.

Bab also spoke of endless future messiahs. These superhuman, divine figures were actually preexistent and theophanic manifestations of

God, the next of whom might appear imminently or perhaps, for example, after 9, 19, 1,511, or 2,001 years.

In the Bahá'í religion the greatest name for god, Bahá', means "glory" or "splendor." The photo shows the name as it appears inside the Bahá'í House of Worship in Wilmette, Illinois. Photo by Sean M. Scully.

Bahá'u'llah and Religion Renewed

Bahá'u'llah followed and propagated the religion of the Bab from its inception in 1844 until the latter years of his exile from Iran to Iraq (1852–1863), when he began to gradually declare his own global mission. On announcing his mission on the outskirts of Baghdad in 1863, he outlawed the propagation of religion by the sword, indicated that his religion would continue for at least a millennium, and voiced doctrines indicative of the equality and oneness of all humanity.

Like the Bab, Bahá'u'llah composed thousands of scriptural "tablets" in Arabic and Persian over a forty-year period (1852–1892). These 20,000 or so revelations vary in length from a few lines to weighty books and treatises such as his *Kitab-i iqan* (Book

of Certitude, 1852), *Kitab-i badi'* (Innovative Book, 1867), and his major though slim book of laws, *al-Kitab al-Aqdas* (The Most Holy Book, 1873). Like his forerunner, he placed great emphasis upon the nonliteral interpretation of the Bible and the Quran and often gave figurative interpretations to messianic signs and latter-day prophecies. Apocalyptic upheavals and catastrophes, he explained, had been realized or would come to be fulfilled either literally or spiritually. Hopes of a new age and of the millennial future of humanity would, he predicted, definitely come to realization in a future Bahá'í-inspired new world order.

Despite being exiled and imprisoned for religious heresy for several decades of his life by Persian and Ottoman leaders, Bahá'u'llah continued to address weighty and theologically authoritative epistles to various kings, rulers, and ecclesiastics of his day.

Among those he called to God and to righteous rule were the British queen Victoria (1819–1901), the French emperor Louis-Napoleon (Napoleon III; 1808–1873), the Russian czar Nicholas II (1868–1918), and the Italian pope, Giovanni Maria Mastai-Ferretti, Pope Pius IX (1792–1878).

It was clear from his *Kitab-i 'Ahdi* (Book of My Covenant) that on Baha'u'llah's passing in Palestine in 1892, his saintly and learned eldest son 'Abd ol-Baha' (1844–1921) would succeed him. His son wrote several books and many thousands of letters expounding his father's message and visited several western countries between 1911 and the outbreak of World War I in 1914. "The Master," as 'Abd ol-Baha' was respectfully known, was in turn succeeded in 1921 by an Oxford-educated great-grandson of Baha'u'llah named Shoghi Effendi Rabbani (1896–1957), the last single head or Guardian of the Bahá'í religion. In 1963, the globally elected Universal House of Justice came to direct and govern the Bahá'í world from its center in Haifa, Israel.

Baha'u'llah's oft-repeated statement that the Earth is but one country and all humankind are its citizens continues to underpin many activities of the Bahá'í faith today. Its adherents claim that its promotion of the spiritual dimensions of the oneness of humanity, the equality of the sexes, international justice, and world peace makes the Bahá'í religion a channel for the realization of a twenty-first-century religiosity that transcends contemporary secularism and exclusivism. The faith's continuing championing of a globally selected or newly-devised universal auxiliary language and its close relationship with the United Nations since the inception of the latter in 1945 in working towards a peaceful global society are proclaimed as some of the major contributions which the Bahá'í international community has made to world history. Under the direction of the Universal House of Justice, the Bahá'í International Community has consultative status with UN organizations including United Nations Economic and Social Council, United Nations Children's Fund,

World Health Organization, United Nations Development Fund for Women, and the United Nations Environment Program.

In recent years, the Bahá'í international authority known as the Universal House of Justice has issued a statement entitled "The Promise of World Peace" (1985) addressed to the peoples of the world and another called "To the World's Religious Leaders" (2002) containing advice for the evolution towards a united humanity.

Bands, Tribes, Chiefdoms, and States

The cultural anthropologist Elman Service devised a model in 1962 for classifying human societies into four general categories—bands, tribes, chiefdoms, and states—based on their capacity to support larger populations at higher densities. Societies are said to vary in complexity from bands, loosely organized groups of a few dozen people, to states, highly centralized and efficient societies comprised of millions, even billions, of people.

The differences among human societies around the world and through time are often striking and often challenge our understanding. Although a simple distinction between “primitive” societies and “civilization” has been popular and persistent in the West, this distinction obscures significant variation within the “primitive” category and has not been useful for investigating the processes that led to the development of civilization. When addressing such issues, anthropology has found that a model recognizing four levels of sociopolitical complexity—band, tribe, chiefdom, and state—has greater utility. These levels are based on cross-cultural ethnographic (relating to the study of cultures) data as well as archaeological evidence from both prehistoric and historic periods.

In this context complexity is seen as society’s ability to integrate people into larger, more diverse groups and more densely populated communities. This ability is closely linked to political integration in the form of increasingly centralized decision making and hierarchical power relations and economic integration by which individuals and communities become less self-sufficient and more dependent on others for critical resources, including food. The classic

model was first proposed by the U.S. anthropologist Elman Service (1915–1996) in 1962 and, with minor modifications, is still widely used by anthropologists and archaeologists as a generalized descriptive framework.

Bands

Bands are the smallest and least sociopolitically complex human groups. A band usually consists of related families who camp together and collaborate closely, rarely numbering more than one hundred people and frequently closer to one dozen or two dozen. Most bands are hunters and gatherers or foragers who do not use domesticated plants or animals for food. In order to exploit the wild foods available in their environments most efficiently, many bands are nomadic, moving within a large, vaguely defined territory to take advantage of seasonal bounties and allow declining resources time to recover. This strategy is generally feasible only when population densities are very low, and bands usually have densities below one person per 2.5 square kilometers.

When so much space and so few people exist, centralized political control is difficult: people avoid socially aggressive or disagreeable people by moving elsewhere or joining another band. Consequently no formal offices of leadership exist, group decisions require consensus, and social relations are highly egalitarian; age, gender, and personal abilities are the primary determinants of social status. Some statuses—for example, those of shaman or healer, good hunter, good gatherer—are more valued, but these must be achieved by a person’s actions, and groups welcome as many talented people as they can

Bedouin tribesmen in the Middle East pose for a photo in 1914. Formed from several different kinship groups, their tribe functioned as a political organization.

attract. When coordination with other families or bands is necessary (during a communal hunt, for instance), such highly competent and respected people can become situational leaders. Their authority, however, ends when the situation does, and their attempts to dictate to others on unrelated points are not tolerated. When a more hierarchical society came into contact with such a group, the society expected to deal with a single “headman,” but—to the society’s frustration—this headman was not able to bind the whole group by its decisions and agreements.

Low levels of economic integration reinforce the difficulty of political control. Bands tend to use simple technologies by which every family can make all of the tools it needs to acquire the necessities of life. This material self-sufficiency encourages high levels of autonomy, and nomadism (as well as the lack of domestic animals to transport family possessions) discourages the accumulation of wealth. Economic relations are based almost entirely on the principle of reciprocity, the mutual exchange of food surpluses and symbolic, relationship-affirming gifts.

People often consider bands to be the original form of human society, the norm before the development of farming about 10,000 BCE. However, most bands inhabit marginally productive environments unsuitable for farming, and groups inhabiting more bountiful environments in the preagricultural past may have had more complex societies.

Tribes

In common usage the word *tribe* often refers to any “primitive” society, and so we hear of “tribal art” and “tribal warfare.” In Service’s model, however, *tribe* has a narrower, more specific meaning: a tribe consists of a number of small communities, often semi-autonomous bands or villages that consider themselves to be a collective unit. This unit usually numbers from hundreds to a few thousand people. Whereas some tribes are foragers, most practice horticulture (small-scale hoe or spade farming) or pastoralism (animal herding).

Tribes, like bands, have generally egalitarian social relations and informal leadership. The feature that

distinguishes tribes from bands is the stronger sense of connection between a tribe’s constituent communities, as opposed to the more independent bands. Although these constituent communities retain significant levels of autonomy in day-to-day affairs, they come together in mutual support and act as one unit when under threat, which includes environmental stresses such as crop failure as well as competition from outsiders. This coordination is fostered by social groups who cross-cut the allied communities, creating and maintaining the interpersonal relationships that bind members of the tribe together. These allied communities can be kinship-based clans, age-grade divisions, and/or voluntary associations such as dance and curing societies.

In some more complex tribes, powerful people known as “Big Men” can emerge as local leaders. Like headmen, Big Men have achieved status and no formal authority; their elevated status comes principally from their skill at manipulating reciprocity relationships. By accumulating surpluses of food and symbolic wealth, they are in a position to make loans and give gifts to others and demand social and political support until they have been repaid. Their positions are rarely hereditary, however, and because several people usually are competing for the status at any given time, little centralization of political control is seen.

Why Become Complex?

In bands and tribes each family meets its own basic subsistence needs. At higher population densities, by contrast, more sophisticated and costly technologies are necessary to intensify food production, and increased competition for resources increases the need for mediation and resolution of social conflicts, both internal and external. To meet these needs in a larger society, a variety of full-time specialists exists: craftspeople, secular and religious leaders, and warriors. These specialists support the larger society with their skills and services, permitting it to become more efficient, and in return are supported by the surplus production that their services make possible.

Such specialization, however, creates fundamental differences in access to resources and power within

Death is the universal salt of states; blood is the base of all things—law and war.

• Philip James Bailey (1816–1902)

a society and provides the basis for hierarchical systems of social inequality. Although a perennial debate exists regarding the balance between the beneficial and exploitative facets of elite management of society (probably an unresolvable debate because that balance is different in each society and changes through time), experts broadly recognize the correlation between complex society and social inequality. As sometimes needs to be pointed out, states with egalitarian ideologies exist, but no egalitarian states exist. In fact, these internal sociopolitical divisions are precisely what make some societies more “complex” than others.

Chieftdoms

Chieftdoms have populations ranging from several thousand to hundreds of thousands of people. Although some chieftdoms may be supported by foraging in extremely rich environments, most rely on intensive agriculture or pastoralism, which provide the reliable food surpluses needed to maintain their comparatively small number of specialists. Scholars make a distinction between simple chieftdoms, which are smaller and have a single level of elites, and paramount chieftdoms, which have a hierarchy of chiefs and “chiefs over chiefs” who build larger polities (political organizations)—at the price of greater political instability as the different chiefly lineages compete for dominance.

Chieftdoms have social ranking by which high status is normally ascribed or inherited rather than achieved. Certain families or lineages retain possession of high-status positions, which are a small number of full-time offices with formally recognized duties and powers. Political power is centralized, to a greater or lesser extent, in the hands of the ruling chief, who has the authority to make decisions for the whole group and to use coercion to bring disruptive members in line. This authority is frequently legitimated by religion, by which the chiefly lineage has access to supernatural favor and power by virtue of divine ancestors whom “commoners” lack.

Chiefs also play an important role in the economic integration of their chieftdoms through redistribution, the collection—in the form of tribute or taxes—and

management of surplus production. This surplus production supplies the chiefly lineage with its subsistence base, but it is also given back to society in the form of support for religious and craft specialists attached to the chief’s household; feasting and gift giving that legitimate his position; funding for military action or the construction of aggrandizing monuments such as temples, palaces, or tombs; and the provision of survival rations in times of need.

States

Today every human being is part of a state. States, highly centralized and highly efficient polities, can integrate populations numbering from the hundreds of thousands to more than a billion. To maintain this level of intensification and control, states have sophisticated recording systems and rely on large numbers of specialists, who often congregate in cities. These cities—the word *city* coming from the Latin word *civitas*—and literacy are two of the hallmarks of “civilization.” Only intensive agriculture can provide the food surpluses needed to feed the dense populations of cities.

Whereas chieftdoms may have only two social levels (chiefs and commoners), states have at least three: the “upper class” of ruling elites; the “middle class” of bureaucratic managers and merchants, who are often literate; and the “lower class” productive base, including most craft specialists and agricultural laborers. Such social statuses are ascribed; the possibility of social mobility distinguishes class societies, where mobility is possible, although rarely easy, from caste societies, where opportunities for changing one’s social status can be virtually nonexistent. To maintain social order in their internally diverse, often multicultural, populations, states have formal legal codes and restrict the use of coercive force to their authorized agents. By assigning responsibility for conflict resolution to officers of the state rather than leaving it in the hands of private citizens, states minimize the disruption caused by kin-driven blood feuds and faction fighting that make large paramount chieftdoms so unstable.

States use redistribution to fund the state apparatus or government, but the dominant economic

mode in society is market exchange. This exchange allows the government to divest itself of the often-onerous responsibility for the distribution of resources throughout its territory by encouraging private citizens to move local surpluses to less-favored regions in hopes of profit. States encourage market exchange by recognizing standardized units of exchange, such as an official currency, and tap into the wealth generated by this exchange through taxation.

A World of States

Given their ability to amass substantial labor and commodity surpluses, states have an enormous competitive advantage over nonstate societies. History and archaeology amply illustrate this fact and document the trend through time toward a smaller number of larger sociopolitical units. In the study of state formation a term—*secondary states*—exists for societies that become states under the influence or pressure of neighboring states. This trend is not uniformly upward, however: numerous states have collapsed as the result of political and/or environmental instability. In these cases the affected populations restructured themselves at a lower level of sociopolitical complexity, often chiefdoms or tribes, that could be supported under the new conditions.

Nevertheless, this trend, which is widely but not unanimously seen as driven by population growth, has led to a dramatic loss of nonstate societies, especially during the last few centuries. Even in the mid-1900s, ethnographers could find and study autonomous bands, tribes, and chiefdoms. Now, at the dawn of the twenty-first century, these levels of sociopolitical complexity are essentially extinct. As bands, tribes, and chiefdoms cease to exist as functional units, some scholars see this model and its hierarchical rankings as an exercise in legitimating inequality and maintaining the marginalized status of “less-complex” groups. For those people involved in the study of social complexity, however, the model continues to provide

a utilitarian framework for understanding the social, economic, and political variation among societies.

Barter

The practice of swapping one good or service directly for another, without the use of money as an exchange medium, is known as barter. Because the relative value of one good against another varies with need, availability, and social context, barter transactions are not inherently simple, but often involve complex social relations.

Barter may be loosely defined as transactions involving the direct exchange of goods and services. It stands in contrast to exchanges facilitated by money, which enable the acts of buying and selling to be separated. The conception and use of barter very firmly reflect the society in which it is employed. The way in which barter is understood and carried out in a Pacific society, for example, where it might be linked to social rites that govern relations with neighboring islands, is different from the use of barter in communities today in the United States, in which neighbors might exchange food preserves for help with plumbing.

Characteristics of Barter

Trying to define barter with any precision is difficult. This is because barter transactions typically involve complex social relations (though a number of anthropologists have argued to the contrary, that barter is largely devoid of social ties). The social anthropologists Caroline Humphrey and Stephen Hugh-Jones, while recognizing that any attempt to provide a general definition or model of barter usually involves the loss of the crucial social context which conditions the act of barter, nevertheless suggest a number of characteristics.

Arab women sort through goods for barter at a market in the early twentieth century. Library of Congress.

Barter results from a demand for goods or services one does not already have. A man with a pig might want, for example, a canoe. The participants in the exchange are free and equal. Money, by which the value of the goods to be bartered might be measured, is not present; there is no independent means

On market day in Argos, Greece, circa 1901, young and old barter for the necessities of life.

of judging the value of the items to be bartered. The two parties must come to an agreement that the items to be exchanged are of equal value (a process in which bargaining is usually critical). Finally, the acts of buying and selling occur simultaneously, even though the completion of the transactions (delivering the goods, performing the service) may take some time.

Barter and the Study of the Economy

The traditional view of barter in European economics may be understood through the work of two men. The Greek philosopher Aristotle (384–322 BCE) provides the earliest surviving discussion of the role of barter in the development of exchange. His account (*Politics* Book I, chapter 9) is also important for its attempt to perceive the political and social implications of what might appear to be a simple economic process. The practice of exchange, he noted, did not exist in the earliest form of association—the household, which was self-sufficient—but arose when larger social groups developed and households began sharing things. The mutual need for different goods, he

claimed, was the essential reason for these exchanges. For Aristotle the original purpose of barter was to re-establish nature's own equilibrium of self-sufficiency. But it was out of this exchange, he warned, that money-making arose—a practice which he regarded with disdain as contrary to nature, in that it served no useful purpose but simply promoted the accumulation of more wealth.

In his 1776 book *The Wealth of Nations*, Adam Smith offered a more mechanical view of the function of barter. With the emergence of a division of labor, he argued, each man only produced a small part of the total range of goods he desired. They had to resort to barter, “which must frequently have been very much clogged and embarrassed in its operations” (Smith 1998, 32) for a person could not always find someone with the goods required that wished to barter for what was on offer. As Smith (1998, 32) explained it:

One man, we shall suppose, has more of a certain commodity than he himself has occasion for, while another has less....The butcher has more meat in his shop than he himself can consume, and the brewer and the baker would each of them be willing to purchase a part of it. But they have nothing to offer in exchange, except the different productions of their respective trades, and the butcher is already provided with all the bread and beer which he has immediate occasion for. No exchange can, in this case, be made between them.

In order to alleviate the inconvenience of barter, money was invented. Barter, for both Aristotle and Smith, is then constructed as a feature of economic activity in societies at their earliest stage of development.

Barter versus Gift Exchange

Barter played an important role in many non-European societies prior to contact and integration with modern Western economic systems. Its use (and the presence of different social and economic values) is often recorded by explorers: Captain Cook, for example, traded guns for pigs in the Marquesas

That which costs little is less valued. • Miguel de Cervantes (1547–1616)

Islands on his first visit in April 1744, but found the supply of pigs quickly dried up. Having no understanding of the important role of the animal in commemorative feasts (which limited the number for sale), he assumed that he and his crew had simply oversupplied the market with guns.

Modern anthropologists recognize an important distinction between commodity exchange and gift exchange. They perceive barter as one form of commodity exchange (commodities are items that are sought after, such as animals or cars, that have both a use value and an exchange value). While the aim of commodity exchange is to obtain goods, the aim of gift exchange is to place the person (or group) that receives the gift under an obligation. The anthropologist Christopher Gregory, in a detailed study of this distinction, argued that commodity exchange establishes a relationship between the objects exchanged, while gift exchange establishes a relationship between the subjects making the exchange. Barter, as thus described, is identified as an exchange of items that are not tied to social systems (as gifts are) through the hands of more or less strangers. No form of dependence (social or political obligation) is supposedly created in these transactions. In reality the distinction is not so clear-cut. In situations where the exchange of gifts precedes the exchange of commodities, for example, a web of links ties the two types of exchange together. Indeed, simple acts of barter can often be part of a much more complex process of political, social, and economic interaction between people.

Barter Today

Barter is still a significant form of economic activity today, even in societies that use money. Despite the theories of Aristotle and Smith, barter cannot be associated merely with primitive economies. It is increasingly used by businesses: the International Reciprocal Trade Association in the United States claimed that in 2001 the barter of products between companies was worth over \$7.5 billion.

There are numerous barter clubs and associations in the United States that facilitate low-level transactions, mostly involving household goods. But not all barter is associated with strong economies. In Argentina, for example, the depressed value of the currency, the closure of banks, and mass unemployment have contributed to an increased use of barter. *The Guardian*, a British newspaper, reported on 25 April 2002 that with the shortages of cash, barter clubs emerged (sometimes located outside shopping centers) in Buenos Aires to enable people to exchange goods and services that they themselves made or supplied. Barter is thus very much a part of modern economic activity, both in strong economies and weak ones.

Benin

Centered in what is now south-central Nigeria, the long-lived Benin Empire influenced much of Africa through military power and trade beginning in the eleventh century. Ruled by a sophisticated mixture of monarchy and oligarchy, the people of Benin enjoyed a standard of living that rivaled any of the world's great cities, until the British conquered them in 1897.

The empire of Benin was among Africa's most important, with roots going back to the eleventh century, and it lasted until its conquest by Britain in 1897. Benin, one among many large empires of the Guinea Belt (the forest region of the southern half of west Africa), was located in the south-central part of what is now Nigeria (and not be confused with the modern nation of Benin).

Oral tradition reveals that the people of Benin (who now refer to themselves as "Edo") migrated from the east. They likely settled first at Ile-Ife before founding Benin City around 1000 CE. Little is known of Benin's earliest history. Oral tradition records thirty-one kings from the Ogiso dynasty, of whom Owodo was the last. Owodo was so cruel and inept that he was banished. The chiefs of Benin then ruled as a council with one of their own elected as ruler.

This oligarchic (relating to government by the few) experiment collapsed when the head of the chiefs attempted to make his position hereditary. Unable to resolve the crisis the people of Benin requested that a son from the royal house of Oduduwa, the mythical ruler of Ile-Ife, rule them. Oduduwa sent his son Oranmiyan. Historians debate whether the story of

Oranmiyan represents dominance or conquest by the Yoruba people. Oranmiyan eventually left the city in frustration, and the next *oba* (the title by which the king of Benin was henceforth known) was his son, Eweka I. The *obas* of Benin claimed divine descent from Oranmiyan, and this pedigree was central to royal authority.

Political History and Transformation

Tension between the *oba* and the chiefs remained a central part of Benin's politics. Ewuare (reigned 1440–1473) was likely Benin's most famous king and

Historical illustration of the city of Benin in 1670, some two hundred years before the British made it part of their protectorate in Nigeria.

is credited with turning the kingdom into an empire. He came to power after a violent succession dispute and introduced a new level of militarism. Benin conquered many of its neighbors, including the western Igbo, some Yoruba kingdoms, and various riverine peoples of the Niger River delta. The empire was indirectly ruled; indigenous leaders were left in power so long as they paid tribute.

Ewuare redesigned the capital by separating the palace (*ogbe*) from the town (*ore*) by a broad avenue. The densely populated city of intersecting streets featured craftspeople, artisans, merchants, blacksmiths, and priests organized by guilds and age grades. Ewuare created two important associations: Eghaevbo n'Ogbe (Palace Chiefs) and Eghaevbo n'Ore (Town Chiefs), who were his highest advisers, although none of the offices was hereditary. In time the Town Chiefs became a permanent source of opposition to the palace, particularly its head, the Iyase, who was commander of the army. Ewuare created an elaborate annual cycle of royal ceremonies and introduced coral beads as

a symbol of royal power. A century of expansion continued after Ewuare under Ozolua, Esigie, and Orhoghua.

Royal power was supplemented by religious power from the head priests, the Osa and Osuan. The Emeru (Seven Caretakers of Sacred Brass Vessels) and Ooton (Seven Caretakers of Royal Ancestors) also lent their supernatural power to the *oba*. Like many peoples of the Guinea Belt, the people of Benin engaged in human sacrifice. Written accounts indicate that human sacrifice was restricted to royal rituals and involved a limited number of victims.

Succession disputes were common in Benin's history. The royal line had become so dissipated by the seventeenth century that extreme competition developed among rivals. As the power of the *oba* weakened, the strength of the chiefs increased. This increase culminated during the late seventeenth century in a civil war between *obas* Ewaukpe and Akenzua and Ode, who was the Iyase. The war strengthened the power of the Ezomo, a chief who controlled the village of Uzebu. The Ezomo gained the right to appoint his

own chiefs, becoming, in essence, a secondary *oba*. From this period onward royal art grew increasingly important and innovative as it became a political tool to assert royal control. Benin emerged from the civil war stable and prosperous for most of the latter half of the eighteenth century. The political history of Benin during the nineteenth century consisted of complex interplay between the *oba*, Ezomo, Eghaevbo n'Ogbe, and Eghaevbo n'Ore.

Benin and Africa

Military might largely held the Benin Empire together. In an indirectly ruled empire local leaders had a large degree of autonomy. Benin's military ensured that local leaders paid their tribute. Local rulers did sometimes break way from Benin, as the trading state of Warri did during the nineteenth century. Relations with various Yoruba kingdoms to the north were often violent, particularly with the growth of the areas of Ilorin, Oyo, and Nupe during the seventeenth and eighteenth centuries. Benin served as a nexus for trade goods from throughout the region, including textiles, beads, slaves, ivory, pepper, coffee, palm oil, woods, leather goods, horses, and salt. Via Hausaland, Benin participated in trans-Saharan trade.

Benin and the World

Benin's first contact with Europeans came during the reign of Ewuare. The first visitors were impressed with what they saw and remarked on the hospitality of the people, the safety of the streets, and the high standard of living and cleanliness. Records show that the people of Benin probably lived as well as people in any major city of the time. Europeans of the sixteenth through eighteenth centuries saw Benin as a sophisticated civilization. The Portuguese sent Catholic missionaries to Benin during the reign of Esigie, but few converts were gained.

As European interest in African slaves grew, Benin participated in the transatlantic slave trade. Although a significant source of income, slave trade never dominated Benin's economy, nor was it related to Benin's territorial expansion. Scholars traditionally argued that the slave trade lowered the value of human life in Benin, leading to an increase in the volume of human sacrifice. Current scholarship suggests that nineteenth-century European accounts of widespread human executions were exaggerated to justify conquest. Despite heavy resistance, the British captured Benin in 1897 and integrated it into the British protectorate of Nigeria. This

The King of Benin . . . has great influence among all the surrounding peoples . . . His authority stretches over many cities, towns, and villages. There is no King thereabouts who is in the possession of so many beautiful cities and towns, or is his equal. • **Olfert Dapper (1636–1689)**

conquest ended the *oba*'s political power, but the institution of the *oba* continued. The memory of the empire of Benin remains important in south-central Nigeria, and the *oba* retains great ritual and symbolic importance.

Berlin Conference

Contrary to popular belief, the purpose of the Berlin West African Conference of 1884–1885 was not to partition control of Africa amongst the European powers. Officially, the conference merely established free trade areas on the Congo basin and set rules for new occupations of Africa’s coast, but in the periphery, representatives during the conference (not at the conference) negotiated territories.

The Berlin West African Conference of 1884–1885 was the result of a joint initiative of German chancellor Otto von Bismarck (1815–1898) and French prime minister Jules Ferry (1832–1893), undertaken in response to the Anglo-Portuguese Treaty of 26 February 1884, by which Britain recognized Portuguese sovereignty over the entire mouth of the Congo River. France and Germany were opposed to this unilateral action, and they invited Great Britain and Portugal to take part in an international conference to be held in Berlin. The conference was to deal with freedom of trade in the basin and mouth of the Congo, with freedom of navigation on the Congo and the Niger, and with defining the formalities to be observed when taking possession of new territories on the African coast. After Britain and Portugal agreed to participate, other countries were also invited to attend, beginning with those having interests in the regions concerned—the Netherlands, Belgium, Spain, and the United States. The International Congo Association, although a non-state actor with ostensibly humanitarian aims, but in reality an instrument for Belgian King Leopold II’s imperialist ambitions and a check on colonialist activities that could threaten Belgium’s neutrality, was also present. The remaining nations were invited

purely for show, or, as the letter of invitation more elegantly put it, “to ensure general agreement on the conference resolutions.” These countries were Austria-Hungary, Sweden-Norway, Denmark, Italy, Turkey, and Russia. The invitations went out in October and the conference opened on 15 November 1884.

The Conference

Already during the opening session the British representative, Edward Malet, made it clear that Britain considered the Niger as its exclusive sphere of influence and therefore refused to discuss it on a par with the Congo. With Britain indisputably the paramount power on the Niger, the others agreed, and thus in actual practice the Berlin West African Conference became the Berlin Congo Conference, the name by which it is now generally known. Two important points remained to be dealt with: determining the size of that part of the Congo area where free trade would be the rule, and the formalities for new occupations on the African coasts.

The general feeling of the conference was that the free-trade area should be as large as possible. The result was that two free-trade zones were approved. The first was defined as “the basin of the Congo and its tributaries” and stretched from the Atlantic to the Great Lakes in the Great Rift Valley of east central Africa. On the coast the northern boundary was fixed at 2°30′2″ south, while the mouth of the Loge River was adopted as the southern limit. This coastal outlet was therefore fairly narrow, but immediately behind it the region fanned out broadly to the north as well as to the south. To the east of it lay the other free-trade area, termed the eastern maritime zone, which stretched from the Great Lakes to the Indian Ocean.

Its northern coastal boundary was fixed at 5° north and its southern boundary at the mouth of the Zambezi River. The two free-trade territories, the Congo basin and the eastern zone, were jointly referred to as the conventional Congo basin.

The last item on the agenda was the formalities for new occupations. This point is the most important historically, because it has given root to the theory that at the Berlin Conference Africa was divided up by the European powers. This is not true. As the invitation letter indicated, the conference was only to deal with new occupations, not already existing ones, and only with the African coasts, not with the interior. These restrictions are quite understandable. About the interior Europeans and Americans knew next to nothing, and in order to deal with the already existing claims, they would have had to make an inventory of all the regions concerned and all the powers involved. When one delegate suggested doing that, the French ambassador observed that that would be “tantamount to a partition of Africa,” which was not within the competence of the conference. Therefore it was decided, that the conference should stick to the text of the letter of invitation and only deal with *new* occupations on the African *coasts*. Therefore in the General Act of the Conference it was declared that any signatory of the Act that was taking possession of a new coastal region or setting up a protectorate over it had to notify the other signatories of its actions and to exercise a measure of effective authority. In light of the fact that scarcely any coastal parts remained unoccupied, however, in practice this proviso meant virtually nothing.

Implications of the Berlin Conference

The Berlin Conference has often been described as the conference at which the Europeans divided up Africa. The first president of Ghana, Kwame Nkrumah, for example, wrote, “The original carve-up of Africa was arranged at the Berlin Conference.” Many textbooks, too, have expressed this mistaken point of view. Africa was *not* divided at Berlin, and the subject was not even on the agenda; indeed, the idea of a partition of Africa was explicitly rejected by the conference.

There was, however, some partitioning going on in Berlin, not at the conference but in the corridors. That was an altogether different business, one not of principles and international law but of negotiating and horse-trading. That was not a matter of conference diplomacy, meaning multilateral diplomacy, but of bilateral diplomacy, and though it took place *during* the conference, it did not take place *at* the conference. The Congo Free State founded by Leopold II of Belgium, for example, was seeking recognition and acceptance of its borders. Some of that business had already been done before the conference opened, but the most important bilateral treaties between the Free State and the Western powers were signed in Berlin. The result of this was the creation of one of the biggest European colonies in Africa, the Congo Free State, which would later become the Belgian Congo.

Big History

The study of big history places the history of humanity and Earth in the largest possible context, that of the universe. In 1991, David Christian coined the term *big history* in an article he wrote for the *Journal of World History*, although the first courses utilizing the concept of big history were taught in the late 1980s.

Describing the content of a typical course in big history may convey something of big history's scope and scale. Such courses normally begin with the origins of the universe and the first stars and galaxies, surveying some of the central ideas of modern cosmology and astronomy. The creation of new chemical elements in dying stars and supernovae allowed the creation of more chemically complex entities such as planets, and leads naturally to the earth sciences and biology. Big history courses survey the origin and history of our Earth and the origin and evolution of life on Earth—the only planet so far where we know for certain that life exists. The evolution of our own species, *Homo sapiens*, leads naturally to a survey of human history. Within this large story the distinctiveness of human history stands out, for we can see the large patterns that are hidden at the scales of traditional history teaching. We see how our species began to display a unique capacity for sustained adaptation and innovation, which allowed its members to extract more and more resources from the biosphere, to begin supporting larger populations, and eventually to create more complex human communities, which generated new adaptations even more rapidly in a complex but powerful feedback cycle. This accelerating process of adaptation through cultural change is easiest to see during the last 10,000 years since the

appearance of agriculture, but it was already apparent in the Paleolithic (foraging) era in the technological innovations that allowed our ancestors to settle all the world's continents apart from Antarctica. Today we can see that our remarkable propensity for sustained and accelerating innovation has its dangers. So courses in big history inevitably raise large questions about the future of our species and its relationship with the biosphere, as well as about the future of our Earth and of the universe as a whole.

In the late 1980s the U.S. astrophysicist Eric Chaisson taught one of the first courses in big history; he was soon followed by David Christian in Australia and John Mears in the United States. (Christian actually coined the term itself in a 1991 article for the *Journal of World History*.) Today such courses are still rare, though their number has increased. Courses in big history can now be found in Russia and the Netherlands as well as in Egypt, Australia, India, and Korea; analogous courses have also been taught in geology departments (by Walter Alvarez, for example). Their growth has been driven, at least in part, by the thirst of students for a more unified vision of the past and of scholarship in general, and for approaches that help overcome the extreme intellectual fragmentation of modern education and scholarship.

Universal History: An Ancient Tradition

Today, big history may seem anomalous. Yet the questions it pursues are ancient. Most societies we know of have tried to construct coherent and unified accounts of the entire past using the best information available to them, in order to explain the existence and

Spiral Galaxy M83 as photographed by the Hubble Space Telescope. Looking at the formation of other galaxies helps us understand the creation of our own. National Aeronautics and Space Administration.

nature of the universe we inhabit and the communities of which we are members. This is what traditional creation myths did. All literate cultures have also produced analogous accounts of origins at multiple scales. Christian cosmology described a universe approximately 5,000 to 6,000 years old, with the Earth at its center. That story provided the basic framework for historical thinking in the Christian world for 1,500 years, and some still think within the same framework today. Even after the Scientific Revolution had undermined the credibility of Christian cosmology, historical thinkers continued to construct universal maps of space and time, although now they did so within more secular traditions of thought whose basic

parameters were provided by Newtonian science. Universal histories were constructed during the Enlightenment and during the nineteenth century. This was the tradition within which both Georg Wilhelm Friedrich Hegel and Karl Marx wrote. Even Leopold von Ranke, who is often thought of as the pioneer of modern traditions of detailed, empirical historical research, insisted that the ultimate goal of historical scholarship should be the creation of universal histories, and in his final years he attempted to write such a history himself.

Yet today this ancient tradition of writing universal history is barely remembered. It vanished, suddenly and decisively, at the end of the nineteenth

Within fifty years after the 1906–1907 excavations of the Iron Age burial grounds pictured here at Smörkullen (Alvastra, Östergötland, Sweden), radiometric-dating techniques began to revolutionize our understanding of the past.

century. Why it vanished remains unclear. Nationalistic perspectives on the past discouraged the search for commonalities between societies and encouraged geographical and cultural specialization. The growing prestige of the natural sciences raised standards of rigor and precision in all scholarly disciplines and showed how flimsy were the empirical foundations of even the most interesting attempts at universal history. Eventually historians turned away from large, speculative histories toward detailed empirical research, often modeling their scholarship on the techniques of archival research associated with the work of Ranke.

Many historians may have hoped that sustained empirical research would spontaneously generate new, more “scientific” accounts of the past at large scales. After all, something like that seemed to have occurred in biology, where Charles Darwin provided a wonderful model of how sharply focused empirical research might yield grand unifying theories. But in history no grand unifying story emerged, and the very

idea of universal history began to seem Utopian. H. G. Wells attempted a universal history in the 1920s, but his work was ignored by professional historians, and probably with good reason. Like the great universal histories of the nineteenth century, Wells’s *Outline of History* contained too much speculation and too little hard information, particularly about the deep past. Eventually many historians began to think there was something fundamentally different about history. R. G. Collingwood argued, for example, that history was different from the natural sciences because it dealt with an unpredictable world of conscious actions rather than merely with events. “The events of nature are mere events, not the acts of agents whose thought the scientist [i.e., historian] endeavors to trace” (Collingwood 1994, 214). The historian’s goal, therefore, was not to seek general laws, but to “penetrate” the thoughts that motivated past actions. That was why historians seemed to occupy a different epistemological universe from natural scientists.

In the 1960s, Arnold Toynbee, one of the few historians who regretted the passing of universal history, complained in an interview with the writer Ved Mehta (1962, 143) that “the microscope historians . . . whether they admitted it or not, had sacrificed all generalizations for patchwork, relative knowledge, and they thought of human experience as incomprehensible chaos.” But he also believed the days of microscope history were numbered: “in the perspective of historiography, they were in the minority, and Toynbee, in company with St. Augustine—he felt most akin to him—Polybius, Roger Bacon, and Ibn Khaldun, was in the majority” (Mehta 1962, 143).

Fifty years later, Toynbee’s remarks look more prescient, as universal history makes a comeback in the new form of big history. Why are some historians returning to the idea of universal history? The main reason is that we can now study universal history with a rigor and precision that was unthinkable in the nineteenth century. A century of detailed research, not just in history, but also in neighboring disciplines such as archaeology, paleontology, linguistics, and genetics, has revolutionized our understanding of

Observe constantly that all things take place by change, and accustom thyself to consider that the nature of the Universe loves nothing so much as to change the things which are, and to make new things like them. • **Marcus Aurelius (121–180 CE)**

the human past, extending it both in time and space. Meanwhile, the natural sciences look more historical than they did a century ago. Astronomy became a historical science with the rise of big bang cosmology; the theory of plate tectonics re-affirmed the historical nature of the earth sciences; and the discovery of DNA clinched the evolutionary nature of biology. One of the most fundamental changes has been the appearance of new dating techniques that have revolutionized our understanding of the past at all scales. Sixty years ago, absolute dates could be confidently assigned to past events only if there existed written records. So no reliable historical timeline could extend back more than a few millennia, and all earlier periods were lost in a sort of chronological haze. In the 1950s, Willard Libby established the first reliable techniques of radiometric dating, based on the regular radioactive breakdown of carbon-14. As radiometric methods have been improved and applied more widely, and eventually joined by other chronometric techniques, we find ourselves able to construct rigorous timelines that extend back not just to the origins of our species (c. 100,000 years ago) or even of our Earth (c. 4.5 billion years ago) but to the very beginnings of the universe, which we can now date, with remarkable precision, to about 13.7 billion years ago. This dazzling “chronometric revolution” has provided the chronological framework for a new, scientific account of the past at all scales (Christian 2008a and 2009).

Some Themes in Big History

Can there be any thematic coherence in a discipline that spans so many different spatial and chronological scales, and such a diversity of modern scholarly disciplines? It is already apparent that there is a coherent story of origins to be told within big history as it surveys the origins of the universe, the Earth, of life on Earth and of humanity. But unifying themes are also emerging. All the entities that stand out in the story of big history are complex: they are composite entities, formed according to precisely specified patterns, and they display novel “emergent properties.”

They are also characterized by significant energy flows that sustain their complexity. So it is no accident that complex entities such as the biosphere can be found on the surface of bodies close enough to a star to benefit from the huge energy flows that stars pump into the cold space surrounding them. As the astrophysicist Eric Chaisson has pointed out, the density of these energy flows may allow us, loosely, to order complex entities by their degrees of complexity. Such calculations suggest that living organisms may be significantly more complex than stars or planets, and modern human society may be one of the most complex entities we know of. These considerations suggest that the slow emergence of new forms of complexity can provide a common theme and a common research agenda, encouraging scholars in many different disciplines to explore similar questions about complexity itself, and the different forms it takes within our universe.

The theme of rising complexity also suggests that human history may be peculiarly interesting. If living organisms are distinguished by their remarkable capacity to adapt to changing environments, our own species is distinguished by the fact that it can adapt continuously. While most species (including highly intelligent species such as the great apes), are limited by their genetic endowments, humans can adapt continuously because the remarkable efficiency of human speech allows us to exchange learned information in great volume and with great precision. As a result, learned information can accumulate culturally, and that is why our species alone seems to continually develop new patterns of behavior and new ways of extracting resources from its environment. This remarkable ability, which we can call “collective learning,” shapes the evolution of human societies as powerfully as natural selection shapes the evolution of biological species, but it operates much faster. And eventually it explains the increasing size and complexity of human societies. Our ability to learn collectively is the glory of our remarkable species, but also potentially its downfall, for we have acquired such power over our world that we are in danger of laying it to waste.

Big History and World History

There is a natural affinity between world history and big history. Big history considers the past at such huge scales that it can attempt, as more conventional types of history cannot, to understand the trajectory of human history as a whole. Because of its willingness to draw on information from multiple disciplines, it is not confined, as traditional “Rankean” forms of scholarship were, to the several millennia since the appearance of writing. It therefore provides a natural framework for the type of world history that will be needed increasingly in a world facing challenges (from the threat of nuclear war to that of ecological collapse) that cannot be tackled nation by nation. Big history provides a natural framework for the construction of a modern history of humanity.

Biological Exchanges

With few exceptions, the spread of plants, animals, and diseases was limited to geographically bound regions for much of the Earth's history. Humans facilitated biological exchange, intentionally and accidentally carrying species across natural borders. As opportunities for human travel increased, so did the opportunities for biological exchange, often with dramatic consequences.

During most of the history of life on Earth, geographic barriers such as oceans and mountain ranges divided the planet and inhibited migrations of most kinds. Only birds, bats, flying insects, and good swimmers consistently bucked the trend. A few other species did so occasionally, thanks to sea-level changes and land bridges or to chance voyages on driftwood. However, for most species most of the time, biological evolution took place in separate biogeographical provinces.

Intracontinental Biological Exchange

This long phase of separation ended when human beings began their long-distance migrations. Deep in prehistory hominids (erect bipedal primate mammals) walked throughout Africa and Eurasia, occasionally bringing a plant, seed, insect, microbe, or rodent to a place it would not have reached on its own. With plant and animal domestication ten to twelve thousand years ago, people began to transport such things on purpose and more frequently. Most of the plants and animals susceptible to domestication lived in Eurasia, and those sensitive to

climate or day length (several flowering plants take their cues to bloom from day length) spread most easily along the east-west axis of that continent. The sets of domesticated plants and animals on which Eurasian and North African agriculture and herding are based spread almost instantaneously by the standards of the past, although in fact the spread took a few millennia. This process of spreading no doubt proved highly disruptive biologically as local biogeographic provinces were invaded by alien creatures spread by humanity. It also proved highly disruptive historically, obliterating peoples who did not adapt to the changing biogeography, the changing disease regimes, and the changing political situations brought on by the spread of farmers, herders, and eventually states. Out of this turmoil of Afro-Eurasian biological exchange emerged the great ancient civilizations from China to the Mediterranean. They all based their societies on intersecting but not identical sets of plants and animals.

Biological homogenization within Afro-Eurasia had its limits. The links between northern Africa, say, and eastern Asia before 500 BCE were slender. Varying topography and climate also checked the spread of species. The process presumably accelerated when interregional contacts flourished, for example, when empires created favorable conditions for the movement of goods and people. The era of the Han dynasty (206 BCE–220 CE) in China and the Roman Empire, for example, when the trans-Asian trade route called the Silk Roads was a well-beaten path, unleashed a small flood of biological exchanges. The Mediterranean acquired cherries at this time, and possibly smallpox and measles, too; sorghum made its way from east Africa to India to China, and grapes,

camels, and donkeys arrived in China from southwest Asia and northern Africa.

Within Eurasian history two more moments of heightened biological exchange occurred. The next moment occurred during the early Tang dynasty (618–907 CE) in China. The Tang rulers came from various ethnic and cultural traditions and for a century and a half showed keen interest in things foreign: trade, technology, culture (e.g., Buddhism), and plants and animals. The court imported exotica: curious creatures, aromatic plants, ornamental flowers. Much of this exotica was inconsequential in social and economic terms, but some of it, such as cotton (imported from India), was not. The Tang were culturally receptive to strange plants and animals, but political conditions helped too: their political power on the western frontier, and the geopolitical situation generally before 750, promoted the trade, travel, and transport that make biological exchange likely.

For roughly a century and a half (600–750 CE) the numerous political organizations of Central Asia were frequently consolidated into only a few, simplifying travel by lowering protection costs. A handful of large empires held sway throughout Central Asia, making the connections between China, India, and Persia (modern-day Iran) safer than usual. These geopolitical arrangements fell apart after 751, when Muslims defeated Tang armies, and after 755, when rebellion shook the Tang dynasty to its foundations. Thereafter, both the stability of the geopolitical situation and the receptivity of the Tang to things foreign changed, waning more often than waxing, and the opportunities for biological exchange grew scarcer.

Another moment of heightened biological exchange within Eurasia occurred with the Pax Mongolica (Mongol Peace) of the thirteenth and fourteenth centuries. By this time most of the feasible exchanges of plants and animals had already taken place. However, the heightened transport across the desert-steppe corridor of Central Asia may have brought carrots and a species of lemon to China and a form of millet to Persia. Quite possibly this transport also allowed the quick diffusion from Central Asia of the bacillus that causes bubonic plague, provoking the famous Black

Death, the worst bout of epidemics in the recorded history of western Eurasia and northern Africa. Plague may also have afflicted China during these centuries, although the evidence is ambiguous.

Although this process of Eurasian (and North African) biological exchange never truly came to an end, it slowed whenever political conditions weakened interregional contacts. It also slowed in general after around 200 CE, with the erosion of two eras of peace—the Pax Romana (Roman Peace) and Pax Sinica (Chinese Peace), which had encouraged long-distance travel and trade within Eurasia. By that time sugarcane had taken root in India, spreading from its New Guinea home. Wheat had spread widely throughout most of its potential range, as had cattle, pigs, horses, sheep, and goats. Less and less was left to do even when political and economic conditions encouraged biological exchange.

Meanwhile on other continents, similar, if smaller-scale, processes of biological exchange and homogenization were in train. In the Americas maize spread both north and south from its Mesoamerican home (the region of southern North America that was occupied during pre-Columbian times by peoples with shared cultural features), slowed, it seems, by difficulties in adapting to different day lengths at different latitudes. In Africa the Bantu migrations of two thousand years ago probably diffused several crops throughout eastern and southern Africa and possibly brought infectious diseases that ravaged the indigenous, previously isolated, populations of southern Africa. These events in Africa and the Americas, too, must have been biologically and politically tumultuous, although the evidence is sparse.

In biological terms the process of human-promoted biological exchange selected for certain kinds of species, those that co-existed easily with human activity: domesticates, commensals (organisms that obtain food or other benefits from another without damaging or benefiting it), and plants that thrive on disturbed ground, most of which we usually call “weeds.” These species prospered under the new regimes of expanded human migration and interaction; for them, history had taken a favorable turn. Indeed, humanity was

in a sense working for them, spreading their genetic footprints far and wide within the continents and into the future.

Biological Exchange and Biological Invasion

Intercontinental biological exchange also has a long pedigree. The first people to migrate to Australia may have accidentally brought some species with them forty thousand to sixty thousand years ago. About thirty-five hundred years ago, later migrants to Australia purposely brought the dingo (a large dog), the first domesticate in Australian history. The dingo quickly spread to all Aboriginal groups outside of isolated Tasmania and also formed feral packs. It proved an effective hunting dog and led to the extinction of some indigenous mammals. The dog (not the dingo) was also the first domesticated animal in the Americas, brought across the Siberian-Alaskan land bridge with some of the first settlers during the last Ice Age. Here dogs probably played a significant role in reducing the populations of large mammals, many of which became extinct soon after humans arrived in North and South America. Initial human settlement of unpopulated islands also wrought major ecological changes throughout the southwest Pacific and Polynesia, including numerous extinctions, from about four thousand years ago until the colonization of New Zealand roughly seven hundred or one thousand years ago.

All of these instances were invasions of “naive” lands—continents and islands that had no prior exposure to humanity and its fellow travelers or to the intensified fire regimes that human presence normally brought. This fact helps to explain the dramatic effects, particularly the rash of extinctions that followed upon human settlement of Australia, New Zealand, and the Americas.

Eventually people began to transport animals, plants, and pathogens from one human community to another across the seas. In many cases the only evidence for such transfers is the existence of the imported species. The sweet potato, a native of South

America, somehow arrived in central Polynesia by 1000 CE and subsequently spread widely throughout Oceania (lands of the central and southern Pacific). It is a delicate crop and could not survive a driftwood voyage: no one doubts that people transported it, although no one knows just when, how, or even who. It eventually became a staple food in the western Pacific, highland New Guinea, and to a lesser extent the eastern Asian archipelagoes and mainland.

A second mysterious transoceanic crop transfer took place across the Indian Ocean some time before 500 CE. Somebody brought bananas, Asian yams, and taro to eastern Africa. These crops had much to recommend them because they do well in moist conditions, whereas the millets and sorghum that Bantu expansion brought into central and southeastern Africa were adapted to dry conditions. Plantains, of which bananas are one variety, had existed in the wild from India to New Guinea. Linguistic and genetic evidence suggests they arrived on the east African coast as early as three thousand years ago and reached the forest zone to the west of Africa’s Great Lakes around two thousand years ago, just about the time of the Bantu migrations. Quite possibly the success of Bantu speakers, often attributed to their use of iron, owed something to their successful adoption of these exotic crops. As relative newcomers to eastern and southern Africa, they had less invested in prevailing ecological patterns and fewer disincentives to experiment. Bananas, taro, and yams were probably introduced to eastern Africa more than once and almost surely were brought again in the settlement of Madagascar that took place not long before 500 CE. These Asian crops assisted in the epic (but unrecorded) colonization of central Africa’s moist tropical forests by farmers, as well as in the settlement of Madagascar.

Several other significant intercontinental biological transfers took place before 1400 CE, mainly between Africa and Asia, a route that posed minimal obstacles to sailors. Africa’s pearl millet, derived from a western African savanna grass, is the world’s sixth-most-important cereal today. It was introduced into India three thousand years ago and today accounts for about 10 percent of India’s cereal acreage. East

African sorghum entered India at about the same time and eventually became India's second-most-important grain after rice. Sorghum stalks were also useful as fodder for India's cattle. Finger millet, also from Africa, arrived in India only around one thousand years ago. It became the staple in Himalayan foothill communities and in far southern India. The transfer of African crops to south Asia mainly provided India with drought-resistant dryland crops, opening new areas to settlement and providing a more reliable harvest where water supplies were uncertain. These examples suggest a lively world of crop exchange—and probably weeds, diseases, and animals, too—around the Indian Ocean rim from about three thousand to fifteen hundred years ago. The regular monsoon winds of the Indian Ocean helped make this region of the world precocious in its maritime development and hence biological exchange.

Whereas south Asia received new crops from Africa, it sent new crops to the Middle East and the Mediterranean. Facilitated by the relative peace supervised by the Abbasid dynasty (749/750–1258), between the tenth and thirteenth centuries Arab trading networks brought sugar, cotton, rice, and citrus fruits from India to Egypt and the Mediterranean. These plants, and the cultivation techniques that came with them, worked a small revolution on the hot and often malarial coastlands of northern Africa, Anatolia in Turkey, and southern Europe. They caused many coastal plains to be brought under cultivation on a regular basis, often for the first time since the Roman Empire. Sugar and cotton could flourish with unskilled and unmotivated slave labor; their introduction may have quickened the slave raiding that kept Mediterranean and Black Sea populations anxious for centuries. Keeping an army of laborers at work on deadly malarial coasts—in the Levant (countries bordering on the eastern Mediterranean), Egypt, Cyprus, Crete, Sicily, Tunisia, and Andalusia in Spain, to mention a few centers of sugar production—required constant topping up from poorly defended peasantries. This quest took slave merchants and raiders to the Black Sea coasts but also across the Sahara Desert and along Africa's

Atlantic coast. Saadian Morocco, a state originally based on plantations in the Sous and Draa River valleys, brought sugar and African slaves together in a profitable mix that would soon be transplanted to Atlantic islands such as the Canaries and Madeira and then to the Americas.

A second avenue of exchange linked the Mediterranean basin to western Africa. Although this exchange was not genuinely intercontinental, the Sahara Desert for several millennia functioned somewhat like a sea, as the Arabic term for “shore” (*sahel*) for the western African desert edge implies. One thousand years before Christopher Columbus crossed the Atlantic, some unknown soul crossed the Sahara, reuniting the Mediterranean and the *sahel*, which the increasingly arid Sahara had divided since about 3000 BCE. Trans-Saharan trade developed in salt, slaves, and gold. However, this reunification no doubt included a biological dimension. Large horses seem to have made their debut in west Africa via trans-Saharan trade. Linguistic evidence suggests they came from the Maghreb region in the north. Horses eventually became a decisive element in a military revolution in the *sahel*, creating a mounted aristocracy who by the fourteenth century built imperial states. The Jolof, Mali, and Songhai empires of west Africa depended on horse cavalry, which underwrote their military power and, via slave raiding, their economies. When ecological conditions permitted, these empires bred their own warhorses, and when conditions did not permit, the empires had to import them, usually from Morocco. In any case, the social, economic, and political history of west Africa took a new direction with the arrival of large horses.

These events show that long before the great age of oceanic navigation, the links of trade and colonization in the Pacific Ocean, in the Indian Ocean, and across the Sahara Desert brought biological exchanges that powerfully influenced the course of history. The further exchanges attendant upon the voyages of Columbus, the Portuguese navigator Ferdinand Magellan, the British sea captain James Cook, and others extended this process, wrenchingly, to lands formerly quite separate in biological (as in other) terms.

Biological Globalization

After 1400 CE mariners linked almost every nook and cranny of the humanly inhabitable Earth into a biologically interactive unit. The world's seas and deserts were no longer isolated biogeographical provinces. The world became one without biological borders as plants, animals and diseases migrated wherever ecological conditions permitted their spread, although how soon and how thoroughly they did so often depended on patterns of trade, production, and politics.

Columbus inaugurated regular exchanges across the Atlantic whereby the Americas acquired a large set of new plants and animals as well as devastating diseases that severely depopulated the Americas between 1500 and 1650. Simultaneously, Africa and Eurasia acquired some useful crops from the Americas, most notably potatoes, maize, and cassava (manioc). Ecosystems and societies in the Americas were remade with new biologies and new cultures. The same thing was true, however, even if less catastrophically, in Africa and Eurasia. The new food crops fed population growth in Europe and China and possibly in Africa, too (no firm evidence exists). Maize and potatoes changed agriculture in Europe, as did maize and sweet potatoes in China, allowing more intensive production and allowing lands not suited to wheat, barley, rye, or rice to come into production. In Africa maize, cassava, and peanuts became important crops. Today 200 million Africans rely on cassava as their staple food. Many of the rest, mainly in the south and east, rely on maize.

These modern biological exchanges had political meanings and contexts. European imperialism, in the Americas, Australia, and New Zealand, simultaneously promoted, and was promoted by, the spread of European (or more usually Eurasian) animals, plants, and diseases. Europeans brought a biota (the flora and fauna of a region) that worked to favor the spread of European settlers, European power, and Eurasian species and thereby to create what Alfred Crosby, the foremost historian of these processes, called "neo-Europes"—including Australia, New Zealand, most

of North America, southern Brazil, Uruguay, and Argentina.

Beyond the neo-Europes, in the Americas something of a neo-Africa emerged. More than 10 million Africans arrived in the Americas in slave ships. In those same ships came yellow fever and malaria, which profoundly influenced settlement patterns in the Americas. The ships also brought African rice from the west coast, which became the foundation of the coastal economy in South Carolina and Georgia during the eighteenth century and was important in Suriname in South America as well. Other African crops came, too: okra, sesame, and (although not in slave ships) coffee. African biological impact on the Americas did not cease with the end of the slave trade. Much later African honeybees imported into Brazil crossbred to create an "Africanized" bee that since the 1950s has colonized much of the Americas.

The age of sail brought the continents together as never before. But sailing ships did not prove hospitable carriers to every form of life. They filtered out a few, those that could not for one reason or another survive a long journey or that required conditions that sailing ships could not provide. The age of steam and then the age of air travel broke down yet further barriers to biological exchange, adding new creatures to the roster of alien intruders and accelerating the dispersal of old and new migratory species alike.

The advent of iron ships toward the end of the nineteenth century, for example, opened a new era in biological exchange involving species of the world's harbors and estuaries. After the 1880s iron ships began to carry water as ballast. Soon special water ballast tanks became standard, and thus, for example, a ship from Yokohama, Japan, bound for Vancouver, Canada, would suck up a tankful of water and, more than likely, a few marine species from Japanese shores, cross the wide Pacific, then release its Japanese water and sea creatures in Puget Sound before taking on a Canadian cargo. During the 1930s Japanese clams hitched such a ride and upon arrival began to colonize the seabeds of Puget Sound, creating a multimillion-dollar clam fishery in British Columbia and Washington State. A jellyfish that devastated

Black Sea fisheries came from the East Coast of the United States in about 1980. The zebra mussel, a Black and Caspian seas native, colonized the North American Great Lakes and river system from a beachhead established near Detroit in 1985 or 1986. It has cost the United States and Canada billions of dollars by blocking water intakes on city water systems, factories, and nuclear power plants.

A more recent invader of the North American Great Lakes is the fishhook flea, a crustacean that is a native of Caspian and Black sea waters. It first appeared in Lake Ontario in 1998 and is now in all the Great Lakes and New York's Finger Lakes, menacing sport and commercial fisheries and disrupting the lakes' food web. The failures of Soviet agriculture and the expanded grain trade from North America during the 1970s and 1980s created a new pattern of ship traffic that quickly brought disruptive biological exchanges. Nowadays thirty-five thousand ocean-going ships and three thousand marine species are in transit at any given time, linking the world's harbor and estuarine ecosystems as never before. The exchanges via ballast water are but a single variety of the swirl of biological exchange going on in modern times. Transport, travel, and trade take place on such a scale now and with such rapidity that a vast homogenization of the planet's flora and fauna is under way.

Perspectives

From the Olympian height that allows a view of all life on Earth over its entire history, the last ten thousand years appear as an instantaneous homogenization of ecosystems, a new era in Earth history. Humankind has connected formerly distinct spheres of life through trade and travel, reprising in the blink of an eye what previously happened through continental drift. Some 300 to 250 million years ago the world's continents fused to form a single supercontinent, called "Pangaea." Creatures formerly kept apart from one another now rubbed shoulders. Large numbers of them became extinct by about 220 million years ago, perhaps in part on account of this new familiarity (although other theories exist). Reptiles inherited the Earth,

spreading throughout the globe. During the last few millennia the human species has once again fused the continents, and to some extent the seas, and is probably provoking (through this and other means) the sixth great extinction spasm in the history of Earth.

From a less Olympian height, other vistas present themselves. The process of biological exchange is much influenced by the technology of transportation. The invention of ships, of ocean-going ships, of ballast tanks, of railroads and airplanes all led to changes and surges in the pattern of biological exchange. Transport technology provides one rhythm. Another rhythm is political.

Some states and societies showed great eagerness to import exotic species. Monarchs of ancient Egypt and Mesopotamia buttressed their prestige by maintaining gardens and zoos filled with exotic plants and animals. The Tang dynasty, as noted, showed a similar enthusiasm. Thomas Jefferson tried his best to establish rice and silkworms in Virginia. Later, the U.S. government employed an army of plant prospectors, who scoured the globe for potentially useful species and brought tens of thousands to the United States. During the nineteenth century Australia and New Zealand featured "acclimatization societies," which imported species that met with their approval (usually from Britain). Nowadays the United States, Australia, New Zealand, and many other countries spend vast sums trying to prevent the importation of unwanted species, hoping to forestall biological invasions rather than foment them. Altogether, biological invasions now cost the United States more than all other natural hazards combined, including floods, hurricanes, tornadoes, earthquakes, and so forth.

Beyond the disposition that any society might have toward exotic species, the changing nature of geopolitics also affected biological exchange. Trade and travel—and presumably biological exchange—expanded in times of peace and contracted in times of war, brigandage, and piracy. Probably eras of imperial unification provided the best political environment for biological exchange, when a single power enforced a general peace. Anarchic systems of competing states probably

checked biological exchange by slowing trade and travel, notwithstanding the effects of mobile armies and navies. Furthermore, imperialism also seems to have inspired, as well as eased, the process of collection: botanical gardens and the like. Kew Gardens outside of London proved a crucial link in transferring rubber seeds from Brazil to Malaya at the end of the nineteenth century, starting a new plantation economy in southeast Asia. The swings between moments of consolidated imperialism and anarchic struggle established another rhythm governing the history of biological exchange. This rhythm, of course, was influenced in turn by biological exchanges, as in the case of horses on the African savanna.

One can only postulate such patterns in the history of biological exchange. Demonstrating their validity would require quantitative evidence beyond what one can reasonably hope to find. Yet, one may be sure that time and again during the past ten millennia biological exchange has altered history. The next ten millennia will be quite different: fewer exchanges of existing species will take place because so many already have. Newly engineered species will occasionally depart from their creators' scripts, however, fashioning unpredictable biological dramas. Some of these surely will help shape the future.

Birth Control

Birth control encompasses a range of tactics, devices, medications, practices, and procedures designed to deliberately prevent or reduce the likelihood of pregnancy or childbirth. During the twentieth century, motivation for birth control ranged from individual choice to concern about increasing populations. In the twenty-first century birth control is seen as the responsibility of both sexually active men and women.

The history of birth control enables us to understand the global reverberations of an agenda for wider dissemination of contraceptive information that began in the early twentieth century. For most part, advocates of birth control in countries such as India, Japan, South Africa, Canada, Great Britain, and the United States came from privileged social, cultural, and economic backgrounds. Advocates of birth control found eugenic, Malthusian, and demographic arguments most compelling in making a case for national and international support for birth control and contraception. Some advocates also linked the demand for birth control to improved maternal health and national well being.

No history is complete without a set of historical actors; important participants in the debates on birth control dating from the 1920s onwards included such players as Mary Burgess, Kamaladevi Chattopadhyay, Ragnunath Dhondo Karve, A. R. Kaufman, Edith How-Martyn, Eileen Palmer, Narayan Sitaram Phadke, Aliyappin Padmanabha Pillay, Margaret Sanger, Ursala Scott, Kato Shidzue, Marie Stopes, and Elsa Woodrow. As the above list—which does not purport to be complete—suggests, far from being a solely Western phenomenon, the demand for birth control was a

complex intercontinental movement, with an active cohort that supported and sometimes competed with one another's work across national boundaries. This cohort of activists collectively created a global propaganda effort to gain acceptance for their controversial demand both within and beyond their nations.

Domestic resistance and political realities made it important for many advocates to seek a larger global platform to win support for their cause. For instance, international prominence and recognition greatly facilitated the work of Margaret Sanger, a U.S. activist, since she faced strong opposition against birth control in the United States due to the Comstock Act (1871), which forbade any dissemination of contraceptive knowledge through the postal system. A similar law banning birth control was passed in Canada in 1892 and was not repealed until 1969. There were no legal bans imposed on birth control in India, Japan, or Great Britain during this time.

International Conferences and Publications

The early advocates of birth control worked on a global platform and were in dialogue with one another from as early as the 1920s, exchanging and borrowing ideas. Their modes of intellectual exchange included organizing international conferences such as the International Birth Control Conference, held in London in 1922 and in New York in 1925. Indian advocates such as Gopaljee Ahluwalia attended both these conferences, as did many other participants from across the globe. Another large population conference was organized in India in 1936; Sanger was among those invited.

The early advocates also published journals that became important intellectual sites for international exchange and discussion on the subject of contraception and birth control. Some of the important journals published from London, New York, Madras, and Bombay (now Mumbai) in the 1920s and 1930s were *Birth Control News* (United States), *Birth Control Review* (United States), *Madras Birth Control Bulletin* (India), and *Marriage Hygiene* (India). Again, this is not a comprehensive list, but one that points to the rich international variety of publication on the subject. Advocates solicited articles for these journals internationally, and many of these journals carried specific information on birth control work and clinics around the world.

Birth control advocates also published a large number of monographs and books on the subject, which circulated globally. Books by Sanger and Marie Stopes (a British activist) were read by birth control advocates in India, South Africa, Japan, Britain, and United States. Besides being read by a large body of birth control advocates, these books were also read by lay people seeking to control their own fertility. Many private individuals in India and South Africa who read books by Sanger and Stopes wrote to them asking for further clarification on the methods discussed in their books. Stopes's *Married Love* and *Wise Parenthood: The Treatise on Birth Control for Married People*, both published in 1918, circulated widely in South Africa and other parts of the British Empire. Sanger's books *Motherhood in Bondage* and *The New Motherhood* were popular around the world. International birth control activists also endorsed one another's books; Sanger, for instance, wrote a foreword for Narayan Sitaram Phadke's 1927 *Sex Problem in India*, which gave this book greater credibility in the eyes of domestic readers in colonial India.

Financial and Technological Support

Birth control activists sought financial support for their work from donors across the globe. Stopes, for instance, wrote letters to Indian princes in 1927 asking them to support her clinical work in London, while the Indian advocate Aliyappin Padmanabha

Pillay requested financial help from the London Eugenic Society to continue the publication of his journal *Marriage Hygiene*. Sanger wrote to C. P. Blacker, of the London Eugenic Society, to request funds for her India visit in 1935. Sanger's visit to Japan in 1922 was financed by the Japanese magazine *Reconstruction*. For her part, Kato Shidzue, a Japanese birth control advocate, went to the United States in 1937 to raise money for her work in Japan. She toured in the United States speaking about birth control.

Besides financial networks that crossed national boundaries, reproductive technologies were also transported globally. Stopes supplied contraceptives to South Africans in the 1930s. Stopes's Society for Constructive Birth Control and Racial Progress (SCBC) offered to train birth control activists from India and South Africa. Many advocates also visited Sanger in the United States hoping to gain technical training on the subject. Elsa Woodrow, from the Cape Town Mother's Clinic Committee in South Africa, contacted Stopes in 1931, seeking advice on how to set up a clinic and the costs associated with it. Her organization associated itself with the SCBC and ordered contraceptive supplies from Stopes. The Mother's Welfare Society of South Africa received financial support from Stopes in 1938–1939. On her various visits to India, Sanger and her assistant Edith How-Martyn carried contraceptive technology with them, which they distributed to the various clinics in India. They also presented advocates with gynecological plaques, which were used by doctors and advocate to demonstrate the use of different contraceptive methods.

Discursive Parameters

Early advocates of birth control drew upon a range of intellectual ideas to make a strong case for the dissemination of contraceptive information. Many advocates found it beneficial to deploy a numerical argument, relying heavily upon census figures that were increasingly becoming available in most countries during the early twentieth century. For instance, the colonial census of 1931 in India revealed

Mrs. Margaret Sanger, the great birth control advocate, and her two sons.

"WOMAN AND THE NEW RACE"

By Margaret Sanger

This book is Margaret Sanger's greatest effort for the birth control movement. It contains the very essence of her life's work. It pleads and instructs the women of the world in the greatest step of their emancipation. "Woman and the New Race" contains the sum total of her experience—the knowledge she dared to utter and print! The knowledge for which she faced jail and fought through every court to establish as woman's inalienable right to know.

HAPPINESS IN EVERY MARRIAGE

If you fail to read this book do not ever complain of any unhappiness that may be yours, resulting from lack of knowledge of the married state, because "Woman and the New Race" contains the knowledge you must and should have.

PART OF CONTENTS

Woman's Error and Her Debt	Continence: Is It Practicable or Desirable?
The Struggle for Freedom	Contraception or Abortion?
Two Classes of Women	Are Preventive Means Certain?
Immorality of Unwanted Large Families	Battalion of Unwanted Babies Cause of War
Cries of Despair	Woman and Morality
Women Who Plead for Abortion	Legislating Woman's Morals
When Should a Woman Avoid Having Children?	Why Not Birth Control Clinics in America?

Any one of the above chapters alone is worth the price of the book.

THE KNOWLEDGE IS PRICELESS

This book, "Woman and the New Race," by Margaret Sanger, contains so much that is vital, thorough and necessary to every married couple, that it would require a book to explain it. The knowledge between its covers is priceless.

Send \$2 today for "Woman and the New Race," and if you are not satisfied it is worth its weight in gold we will refund your money. Order before this first edition is exhausted and the price advances—while we still have the privilege of sending it to you, order direct.

NEW YORK, N. Y.

A 1921 ad for *Woman and the New Race*, Margaret Sanger's advocacy of contraception, warns: "If you fail to read this book do not ever complain of an unhappiness that may be yours, resulting from the lack of knowledge of the married state."

a sharp rise in population. This data was used to promote a Malthusian argument for birth control as a remedy for controlling spiraling demographic growth. Nationalist advocates of birth control were also quick to draw a connection between national poverty and size of the nation's population. None of the early advocates of birth control called for resource redistribution to alleviate national poverty,

however. Interestingly enough, Mohandas Gandhi, who strongly opposed the use of any chemical and mechanical contraceptive device, appears to have been one of the first to call for resource redistribution as a solution to India's growing population problem. He was strongly opposed to birth control on moral and philosophical grounds, and debated with Sanger on the subject in 1936.

Indian feminists such as Kamala-devi Chattopadhyay joined Sanger and Stopes in making a case for birth control as a means of improving women's maternal health. Lower maternal and infant mortality figures, it was argued, were important indicators of national well-being. Birth control activists also argued that lower fertility figures were a sign of modernity, especially for non-Western nations, which were seen to have higher fertility figures than Western nations such as France and Canada. Fertility figures in France and Canada had been declining from the late nineteenth century onwards, which led to a strong opposition to birth control in those countries.

Tension between Rhetoric and Technology

Examining the writings of the various advocates of birth control might leave one with the impression that they had something concrete to offer in terms of contraceptive technology. On closer examination, however, it seems that the international birth control movement was long on rhetoric but short on technology, especially before the invention and testing of the contraceptive pill in 1960.

In the period between 1930 and 1950 birth control activists greatly differed among themselves about the most appropriate contraceptive technology. Sanger and Lydia DeVilbiss were promoting a spermicidal douche powder that had been tested in Britain. The powder was in use in some of the southern states in the United States. It was marketed in India too. There were complaints against the powder, however; in India women complained about vaginal irritation and also about the difficulty in using this method given the lack of privacy in their working-class homes. In the face of these complaints, Pillay recommended condoms as the most reliable form of contraceptive. Stopes, in the meantime, claimed that she had discovered the ideal method for working-class women of London and for poor women in India and South Africa. The method Stopes was promoting was a cotton waste pessary dipped in olive oil. This method was not endorsed by Indian doctors and advocates.

In India, practitioners of Ayurveda, a traditional Indian system of medicine, advertised their products in vernacular magazines such as *Madhuri* and *Sudha* in the 1930s, while biomedical journals such as *The Indian Medical Gazette* carried advertisements for various commercially marketed contraceptives. Most of these advertisements provided addresses of local chemists who carried these products, but some advertisements in Indian medical journals gave only a London address, which indicates that birth control technologies circulated globally and that consumers shopped in a global market. But it should also be pointed out that consumers of these global products, especially in countries such as India, were primarily members of social and economic elites who could afford to pay for the product and its international postage cost.

Counter-Histories of Birth Control

In the late twentieth and early twenty-first centuries, scholars shifted their focus away from celebrating the work of birth control pioneers and have begun examining how this work was experienced by less powerful social and economic groups in different countries. Native American groups in the United States have spoken out against contraceptive technologies, which they argue have been used to police their sexuality rather than to empower native women to make informed reproductive choices. The history of the birth control movement in India has brought to light the call of the Indian feminist leader Begum Hamid Ali for the sterilization of the "unfit" in her enthusiasm for controlling India's population. Likewise Puerto Rican scholars tell a sad history of Puerto Rican women who, without knowing and without giving consent, became the guinea pigs used for testing the contraceptive pill in the 1950s. And there are at least two sides to the story following the more widespread and regulated introduction of the pill in the early 1960s. For some it is regarded as one of the more significant medical achievements of the twentieth century. Oral contraception is thought of as playing a significant

role in the women's liberation movement, particularly in regard to the sixties' era of greater sexual freedom. At the same time the pill brought with it considerable controversy in respect to side effects and ongoing health concerns and, no less significantly, debates surrounding sexual promiscuity and teenagers taking the pill. These revisionist histories force us to examine the real human costs that underwrote the efforts to manage human fecundity.

Future Agenda for Reproductive Health

Feminist scholars working on reproductive health issues are constantly asking themselves what the future agenda for reproductive health should look like. Feminist researchers, policy makers, and activists all agree that the success of contraceptive technology in the future will lie in democratic approaches, attentive to local needs and beliefs, seeking to empower women in making informed choices.

Bolívar, Simón

(1783–1830)

SOUTH AMERICAN LIBERATOR

Simón Bolívar's aristocratic background, education, and his Grand Tour experience in 1799 resulted in his exposure to European revolutionaries in the early days of the Napoleonic era; in 1805 he made an oath to free South America from Spanish rule. He achieved his goal twenty-one years later, after failed attempts, exile, and a decade of war, thereby earning his title of "Liberator."

Simón Bolívar, the future Liberator of South America, was born to an aristocratic Creole family with extensive property surrounding Caracas in 1783. His parents had dramatic personalities (his father was a notorious womanizer and his mother managed the family estates aggressively), but Bolívar was orphaned at a young age, and the person who had the greatest impact on him as a child was a slave woman named Hipólita, by whom he was raised in his uncle's house and for whom he retained fond feelings throughout his life. He was a handsome, active boy, doted upon by his sisters and other female relatives. Young Simón was not a diligent student; he preferred an athletic life in the wild outdoors to time spent in a library with his tutors. Nevertheless, he was clever and received the best education that his family's wealth could provide and his disinclination to study would allow.

Bolívar's most influential teacher was Simón Rodríguez, an unorthodox freethinker who later became famous for his translation of Chateaubriand's *Atala* and for teaching anatomy to his students in the nude. In 1799, Rodríguez took his impressionable young charge to Europe for the typical gentleman's Grand Tour to complete his education. In Madrid, he was invited to play badminton with the future

A portrait of Simón Bolívar, known as the Liberator of South America, painted in 1883 by Martín Tovar y Tovar. *Historia de Venezuela en Imágenes*, El Nacional, 2001.

King Ferdinand VII; recalling the accident in which he accidentally knocked off his opponent's hat, Bolívar later mused, "who would have prophesied . . . that

this was a sign that one day I might tear the costliest jewel from his crown?" (Worcester 1977, 8). Teacher and student moved on to Paris where they spent much time in the salon of the infamous Fanny du Villars. It was the early Napoleonic era and when Bolívar and Rodríguez met with naturalists Alexander von Humboldt and Aimé Bonpland, they spent much time discussing the destinies of great men and the revolutions they make. In 1805, at Monte Sacro in Rome, Bolívar took a symbolic oath that he would liberate his countrymen from the Spanish yoke.

In 1806, Bolívar returned to Venezuela via the United States. He traveled with his new wife, a beautiful young Spanish girl named María Teresa Rodríguez del Toro. By all accounts he was devoted to her and was devastated when she died of typhus shortly after her arrival in Caracas. Although he had many subsequent relationships with women, Bolívar never married again and left no children. Instead, he turned his attention to local politics and accepted a position as the lieutenant chief justice of the Yare Valley. In 1810, when a constitutional crisis opened the possibility for Spanish-American *cabildos* (town councils) to seize temporary powers to rule in the king's name, Bolívar sensed that his historical moment had arrived. He went to London as a member of the three-person delegation hoping to secure British military protection for the Caracas junta and perhaps some sort of political recognition as well. Those goals may have proved too optimistic, but the brief time Bolívar spent in London initiated a devotion to British-style aristocratic reformism and constitutional monarchy that lasted for the rest of his life.

Bolívar was twenty-seven years old when he returned to Caracas in September 1810. He was a charismatic figure whose intellectual training and vast fortune ensured that his voice would be heard in the deliberations over the momentous decisions facing his country. In the beginning, Bolívar was willing to serve as a commander under the more experienced General Francisco de Miranda when the inevitable Spanish royalist counterattack began; by 1812, however, Bolívar had started to doubt the older man's competence. In a highly controversial episode, Bolívar's

garrison surrendered to the royalist Monteverde's forces and Miranda was taken captive. Bolívar's detractors see this a betrayal of both the Republic and a personal betrayal; Bolívar himself saw it as a patriotic act that saved his countrymen further bloodshed from Miranda's disastrous leadership. With the First Venezuelan Republic (1811–1812) in ruins, Bolívar and the rest of the patriotic leadership fled to exile in New Granada and islands in the British Caribbean with rulers sympathetic to his cause.

In 1812, Bolívar wrote his first significant political treatise, the Cartagena Manifesto. In 1813, he declared "war to the death" against the Spanish presence in South America, wholly dedicating his life and energies to the cause; he declared the Second Republic and took the title of *Libertador* (Liberator) for himself. What followed was a decade-long brutal civil war that pitted members of important families—including Bolívar's own—against each other. In 1816, Bolívar wrote another famous tract, known as the Jamaica Letter, while he was trying to gather men and material for an expedition to Venezuela. He sailed past Haiti, where he received further assistance from the mulatto leader Alexander Pétion in exchange for a promise to abolish slavery in the future Venezuelan republic. Bolívar's multinational forces eventually included a large group of British soldiers, known as the Irish and British Legions, and a homegrown band of fierce plainsmen known as the *llaneros* under the command of José Antonio Páez.

Bolívar's forces invaded the mainland in 1817 and made slow but steady advances. By 1819, they had secured a large part of the Orinoco delta and had set up a patriot headquarters at Angostura. Under Bolívar's watchful gaze, his partisans called a congress to declare the Third Republic, write a constitution, and declare the Liberator to be the first president. The Angostura constitution provided for separation of powers and many other liberal measures influenced by the United States, Britain, the Cádiz Constitution of 1812, and the Greek and Roman classical heritage. Now confirmed as a legitimate head of state, Bolívar pressed onward to two decisive victories over the royalists at Boyacá

Judgment comes from experience, and experience comes from bad judgment. • **Simón Bolívar** (1783–1830)

(1820) and Carabobo (1821). Shortly thereafter, the independence of northern South America was guaranteed in a formal capitulation and the Congress of Cúcuta created the Republic of Gran Colombia. Always restless, Bolívar could not bring himself to stay in one place and govern while Spanish forces remained on the continent; he left Gran Colombia in the care of his vice president, Francisco de Paula Santander, and headed westward to join in the liberation of Peru. After their fateful meeting at Guayaquil in 1822, Bolívar's only hemispheric rival, Argentine general José de San Martín, went into self-imposed exile and the Liberator emerged as the towering hero of the continental independence movement. By 1826, the last remaining royal strongholds fell and the grateful former Peruvian province adopted a new name, Bolivia, in honor of its liberator.

Simón Bolívar had accomplished his life's goal. He enjoyed unimaginable popularity as the Liberator of a continent, but the territories quickly proved ungovernable. Racial tensions worsened when the patriots did not emancipate the slaves immediately as they had promised. Regional jealousies quickly surfaced and there was growing hostility between those who favored a decentralized federal system and those like Bolívar who increasingly wanted a strong centralized authority to deal with the unrest. His enemies quickly depicted him as a closet monarchist, intent on securing an American crown for himself. In the late 1820s, he survived a series of assassination attempts, one time by jumping out of a window while his would-be murderers were at the door.

He grew increasingly pessimistic and planned to leave for England. Before he could depart, however, an exhausted Bolívar succumbed to tuberculosis in December 1830. His legacy is vast. Not only did Bolívar inspire the independence movements of

northern South America and use his considerable military skills to defeat the Spanish forces throughout the region, he conceived of a continental system that was the forerunner of modern Pan-Americanism. He has achieved iconic status throughout the Americas, and has lent his name to two South American republics (Bolivia and the Bolivarian Republic of Venezuela) and one national currency.

Bows and Arrows

For millennia before the invention of guns and gunpowder, bows and arrows were the most efficient human instruments for killing at a distance. Their advantage was so great that bows and arrows spread across the Old World, with innovations across cultures, from the undetermined place they first appeared, and were still expanding southward in the Americas when Columbus arrived.

Arrowheads, found scattered across most of the Earth, count as one of the most common objects of archeological significance, outnumbered only by broken bits of pottery. It is easy to imagine how an arrow aimed at a distant human enemy or hunted animal often missed its target and got lost to remain undisturbed in its lodging place for uncounted centuries, only for us to find it by chance. But isolated arrowheads, separated from other human artifacts, are usually impossible to date and tell us little or nothing about who made and used them.

A few rock paintings of bowmen running and shooting in North Africa and elsewhere show that as much as 10,000 years ago archery had come to dominate local warfare. And again it is not difficult to see why that was so, for a weapon that can wound or kill at a distance of up to hundred yards far out-ranged older projectiles, and the peoples who first possessed them could attack others with impunity. So once lethally powerful bows and arrows were invented—wherever and whenever that may have occurred—they were bound to spread, and did so throughout Eurasia and Africa, before carvings and written records began to supplement sporadic, undated arrowhead finds.

Uncertain, Ancient Origins

Next to nothing can be said of how bows became so powerful. They must have been invented somewhere in Asia or Africa, and sometime between about 30,000 and 15,000 years ago. They may have been derived from small, soft-strung bows used to twirl a fire drill (a pointed stick) fast enough to start a flame: by wrapping the bow string around the stick, pressing the point against a block of wood and then pulling the bow back and forth quickly, the heat of friction ignited a pile of specially prepared dry tinder. But far bigger bows, resilient enough to launch lethal arrows, were much harder to construct than the small and weak bows needed to twirl fire drills.

These large bows needed to be symmetrically shaped and made of tough, resilient kinds of wood able to bend and then spring back into shape time and again. Strings strong enough to bend such bows must have been even harder to make and fasten securely to the tips of the bow, since they had to withstand repeated tests of sudden high tension and instantaneous release. Arrows that could fly straight were almost as difficult to fashion. Attaching stone heads to wooden shafts firmly, and arranging suitably trimmed bird feathers at the rear to assure a smooth path through the air, required precise skill, as well as strong glues and/or some sort of slender binding material.

It may have taken many centuries for humans to solve all the problems of making such bows and arrows—and even when they knew how, it was never assured that people living in different regions and climates of the Earth would find suitable raw materials. But as soon as these formidable weapons did

Jean Baptiste Debret (1768–1848) illustrated this assortment of Brazilian arrows and other spear-like weapons labeled in French as *armes offensives*.

appear, neighbors immediately needed them too for self-defense; without bows they were liable to speedy extermination by those who did have them.

Innovations across Cultures

It is also clear that improvements in the design of bows did not cease. In particular, bows made only of wood, which remained usual in most of the world, were overtaken by more complicated compound bows as early as 2200 BCE in Mesopotamia, where a stone carving shows an Akkadian king carrying a shortened bow with the distinctive shape associated with the compound bows that later generations of steppe nomads used with great effect. Compound bows were cunningly constructed of wood, bone,

and sinew to increase their resilience and power. They had the additional advantage of being short and easy to use on horseback, so these powerful bows remained the supreme weapon of Eurasian steppe warriors until infantry guns matched and surpassed them after about 1700 CE.

Even more efficient (and far more difficult to manufacture) were cross-bows, invented in China about 350 BCE; they were cocked by using both hands (later by winding a winch) and released by using a trigger. The winch could bend stiffer bows (eventually made of steel) and fired short, metal arrows that could penetrate most forms of armor. But cross-bows needed metal parts for trigger and cocking mechanisms, and except in China, where large numbers of infantrymen used them against

invaders with considerable success, they never became very numerous.

Within Eurasia and Africa, bows and arrows assumed different societal roles. As Homer's *Iliad* makes clear, ancient Greeks thought that archers were cowardly because they did not expose their bodies to the risk of wounds and death in hand-to-hand combat. With some exceptions Europeans long preferred spears and swords to bows. So when Catalan cross-bowmen handily defeated French knights in Sicily (1282), and when English (often Welsh) bowmen shot down French knights during the Hundred Years' War (1338–1453), their successes shocked the upper classes of western Europe.

On the steppes, however, bows dominated hunting and warfare from the time riding on horseback became common (by 350 BCE), and since horsemen had the advantage of superior mobility, they often conquered civilized peoples to the south and made their style of warfare normative through most of Asia. The Chinese relied mainly on infantry archers to defend fortified cities and landscapes, while Japanese fighting men, like Europeans, honored face-to-face sword combat more than archery.

Ancient Egyptian armies used bows and chariots like those of Mesopotamia, but too little is known about sub-Saharan Africa to allow historians to say anything in detail about the use of bows and arrows for warfare and hunting in that part of the continent.

The Naram Sin stele, now at the Louvre, shows an Akkadian king (c. 2200 BCE) carrying a shortened bow. Its distinctive shape is associated with compound bows used to great effect by later generations of steppe nomads.

We do know that Australians never learned to use bows before Europeans arrived, but in the Americas bows showed up in Alaska among Inuit peoples sometime between 100 CE and 500 CE, and soon spread southward among Amerindian tribes.

Very likely it was the arrival of bows and arrows that compelled salmon fishers along the Pacific coast to gather together into large villages for protection about 500 CE, and the disappearance of the Hopewell peoples, who built elaborate ritual mounds in the Ohio River valley between about 500 BCE and 500 CE, may have been due to harassment by peoples from the north equipped with bows and arrows. At any rate,

when large so-called Mississippian settlements appeared at Cahokia, Illinois, and elsewhere after 800, they were defended by elaborate earthworks and palisades designed for protection against arrows. Simultaneously, Toltecs and their Chichimec allies introduced bows to Mexico, but subsequently Aztec warriors rejected them, since they waged war mainly to capture prisoners whose hearts they would offer to the sun god to make sure of divine favor.

In most of South America bows remained unknown when Columbus arrived. But Arawak tribes living along the northern coast of the continent were then using bows and arrows to attack Taino inhabitants of the Caribbean islands—a process interrupted by the arrival of Spaniards who, backed with superior weapons, hastened the Tainos' extinction by bringing novel but lethal diseases onto the scene.

If the invention and spread of bows and arrows profoundly changed human

European merchants supply the best weaponry, contributing to their own defeat. • **Saladin (c. 1137–1193)**

An interest in archery throughout the years spurred some Boy Scouts to make their own bows and arrows. Photo taken during the 1929 Boy Scout anniversary week, 8–14 February.

affairs, what about their effect on animals? The impact of a weapon that killed at a distance upon animal herds is wholly unrecorded, and can only be imagined. Prey animals had to learn to fear and flee from human beings whenever they sensed their presence, and at first, when bows were new, kills must have become far easier. How quickly animals became more wary, making human hunting more difficult again, is unknowable but may have been quite quick. At any rate, no major extinctions can be attributed to bows, for humans had been capable of using spears to extinguish unwary game animals on islands and in the Americas long before bows extended the range of their power to kill.

British East India Company

Stockholders formed the English East India Company (later the British East India Company) to import Asian goods by sea. With a monopoly enforced by the British crown, the company governed its trading posts, waged wars, and even conquered India, in order to protect its interests. A massive revolt in India caused the British government to take control of the country and dissolve the company in 1859.

The English East India Company was a British trading company, responsible for the import of Asian goods, expanding English and British interests in Asia, and conquering India. The company was dissolved in 1859 when the administration of India passed to the British government.

The English East India Company was created as a stockholders' company in 1599 and granted monopoly for trade with East India in 1600 by Queen Elizabeth. The British initiative followed the successes of the Dutch East India Company and Portuguese traders that imported Asian goods by sailing around the horn of Africa, surpassing the traditional caravans. The seventeenth century was marked by intense competition and frequent battles between the European companies.

Main products from Asia in the seventeenth century were pepper and spices, which demanded a high price per quantity in the home market. However, a successful voyage demanded planning, strong support, and patience as it took about two years to be completed. Dangers faced by the traders included storms, tricky waters, pirates (especially European competitors), and diseases, which combined to regular losses of sailors and ships. Consequently, state

backing and shareholders who could afford to wait for returns on their investments were essential, while the final rewards were significant.

From the 1640s cotton and silk cloth became important trade objects. Most cloth was from India, though calico patterns, popular in Europe for their aesthetic and exotic quality, were actually patterns adjusted to European taste. By 1700 the English East India Company clearly controlled the European market for Indian cloth, with annual imports approaching one million pieces of cloth. The imports led the English textile industry to protest against foreign competition and a law was enacted allowing only raw silk imports, rather than silk cloth, to secure work for English silk weavers. The law had little effect on the company, as much of its market was in continental Europe, unaffected by the English law.

During the seventeenth century trading activities were based from relatively small trading stations, or factories, such as Bantam in Java and Madras in India. These provided a steady settlement in which expatriate employees could worship freely, as Christians for example, and rule by their own laws in agreement with the local rulers. A noticeable exception was China, which, except for the Portuguese in Macao, did not allow foreigners a permanent base, demanding all trade to be conducted through Chinese middlemen responsible for adherence to Chinese rules.

From around 1750 the (now British) East India Company increasingly participated in Indian politics, leading to its conquest of India. It is debated whether conquest was intended from the start, or if it was the unintended consequence of interfering in Indian politics in favor of regional stability for the sake of company trade, but once conquest started,

The British East India Company's emblem, printed on silk backed with paper, bears the motto (translated from Latin): "By the Command of the King and the Parliament of England." New York Public Library.

the company rapidly gained control over parts of India as the ruling Mughal Empire weakened. Most company expansion resulted from local authority being threatened by the Marathas, a major people from the western coast of India whose main families joined in the Maratha confederacy in the eighteenth century and aimed to expand Maratha power at the expense of the weakened Mughals. The company offered armed aid and as reward received land, titles, and influence. Consequently, the company gained control and authority as local rulers became increasingly dependent on it. This process continued until its culmination in 1818, when most of India was under direct or indirect company control. This is a prime example of "reluctant empire," imperial expansion run by private companies, not government policies.

The company ruled India as a military state, organizing a rigid interpretation of Indian traditions and caste, creating an inflexible social system. Apart from trade, a process of attempted Anglicizing began with an influx of Christian missionaries and English values. Among the customs attacked was suttee, the burning of widows; however, the British attempt associated suttee with the higher classes, and thus it became desirable to the lower classes. Other attempts to

strengthen the position of women against "barbaric" traditions had similar effects.

Economically, the industrial revolution in Britain ruined the Indian textile industry in the 1820s and made the company focus on new areas of trade, chiefly opium sold to China. This led to the Opium Wars from 1839–1842 and 1856–1860, which forced China to open up to unfettered British trade. However, opium did not cover the total of the British imports from China, and to cover the deficit, silver from India was used to balance the trade. During the same period, the British parliament abolished the company's monopolies on trade to India (1813) and China (1833).

In 1857, millions of Indians rose in revolt in the Great Mutiny. As a consequence, the British parliament decided to take over the government of India from the company in 1859, ending the East India Company's period as rulers of an empire and leading to its complete abolishment.

British Empire

Britain played a major role in the globalization of world trade in the seventeenth and eighteenth centuries, as well as in the Industrial Revolution in the eighteenth and nineteenth centuries, and thus exerted an unprecedented amount of power in different parts of the world well into the twentieth century. Nevertheless, the empire became difficult to maintain due to financial woes and the rise of the United States as a global power.

At least five British empires rose and fell between the early seventeenth century and the beginning of the last one-third of the twentieth century. These empires were in different parts of the world and were run on different principles. The one constant was Great Britain's disproportionate ability to project its power abroad. Although none of the five empires remains, their power is still felt in the wide extension of the English language and of the Anglo-American legal tradition around the world.

Sources of British Power

When most societies were still in the second stage of human development (farming), British society entered the third stage (urbanization, world trade, and industrial development).

No longer were the British limited to what their arable land could produce. As in most countries, the farms and forests had provided the foodstuffs, textiles, building materials, means of transport (in the form of horses and their fodder), and burnable fuel. To an ever greater degree as the eighteenth century progressed, however, the British could meet each of these basic economic needs through massive imports—and in the case of building

materials, transport needs, and fuel, major parts of the needs could be met through mining, without taking up any arable land in Great Britain or abroad.

Great Britain's ability to free much of its labor force from the land and shift it into trade and manufacturing allowed for the projection of British power to the ends of the Earth. By 1800 the British navy ruled the waves. The profits and raw materials that poured into the British Isles because of Great Britain's unique place in international trade accelerated the modernization of the domestic marketplace; this modernization in turn further magnified British power.

The First Three British Empires

Great Britain's first empire flourished during the seventeenth and eighteenth centuries. The East India Company was given its Royal Charter and its monopoly on trade with India in 1600. Imperial expansion in India long took the form of coastal trading posts called "entrepôts" or (in an old-fashioned sense of the word) "factories"—where the factors of production (from trading goods to stockpiles of food and materials for repairing ships) were warehoused in areas leased from local powers. The entrepôts also contained the offices and homes of local European agents and native legal experts, translators, and go-betweens (called "compradores," from a Portuguese word). From these entrepôts the East India Company acquired local influence, especially in those areas of India where the East India Company provided weapons or soldiers-for-hire for Indian governments. But no large-scale settlement of British people took place in India.

At the same time, settlement colonies had been established in Virginia in 1607 and Massachusetts Bay

Nassau, capital of the Bahamas. Granted to Britain in 1629, the Bahamas succumbed to Spanish, pirate, and American attacks in the seventeenth and eighteenth centuries until being restored to Britain by the 1783 Treaty of Versailles.

in 1620. Through the Committee on Trade and Plantations (a committee of the Privy Council), the British government tried to maintain a policy of mercantilism, buying only raw material from the colonies and allowing them to buy their finished goods solely from the mother country. This arrangement was designed to maintain the flow of precious metals into Great Britain. Indeed, some evidence indicates that the captive market for British manufactures that was the eastern seaboard of North America may have helped to give the British economy its push into full modernization.

Meanwhile, France's rival imperial tradition was destroyed in the Seven Years' War (1756–1763, called in the United States the “French and Indian War”), which was fought largely over trading opportunities. The British victory stripped the French of their North American colonies and their position in India. The French revenge was to bankroll the American Revolution against the British (1775–1781), a war fought over the tax and mercantile policies that were stifling colonial development. (French support for America's successful revolution, in turn, helped bankrupt the French state and prepared the way for the French Revolution that began in 1789.)

With the loss of the American colonies and the step-by-step expansion of British military and political control in India, British imperial attention turned to India itself and the slave-worked sugar plantations of

the Caribbean. Thus began the second British Empire, which lasted from the 1780s to the 1830s. It coincided with the beginnings of the Evangelical Movement—the development of a more personally committed, morally stringent form of Protestantism than the Anglican Church of the eighteenth century had been providing for its adherents—and the rise of mass middle-class political involvement within Great Britain. Many people, having it better than ever before, looked around them and found to their shock that many other people were being ground into the dust. Robert Clive and Warren Hastings, two East India Company Governors' General in India, were questioned by Parliament in London over how they had enriched themselves at the expense of the Indian people. Clive committed suicide in 1774 and Warren Hastings was impeached in a major state trial that lasted from 1787 till 1795—at which point he was acquitted. Meanwhile the military conquest of whole Indian provinces continued.

The first great middle-class reform movement after the expansion of the voting franchise among the richer sectors of British society in 1832 was the abolition of slavery in the British Empire in the 1830s (the original act abolishing slavery, later modified, was passed in 1833). The result of abolition was to permanently injure the economies of the sugar islands of the Caribbean—and make England a more humane nation.

The greatest loss for the British Empire turned out to be their 1781 surrender to the Americans at Yorktown.

SURRENDER AT YORKTOWN.

Another result was the third British Empire. The Caribbean was now of only marginal concern. The focus shifted to a new set of settlement colonies, so that mid-nineteenth-century England exported its parliamentary procedures (although usually on a more democratic franchise) to Australia, New Zealand, and southern Africa (the first two countries had been claimed from nonwhites in 1788 and 1840, respectively; southern Africa, originally Dutch, had been taken from the French emperor Napoleon as a stopover on the way to India).

Self-governing institutions were in place in most settlement colonies by the end of the 1850s. Yet smaller outposts, and those without many European settlers, did not have such institutions. In no two colonies were the institutions the same. Until 1859, furthermore, India was the possession of a private company that was merely under British government regulation. In short, no imperial “system” existed, merely the Colonial Office (and after 1859 the India Office), which sent out governors and reviewed local regulations or laws. Rather than any imperial system, instead a diverse imperial heritage existed.

The Fourth and Fifth British Empires

By the late nineteenth century Great Britain’s economic superiority was being lost to competition from the

newly industrializing areas, chiefly continental Europe, North America, and Japan. Still, the British retained two key advantages. First was the city of London, the world’s financial center. The city was the source of England’s continuing balance-of-payments surplus (in the form of the profits on “invisible” financial dealings) long after England was running a trade deficit in tangible goods. Second was England’s head start in developing a disproportionate, superpower-scale military establishment, with a worldwide network of coaling stations and a tradition of imperial and military service among the upper and middle classes.

The fourth British Empire was the result of the scramble among Great Britain, France, and the newly Unified German Empire, among others, for Africa (and other tropical colonies) during the 1880s and 1890s. During the twentieth century many people assumed that Great Britain had seized these colonies in order to make money. But modern scholarship suggests that it was never profitable to administer the interior of Africa or isolated islands in the South Pacific. Three other explanations exist for the scramble for Africa, or at least for Great Britain’s share in the scramble: (1) the desire to freeze out other European powers or to avoid being frozen out by them; (2) the recurrent instability of frontiers with less-developed, less-industrialized societies; and

(3) the wish on the part of governments for cheap victories to impress the newly enfranchised common people (four-fifths of British men could vote after 1884–1885).

The fifth (and final) British Empire was what was gained through League of Nations mandates during the twentieth century. The British took these mandates, such as Palestine, and yet after the Second Boer War (1899–1902), many British people doubted the justice of Great Britain's imperial activities.

Imperial affairs after 1918 were dominated by the questions of how and when Indian independence would come (it came in 1947). The status of the white settlement colonies was also a question (namely Canada, a federation since 1867; Australia, federated in 1901; the Union of South Africa, set up as a federation under the rule of the defeated Afrikaans-speaking Boers in 1910; New Zealand, which had governed itself since the 1850s; and eventually Ireland—after the 1921 Anglo-Irish Treaty). The other powers at the Versailles Peace Conference (ending World War I) in 1919 had denied

that any of these colonies were independent states. The representatives of the colonies had to sign the Versailles Treaty not as independent powers but underneath the British signature, and with an indentation to show that they were subparts of the British Empire.

The Statute of Westminster in 1931, which created the British Commonwealth of Nations, granted full independence and the right to maintain independent international diplomatic relations to self-governing colonies. Under the Statute of Westminster, government by a local parliament with a prime minister who effectively chooses the monarch's representative (the governor-general)—a model that had originated in the mid-nineteenth century—was now formalized. Under this model the newly independent states that left the British Empire during the 1950s and 1960s were organized, although many of these states would soon abandon their British-style constitutions and the institution of governor-general in favor of their own presidents. These states nonetheless tended to remain members of the Commonwealth, whose head was the British monarch.

Ideologies of British Imperialism

The British nawabs (rulers) who, working for the East India Company, ruled India during the late eighteenth century maintained no pretense that they were in India for any noble purpose or that they had any cultural superiority to the Indians. The nawabs were there to make money, and on those frank terms they mixed equally in the wealthier reaches of Indian society. Many cross-cultural marriages and affairs occurred.

After the Evangelical Movement in the first one-third of the nineteenth century had accustomed the British to asking themselves the moral groundings of their actions—and after the violent suppression of the Indian “Mutiny” of 1857–1858—people developed the idea of a British mission to bring order and economic progress to peoples who, it was now assumed, would kill each other without the pacifying hand of British oppression. The British rulers stopped mixing with the Indian ruled and developed a self-image of stoicism and suffering.

In Great Britain itself the spread of literacy and education during the mid-nineteenth century led many people to ask why their country was in front of the world in so many ways. That Great Britain was in front of the world was plain to see from the halls of the Great Exhibition (1851): half the products on show were from one island off the northwest coast of Europe, and half were from the rest of the world, combined—and this was a fair sampling of who was producing what.

The English philosopher John Stuart Mill (*On Liberty*, 1859) and others looked to the economic effects of English political freedom for an explanation of Britain’s global power. After publication of the English naturalist Charles Darwin’s *The Origin of Species* (1859), however, many writers began to work out ideas of racial or biological superiority. Later generations simply took British power and racial superiority for granted. The statesman Winston Churchill, for example, stayed loyal throughout his life to his sentimental attachment to the Empire that had painted all the schoolroom maps “British Empire Red.” As he wrote his associate Anthony Eden in 1944, “hands off

the British Empire is our maxim and it must not be weakened or smirched to please sob-stuff merchants at home or foreigners of any hue” (Cain and Hopkins 2002, 628).

After World War II, fewer British people would share this view. British Prime Minister Harold Macmillan, in his “Winds of Change” speech in South Africa in 1960, proclaimed the coming of African independence—which had actually become inevitable with Great Britain’s U.S.-mandated withdrawal from Suez in Egypt in 1956. In an egalitarian age, Great Britain found itself the junior partner of the new superpower, the United States, which was against British imperialism. Plus, for some time after World War II Great Britain was financially strapped. For both reasons, the British Empire could not be maintained. Most of the colonies were given their independence by 1970. Except for the Falkland Islands and a few other outposts (the largest in population, at 65,000, is Bermuda, a colony since 1609), the empire of the world’s first industrial country has ceased to be—although it continues to exert its cultural influence in a world dominated by the English-speaking powers and the English language itself.

Empire of the English Language

After 1492, when newcomers from the Old World found themselves in the New World among natives who had not been exposed to the diseases of the Old World of Afro-Eurasia—Africa, Eurasia, and their environs—the natives tended to die in large numbers, often with the active help of the newcomers (as in the case of the cholera-infested blankets given to the native North Americans during the eighteenth century and the random shootings of Australian Aborigines during the nineteenth). The population of the New World was reduced by 90 percent during the thirty years after 1492 and by 50 percent in the remainder of the population during the ninety years after that. During the nineteenth century the population of Tasmania disappeared completely.

Thus, ample room for British settlers seemed to exist. They included poor people looking for a better life, but

One day the war will be over. And I hope that the people that use this bridge in years to come will remember how it was built and who built it. Not a gang of slaves, but soldiers, British soldiers, even in captivity.

• Sir Alec Guinness (1914–2000) as Colonel Nicholson in *The Bridge on the River Kwai*

they also included involuntary settlers, people whose sentences of death were commuted to transportation (a practice abolished in 1868). Room also existed for carefully selected poor families, who were offered subsidized fares in order to create socially balanced colonies and to remove the poor from Great Britain itself. This form of social engineering was most strongly advocated in the writings of the English colonialist Edward Gibbon Wakefield, starting with *A Letter from Sydney* (1829). Settlers cheated the natives out of their land and fought battles with them when cheating would not work (as in New Zealand in the period stretching from the Treaty of Waitangi in 1840 through the Maori Wars of the 1860s). In Australia, cheating the natives with unequal or broken treaties on the New Zealand (or North American) model was not necessary, for the Australian settlers denied that the natives had the cultural or human worth to own land at all; land was simply taken without formality or fuss.

Until the abolition of the slave trade in the British Empire in 1807, slaves were dispatched around the world at British command. During the nineteenth century Chinese “coolies” and Indian peasants were similarly dispatched. These slaves and peasant workers contributed to the repopulation of much of the world by peoples of Afro-Eurasian stock. This result is visible in today’s United States, Canada, Australia, New Zealand, Fiji, and the Caribbean.

The importance of these resettled countries, seen together with the British-influenced countries of South Asia and Africa and with the continuing importance of the United Kingdom and the Republic of Ireland, has led to the domination of the English language in world trade, mass media, and science, at least since the beginning of the twentieth century, when English eclipsed French in diplomacy.

On the other hand, the African interior, which had already been weakened by centuries of slave-trading, was deliberately subordinated to the Western economic system in the early and middle twentieth century—through the imposition of taxes that could be paid in British currency and earned in British-controlled factories and plantations. Meanwhile the plantation economies of the British Caribbean, of

much of Africa itself, and of many Pacific islands, were trapped in a boom-and-bust cycle that prevents a society from moving beyond poverty. This cycle characterizes those societies that function economically as the specialized exporters of raw commodities rather than of manufactured goods. Many societies are overly specialized in this way largely because of the activities of the traders and planners of the period of British overlordship.

Buddha

(TRADITIONALLY DATED C. 566–C. 486 BCE;
MORE PROBABLY C. 463–C. 383 BCE)

FOUNDER OF BUDDHISM

Buddha (Siddhartha Gautama) was born an Indian prince. His followers made him into a god, but in his lifetime he was much like other holy men of India. Buddha's influence increased as his devotees, seeking to live their lives in monasteries according to Buddha's example of wisdom and compassion, persuaded lay people to support them by donating land and other forms of wealth.

Siddhartha Gautama discovered and taught a path of liberation from suffering that has shaped the lives of Buddhists across the world for over two thousand years. He presented a vision of human existence that centers on wisdom and compassion, and he established monastic communities for both men and women in which intense meditation has been practiced for centuries. He advised kings and nobles on governing wisely and set forth precepts for lay people that continue to shape lives around the globe. For over two millennia, his life and teachings have had a profound impact on religion, culture, and history in central, eastern, and Southeast Asia; and since the nineteenth century many in Europe and the United States have been moved by his vision.

Siddhartha Gautama was born into a ruling family of the Sakya clan in present-day Nepal. The first written sources for his life, the texts of the Buddhist canon in the Pali language, come from long after his death and include legendary motifs, and so there is doubt about how reliable they are. At about the age of twenty-nine, he became dissatisfied with life at the court, saw that life as ordinarily lived is unsatisfactory, and embarked on a religious quest to find a way out of suffering. He studied with Hindu masters, but their wisdom and meditation practices did not provide

the answer he was seeking. Meditating in solitude, he underwent a transforming enlightenment at age thirty-five, and his followers acclaimed him as the Buddha, “the awakened one.” Because there are many Buddhas in the Buddhist tradition, Gautama is often referred to as Sakyamuni Buddha, the sage of the Sakya clan..

The Buddha expressed his insight in the Four Noble Truths, which are at the heart of Buddhist life and practice and are his central contribution. The First Noble Truth is that life as usually experienced is unsatisfactory because it is impermanent. All pleasures are transitory, leading to separation and suffering. The Second Noble Truth is that the unsatisfactory character of life arises from craving and grasping at impermanent objects and experiences, seeking lasting pleasure and security that these objects and experiences cannot provide. Ordinary life is marked by a fundamental illusion that there is a permanent, substantial self underlying our experiences. The Buddha taught that there is no such enduring self. All things, including humans, are composites of various factors that constantly change and that are profoundly interdependent. Whatever arises will cease to be.

The Third Noble Truth is the hopeful promise that there can be an end to the unsatisfactoriness of life through freedom from craving. This freedom is called *nibbana* in Pali or *nirvana* in Sanskrit. Nirvana, often translated as “extinction,” is not complete annihilation. Nirvana is the extinction of craving; it is sometimes compared to the blowing out of a candle. Since craving causes the unsatisfactoriness of life, the extinction of craving brings peace and happiness. Nirvana is also the end of ignorance and thus is identified as unconditioned, absolute truth, which brings wisdom and compassion and ends the cycle of craving, grasping and

We are shaped by our thoughts; we become what we think. When the mind is pure, joy follows like a shadow that never leaves. • **Buddha (c. 563–c. 483 BCE)**

Sculptural representations of the Buddha, such as this one from the Gandharan region of northern Pakistan (first century CE), varied as his iconic image moved from India to Central and East Asia. Musée Guimet, Paris.

illusion. Nirvana cannot be defined or comprehended in concepts; it is a religious state that must be experienced to be fully understood. The Buddha described it in negative terms as not born, not produced, and not conditioned. Nirvana manifests itself in the Four Noble Dwelling Places: the virtues of loving kindness, compassion, appreciative joy, and equanimity. The Fourth Noble Truth is the Eightfold Path, which presents a way of life that leads to nirvana. It consists of three stages. The first stage, wisdom, comprises right

understanding and right thought. The second stage is morality or ethical conduct and comprises right speech, right action, and right livelihood. The final stage is meditation and comprises right effort, right mindfulness, and right concentration.

Gautama challenged the social mores of his time by forming monastic communities in which all were equal, regardless of the class or caste they came from. Gautama may have been the first person in history to establish a monastic community for women. He taught a meditation practice that focuses on the direct experience of each moment, acknowledging sensations, emotions, and thoughts without grasping at pleasant moments or pushing away unpleasant experiences.

Gautama lived in northern India and Nepal. After his death, the Indian emperor Asoka (d. 232 BCE) promoted Buddhism throughout much of the Indian subcontinent and sent Buddhist missionaries to other parts of Asia, including present-day Sri Lanka, Kashmir, the Himalayas, present-day Myanmar (Burma), and the Greek kingdoms of Bactria in Central Asia. Through these efforts Buddhism began its growth as an international religion.

Buddhism

More than two millennia ago in India, Siddhartha Gautama became “the Buddha” and began to teach that one can only escape suffering and sorrow by living along a righteous path that ends with the extinction of desire and ignorance. The Buddha’s teachings lie at the core of what has become one of the world’s largest religions.

Buddhism is the world’s fourth-largest religion after Christianity, Islam, and Hinduism. Buddhism is approximately twenty-five hundred years old and has influenced cultures, events, and thought for generations. It is devoted to the improvement and eventual enlightenment of people, primarily through their own efforts.

The Indian philosopher Siddhartha Gautama founded Buddhism. The traditional dates of his life are 566 to 486 BCE, although recent studies suggest that Gautama was born as much as a century later. Gautama became known as “the Buddha” (the Enlightened One) after achieving enlightenment. He was born a prince of the Sakya clan in a small Indian kingdom in what is now Nepal. He had every luxury of the day and on the surface an apparently satisfying life. He married, had a son, and was destined to inherit his father’s kingdom. However, at the age of twenty-nine he became dissatisfied with his life of ease after being exposed to the true lot of humankind: suffering, old age, disease, and death. His father had protected him from these things because of a prophecy that Siddhartha would become either a great king or a great spiritual leader. His father’s hopes for a powerful successor were dashed when Siddhartha walked away from this life of ease and became an ascetic, a wandering holy man.

For six years he studied and learned from various gurus and holy men while depriving himself of all but the most meager nourishment. Siddhartha discovered that the extremes of self-deprivation were no better than the extremes of luxury and self-indulgence, so he sought the “Middle Way,” another name for Buddhism. Gautama found enlightenment while meditating under a *bodhi* tree. The Buddha achieved nirvana—the extinction of all desire and ignorance—and proceeded to teach others how to achieve the same state for the next forty-five years. Through discussions, parables, teaching, and living, the Buddha taught the “path of truth or righteousness” (Dhammapada). The scripture (*sutta*), “The Foundation of the Kingdom of Righteousness,” contains a succinct exposition of the major points that the Buddha taught.

Basic Beliefs

The Buddha preached “the Four Noble Truths” that define the existence of humankind: (1) Life is sorrow or suffering, (2) this suffering is caused by our selfish craving and desires, (3) we can remove sorrow by removing our desires, and (4) the removal of our desires is achieved by following the Noble Eightfold Path. The Noble Eightfold Path defines the “correct” behavior as right conduct, right effort, right speech, right views, right purpose or aspiration, right livelihood, right mindfulness, and right contemplation or meditation. The Buddha had few prohibitions but listed “five precepts” that good Buddhists should generally adhere to: not to kill, not to steal, not to lie, not to imbibe intoxicants, and not to be unchaste or unfaithful.

A Buddhist cemetery in Kyoto, Japan, in the late 1880s includes open pavilion shrines and sculptural figures.

The Buddha taught that *skandas* (experiential data) create our existence from moment to moment and that only karma (the law of cause and effect) operates through our experience and is never lost. However, everything is changeable and impermanent. The Buddha made few concrete statements about the afterlife or the nature of “god”—realizing that the Middle Way can be taught but that each person must experience dharma—the realization of nirvana. His final admonition to his followers was to “work out your salvation with diligence” (*Buddhist suttas* 2000, 114).

After the Buddha—Growth in India

The Buddha was a practical teacher who knew that people need instruction, and he established the *sangha* (community of Buddhist monks and nuns) to carry on his work and the work of their own salvation. The Buddha instructed the *sangha* that it could change or delete any of the lesser rules after his passing if the *sangha* saw fit. Ultimately,

the Buddha urged his followers to be “a lamp unto themselves.” Buddhism provides a system that demonstrates where we err and how to correct our errors not by miracles but rather by hard work and contemplation.

One of the most noted people who helped to expand Buddhism was the Mauryan ruler Asoka, who ruled from 272 to 231 BCE. The Maurya Empire (c. 324–200 BCE) grew from the state of Magadha after the time of the Buddha and rapidly expanded after Alexander of Macedon invaded India in the 320s bce, creating the first really unified kingdom in India. Asoka became a convert to Buddhism and helped to expand it by providing for missionaries and monks, so that Buddhism became a world religion while Hinduism remained confined to India. He is often compared with Roman emperor Constantine in the West, whose conversion to Christianity in 312 CE helped that religion to grow. Inscriptions on pillars and rocks throughout Asoka’s realm encouraged the citizens of the empire to follow the dharma, limit the killing and cruelty

The Great Mandala of Japanese Nichiren Buddhism. This hanging paper scroll includes inscriptions in Chinese characters and medieval Sanskrit, as well as images of protective Buddhist deities and elements that represent Buddha's enlightenment.

to animals, and live a righteous life. Like Christianity, Buddhism may also have provided Asoka and the Mauryans with a code of conduct and a way to help manage, enlarge, and consolidate the empire. Buddhism also benefited from the patronage of a king who helped it to reach beyond the borders of India.

Theravada, Mahayana, and Vajrayana Sects

The Maha-Parinibbana Sutta (Book of the Great Decease) concerns the final days and death of the Buddha and is important because the Buddha did not consider himself to be a deity. It illustrates the relationship between the Buddha and Ananda, a cousin of the Buddha who was a disciple and his personal servant. A warm, trusting relationship between the two shines through the text. The first Council of Buddhism met to organize and retain the teachings of the Buddha several months after his death. The Buddhist Suttas, probably recorded by the first or second century BCE, is the canon of the Buddhist faith.

However, by the second and first centuries BCE Buddhism had already begun to diverge into schools of thought that evolved into the major sects of Theravada, Mahayana, and Vajrayana. The Theravada claimed to adhere closely to the original teachings of the Buddha and evolved along more monastic lines to spread through Southeast Asia to Sri Lanka, Myanmar (Burma), Thailand, and Cambodia. Theravada is also known as “Hinayana,” which means “lesser vehicle.” Mahayana (greater vehicle) Buddhism became the more adaptive Buddhism. With an emphasis on compassion and flexibility, it meshed with the cultures it encountered to spread to China, Korea, Japan, and Vietnam. Mahayanists also developed the idea of the bodhisattva (a being who compassionately refrains from entering nirvana in order to save others and is worshipped as a deity). Vajrayana (diamond vehicle) Buddhism is also known as “tantric Buddhism” and spread to Central Asia, primarily Tibet.

The Silk Roads and the Spread of Buddhism in Asia

A network of trade routes called the Silk Roads made travel possible from China to the Mediterranean and to India from about the second century CE to approximately the fifteenth century, connecting the world in ways it had not been before. Religions in particular found their way to new lands and different cultures

Buddhist shrines originated as stupas (burial mounds for Buddha's ashes and relics). In China the dome form elongated to become a pagoda with layers of relief sculpture depicting the events of Buddha's life.

via the Silk Roads. Buddhism originated in India and spread to the Kushan areas, part of what is today Pakistan and Afghanistan, by the first century CE. Buddhism developed a number of sects, built many monasteries, and became a consumer of many of the luxuries of the day, especially silk. Buddhist monasteries often provided solace for weary travelers, and Buddhist monks, nuns, and their devotees acquired massive quantities of silk for ceremonial functions. A symbiotic relationship existed whereby the growth of Buddhist monasteries increased demand for silk while also supporting its trade and movement.

The earliest schools of Buddhism to spread along the Silk Roads were the Mahasanghikas, Dharmaguptakas, and Sarvastivadins, eventually to be subsumed by the Mahayana sect. As Buddhism spread to

Central Asia and China, pilgrims began to seek the origins of Buddhism, visiting its holy sites and bringing home its sacred texts. The travels of fifty-four Buddhists, starting as early as 260 CE, are documented in Chinese sources.

Xuanzang, also known as Hsuan-tsang, was a Chinese Buddhist monk; like many others he sought a more in-depth understanding of his faith by seeking out original documents and visiting places where the faith began in India. Xuanzang began his 16,000-kilometer journey in 629 CE and returned in 645. As Xuanzang began his journey, the Tang dynasty (618–907 CE) emperor, Taizong, was beginning to restore China and make it a powerful force in Central Asia.

Xuanzang encountered Buddhist stupas (usually dome-shaped structures serving as Buddhist shrines) at Balkh and two large Buddhist figures at Bamian in Afghanistan. Although many areas of former Buddhist expansion were in decline, Xuanzang found in Kashmir one hundred Buddhist monasteries and five thousand monks. Welcomed in India at Nalanda by thousands, Xuanzang found a place of intellectual ferment. Cave paintings at Dunhuang record the triumphant passage of Xuanzang back to China; Xuanzang finished *The Record of the Western Regions* in 646 to document his journey. Gaozong, Taizong's son and successor, built the Big Wild Goose Pagoda at Xuanzang's urging to house relics and Buddhist scriptures.

A chaotic period of religious exchange and development began with the rise of the Mongols during the 1100s and 1200s. The Silk Roads' pivotal role in cultural and religious exchange eventually declined with the advent of the Age of Exploration during the fifteenth and sixteenth centuries. Additionally, Muslim control of long-distance trade routes helped to enhance the Islamization of Central Asia. Central Asian peoples apparently therefore accommodated themselves to those people who were the major participants in their trade connections. Trade led to cultural exchange; thus trade was an important factor in spreading the world's great religions.

Chinese emperors worshipped at this great Buddhist temple when they retreated to Beijing's Summer Palace during the hottest months.

Buddhism in China and Japan

Buddhism, Christianity, and Islam spread in various areas, but to truly make a home in foreign lands these faiths often accommodated themselves to the local culture and modified or even changed some of their values or traditions. In China Buddhists spreading the faith emphasized the compassionate aspects of the faith rather than the disciplined

aspects of Theravada Buddhism, and Nestorian Christians used Daoist (relating to a religion developed from Daoist philosophy and folk and Buddhist religion) or Buddhist terms, calling the books of the Bible “sutras” (precepts summarizing Vedic teaching).

Buddhism reached China by the first century CE, and a number of Mahayana sects developed there, including Tiantai, Huayan, Pure Land, and Chan.

Pure Land developed as a way to reach the general population without its members having to grasp all the intricate philosophical teachings of Buddhism. Followers of Pure Land simply were to call or chant

the name of Amitabha Buddha for salvation in paradise or the Pure Land.

The Indian monk Bodhidharma is reputed to have brought Chan Buddhism to China during the sixth

Religion is to mysticism what popularization is to science.

• **Henri Bergson (1859–1941)**

century CE. The word *Chan* (*Zen* in Japanese) derives from the Sanskrit word *dhyana* and means “meditation,” so Chan is meditation Buddhism. Towering figures such as Huineng (638–713) and Zhaozhou (778–897) strengthened Chan so that by the ninth century major schools of Chan called “Linji” and “Caodong” had developed and would later be exported to Japan as the Zen sects of Rinzai and Soto.

Buddhism had already arrived in Japan from China and Korea during the 500s CE. During the Kamakura period of Japanese history, from 1185 to 1333, Buddhism experienced dramatic growth and reinvigoration. Energetic and charismatic figures such as Nichiren (1222–1282) founded new sects. The medieval period has been characterized as one of the most religious times in Japanese history.

Buddhism had evolved in China to the point that, during the Southern Song dynasty (1127–1279), Chan or Zen dominated Buddhist teachings. Scholars usually credit Myozen Eisai (1141–1215) for introducing Rinzai Zen and Dogen Kigen (1200–1253) for introducing Soto Zen. The Rinzai sect emphasizes *koan* (spiritual exercise) as its prime tool for achieving understanding and enlightenment, whereas the Soto sect emphasizes *zazen* (sitting meditation). Both Eisai and Dogen studied in China under Chan masters, receiving recognition of their enlightenment—an official document of lineage is important in Zen and helps to provide credentials to teach upon one’s return home. During the twentieth century, appreciation of Dogen’s work grew, and today Dogen is perceived as one of Japan’s greatest geniuses and the most noted Zen figure in Japan.

With the influx of Chinese masters during the 1200s and 1300s, Japanese Zen more closely resembled its Chinese Chan counterpart. In fact, the Five Mountains system of temple organization, which arose during the late 1300s, was based on the Chinese model. The ironic aspect of Zen growth is that Zen had few real practitioners. Its primary role initially was transmitting Chinese culture to Japan. The Japanese and Chinese masters achieved influence and success because of their access to Chinese culture during the Song dynasty (960–1279).

Buddhism and the West

Much of the early Western exposure to Buddhism came through the Japanese. Eight people, including three Buddhist priests, represented Japanese Buddhism at the World Parliament of Religions in 1893, held in Chicago. The writings of D. T. Suzuki helped to open Western eyes to Buddhism and began to popularize Zen Buddhism. During the last half of the twentieth century, new patterns of immigration and many U.S. and European citizens who turned to non-Western faiths helped Islam, Buddhism, Hinduism, Confucianism, and Daoism have an impact on Western culture. Older and recent emigrants from Asia—Chinese, Koreans, Vietnamese, and Tibetans—have played a large role in establishing a Buddhist foothold in the West and exposing Westerners (Euro-Americans) to the traditions of Asia.

Buddhism’s rise in the United States can be attributed to people’s search for answers and the rapid changes brought about by a modern and consumer-driven society. Buddhism’s rise is also because of dedicated teachers, such as Sylvia Boorstein, Chogyam Trungpa, and Jon Kabat-Zinn, who have helped to popularize the faith. The Vietnamese monk Thich Nhat Hanh has had an important influence on U.S. Buddhism. The Dalai Lama (the spiritual head of Tibetan Buddhism) also has promoted a more engaged Buddhism with his pleas for Tibetan freedom from China. The Tibetan diaspora (scattering) has opened up access to teachers and lamas (monks) who, until the Chinese occupied Tibet in 1959, were little known outside their own country. The Dalai Lama himself has come to symbolize for many the face of Buddhism shown to the world. His character and compassion in the face of difficulties for his own people exemplify for many the best attributes of the Buddhist life.

Shunryu Suzuki was a Japanese Zen priest who came to the United States in 1959 and settled at a small temple in San Francisco. He is credited with establishing the first Zen monastery in the United States at Tassajara, California, in 1967. *The Three Pillars*

of Zen (1965) by Philip Kapleau was one of the first books in English that discussed the practice of Zen Buddhism. The book has had an impact far beyond the students of Kapleau because many people in the United States lacked access to a Buddhist teacher but were shown how to begin meditating and practice on their own by Kapleau's book. Much of the Buddhist faith in Asia is centered on the *sangha*, whereas in the United States no real *sangha* exists.

Buddhism and Change

Buddhism flowered in the West during the last three decades of the twentieth century, and Zen became a cottage industry. What attracted Westerners, particularly well-educated and professional people, to the faith? The beliefs of Buddhism "are more compatible with a secular scientific worldview than those of the more established Western religions" (Coleman 2001, 205).

In a world that grows smaller each day, the Internet has provided a link to the Buddhist communities of the world and has begun to house the vast amount of Buddhist scriptural writing. The Internet may hold hope for many who practice alone or who are in ill health to have access to qualified teachers. Nonetheless, Buddhism is uniquely suited to isolated practice and meditation. Whether Buddhism will continue to broaden its appeal in the West is difficult to say. Even in Asia monasteries and monkhood are difficult choices in an ever-broadening world consumer culture. Buddhism, like many of the great faiths of the world, has found ways to adapt and survive for centuries. Buddhism continues as a way, the Middle Way, to work toward peace, compassion, and enlightenment. Yet, we have only to look back to the Buddha's own words to find the future of Buddhism. The Buddha said that the only really permanent thing in this world is change.

Byzantine Empire

Historians debate whether the Eastern Roman Empire became the Byzantine Empire in the fourth or the sixth century CE, but the Christian civilization based at Constantinople (now Istanbul) became a major power of Europe and an important connection between the West and East. Even after its conquest by the Ottoman Turks, Byzantium's cultural influence endured.

The Byzantine Empire was a Christian, Greek-speaking, multiethnic continuation of the Eastern Roman Empire, and, as an entity that developed organically out of the Roman Empire and its ancient Mediterranean civilization, it has no clear starting point. Many date its origins to the year 330 CE, when Emperor Constantine I (the Great) established his new imperial capital, Constantinople (modern Istanbul), on the site of an ancient Greek city known as Byzantium (*Byzantium* in Latin). Others favor the mid-sixth century during the reign of Justinian I the Great (reigned 527–565 CE), the last emperor of Constantinople to speak Latin as his native tongue, who presided over Byzantium's First Golden Age and whose policies dominated much of Byzantium's subsequent history, for good and ill. Still others argue that the Byzantine Empire only emerged as a distinctive civilization and empire after the Arab conquests of the seventh century ended classical Greco-Roman civilization in the eastern Mediterranean and North Africa.

Whatever its point of origin, the Byzantine Empire ended on 29 May 1453, when Ottoman Turkish forces captured Constantinople, the last, small remnant of a once-vast empire. Even this event, however, did not snuff out Byzantine culture, which continued to inspire various Eastern Orthodox Christian peoples, most

notably Greeks, Russians, Ukrainians, Romanians (Rumanians), Bulgarians, and Serbs. In addition, Byzantine influences on Ottoman culture, especially that of the court of the sultan, were significant.

The term *Byzantine* is modern, coined by historians to underscore the distinctive qualities of the civilization centered in Constantinople that emerged sometime between the fourth and seventh centuries of the Common Era. The Byzantines always referred to themselves as *Romaioi*, Romans, and viewed their capital city as New Rome.

Constantinople

Located on the Bosphorus, a short, narrow strait that separates Anatolia from Thrace (the far southeastern corner of Europe) and connects the Sea of Marmara with the Black Sea, Constantinople was ideally situated. The city was the natural meeting place of East and West, which was a major factor in Constantinople's early growth in population and wealth. The city possibly housed as many as 500,000 people at its demographic high point in the early sixth century before a series of plagues beginning in 542 caused a downward spiral in population, from which it never fully recovered.

Its location and riches also made it one of the most besieged cities in the history of the world. Its massive triple land walls and superior harbor allowed it to resist the attacks of Goths, Huns, Persians, Avars, Slavs, Arabs, Magyars, Bulgars, Pechenegs, Vikings, Rus', Seljuk Turks, European crusaders, and a wide variety of other peoples. Only on two occasions, in 1204 and 1453, did Constantinople fall to the assault of a foreign army.

The domed plan of the sixth-century Hagia Sophia in Constantinople (modern Istanbul) provided symbolically soaring interior spaces for worship. Ottoman Turks added the minarets after 1453.

The Empire's Boundaries

Due to the vicissitudes of history, the boundaries of the empire were in constant flux. At their greatest extent under Justinian the Great in the mid-sixth century, Byzantine lands included Italy, Sicily, North Africa, and southeastern Spain, as well as Syria-Palestine, Egypt, the Balkans as far north as the Danube, and Anatolia (modern Asiatic Turkey) as far east as Armenia. The rise and expansion of Islam in the seventh century resulted in Byzantium's losing Syria-Palestine, Egypt, and North Africa. Earlier it had lost its foothold in Spain and most of Italy to Germanic forces, and in the ninth century

Byzantium lost Sicily to Arab invaders from North Africa. In 1071 its last Italian outpost, Bari, fell to Norman French invaders, but only after Byzantine civilization had left a permanent imprint on the culture of southern Italy. Because of Byzantium's long presence in southern Italy, knowledge of Greek and study of Greek texts never totally vanished in the West during the so-called Middle Ages.

Despite these territorial losses, the empire remained a major power in the Eastern Mediterranean down to around the year 1200 because it held on to much of its heartland—the Balkans, Greece and the Aegean Islands, and Anatolia—despite invasions by hostile neighbors, including the Bulgars and Normans in the

Balkans and Seljuk Turks in Anatolia. This territorial core made it an empire that continued to straddle portions of Europe and Asia. Byzantine merchant vessels and war ships were equally at home on the Mediterranean and the Black seas, and the trading emporiums of North Africa, western Europe, Inner Asia, and Southwest Asia, were all within easy reach.

After 1204, however, the empire's heartland began to shrink appreciably due to conquests by western Europeans and Ottoman Turks. By the year 1400 the empire was a shadow of its former self.

God-Anointed Emperors

As successors of Constantine the Great (reigned 306–337 CE), the first Christian Roman emperor, Byzantine emperors claimed the title “equal of the apostles” and saw themselves as responsible for the well-being of all Christians, not just those who inhabited lands controlled directly by the empire. Consequently, Byzantine foreign policy, both in respect to Christian and non-Christian powers alike, was aimed at securing acknowledgment of the emperor’s position as head of the Christian world and protector of all Christians, no matter where they might reside.

As defenders of the orthodox (i.e., correctly believed) faith and Roman legitimacy, Byzantium's emperors normally pursued defensive military and territorial policies. Much like China's emperors, territorial expansion was usually far less important to those who sat on the Byzantine throne than acknowledgment by their neighbors of the emperor's unique place in the world. Although the empire had a few notable military emperors, such as Basil II, who aggressively expanded Byzantium's borders, its leaders, also like their Chinese counterparts, mainly employed military action as a last resort, preferring the tactics of bribery, diplomatic marriages, and awe-inspiring court ceremony to neutralize potential and real enemies.

Byzantium and Its Neighbors

As an empire that sat astride a web of land routes and sea routes connecting much of the Afro-Eurasian

world, the Byzantine Empire employed in its service large numbers of foreigners, both Christian and non-Christian. Mercenaries from a wide variety of Turkic and western European cultures played key roles in Byzantium's armies.

Although generally conservative in exercising military power, Byzantium's emperors had a sense of mission when it came to spreading the faith peacefully among their pagan neighbors. Indeed, exporting missionaries to the Slavic peoples of the Balkans and Russia was an integral part of Byzantine foreign policy in the ninth and tenth centuries. At the same time these same emperors showed no particular desire to convert Zoroastrians in the Sasanian Empire of Persia or Muslims, who in the mid-seventh century replaced the Sasanians as Byzantium's greatest rival.

Holy war, either in defense of the faith or to spread it, was also a concept largely absent from the Byzantine mind. There were two notable exceptions to this Byzantine distaste for holy war. During the reign of Heraclius (reigned 610–641 CE), a life-or-death struggle with the Sasanian Empire, whose armies had sacked Jerusalem and carried off the relic of the True Cross, assumed the proportions of a holy war. Following the capture of Constantinople in 1204 by the army of the Fourth Crusade, a Byzantine Empire-in-exile at Nicaea in Anatolia fostered the notion of holy war to recapture the sacred city of Constantinople, until finally the city was retaken in 1261.

Byzantine Cultural Exports

Constantinople was a city of numerous churches, including the massive Hagia Sophia, the Church of the Holy Wisdom. Built between 532 and 537 CE, it and its slightly earlier prototype, the Church of Saints Sergius and Bacchus (the present-day Kûçũkayasofya Mosque), signaled the genesis of a new form of ecclesiastical architecture—the Byzantine domed church—that proliferated throughout the empire and beyond. During Byzantium’s First Golden Age of the sixth century, the five-domed Church of the

The monogram of Emperor Justinian I (r. 527–565) is part of an elaborate and ornate design on the column capitals inside the Church of Saints Bacchus and Sergius, Constantinople.

Holy Apostles was raised on Constantinople's highest hill. The burial place of emperors, it served as the model for the five-domed basilica of San Marco in Venice and numerous Slavic Orthodox churches in Eastern Europe.

In addition to architecture on a grand scale, Constantinople (as well as other major Byzantine cities, such as Thessaloniki) was also a center of ancient Hellenic and Christian studies. Secular Hellenic literature, philosophy, and science—including the study of the works of Homer, Plato, and Euclid—provided the core of an upper class Byzantine's education. But the Byzantines did not keep this learning to themselves.

Byzantium's preservation of many of the classic literary and philosophical texts of ancient Greece, especially the *Dialogues* of Plato, made possible their direct transmission to the West in the fourteenth and fifteenth centuries, where they were avidly studied by Italian humanist scholars. Earlier, during the ninth century, Caliph al-Mu'tasim established the House of Wisdom in Baghdad, where Byzantines and Muslims cooperated in translating into Arabic a vast body of

ancient Greek scientific knowledge, especially treatises on medicine and other "practical" sciences, such as mathematics, geography, and astronomy. These texts, which traveled from the schools of Byzantium to Baghdad, had a profound impact throughout the Islamic world. And it was largely from Muslim Spain, al-Andalus, that the works of Aristotle and Galen entered Christian western Europe during the twelfth century. These texts, preserved by Byzantium, translated into Arabic, and then translated into Latin, were key factors in an intellectual and educational revolution that some label "Europe's Twelfth-Century Renaissance."

During the ninth and tenth centuries, as Byzantine secular learning was permeating the intellectual world of Dar al-Islam, Byzantine Christian studies were transforming the cultures of many Slavic peoples.

During the 860s CE the brothers Constantine (also called Cyril) and Methodius worked as missionaries in Moravia and translated the gospels and a wide variety of other church literature from Greek into Slavic. Whereas the Western Church, with its center in Rome, imposed the Latin liturgy and Latin

ecclesiastical scholarship on all of its converts, the Byzantine Church allowed converts from other cultures to retain their own languages in the liturgy and to read religious texts in their own tongues. With that in mind, Constantine-Cyril created a Slavic alphabet, which he based on the Greek alphabet but modified to accommodate particular Slavic sounds. As reworked later by disciples of the two brothers, it became the Cyrillic alphabet.

Beyond creating an alphabet, Constantine-Cyril was also instrumental in crafting a Slavic sacred language—Old Church Slavonic—that he based on a southern Macedonian dialect. Because the brothers and their associates translated the Bible and a huge volume of other religious literature into Old Church Slavonic, it rapidly became an ecumenical language, which all Orthodox Slavic churchmen, regardless of their regional dialects, learned and used. Beyond that, it rapidly became a flexible literary tool. Original works, such as the life of Saint Constantine-Cyril and monastic chronicles, soon appeared alongside imported religious texts.

Laying Byzantium's Foundations (324–476 CE)

In 324 Constantine I, Roman emperor of the West and a champion of Christianity, defeated and killed his pagan imperial colleague, Licinius, Roman emperor of the East. Now, for the first time since 293, the Roman Empire was united under a single ruler. In honor of his victory, Constantine ordered that Byzantium be expanded and rededicated as Constantinople (Constantine's City). Dedicated on 11 May 330, the city served as Constantine's residence until his death in 337.

During these latter years of his life, Constantine established the principle that the Church enjoyed the legitimacy of imperial authority and its doctrines carried the force of imperial law. All of Constantine's successors were baptized Christians, even Julian (reigned 361–363), named “the Apostate,” who renounced the faith and unsuccessfully tried to restore the ancient pagan civic cults. By the reign of Theodosius I (reigned 378–395), the last Roman emperor to rule over both halves of the empire, the marriage between

The monogram of Empress Theodora, Justinian's wife, appears only (but clearly) on the exterior of the Church of Saints Bacchus and Sergius.

church and state was complete. In 391 Theodosius promulgated a series of edicts against paganism that transformed Christianity into the sole state religion.

Meanwhile, during the last quarter of the fourth century, Goths and other Germans were crossing the Roman Empire's frontiers in increasing numbers. Although they had no intention of destroying it, their cumulative impact led to the breakdown of the imperial system in the western half of the empire, which had had its own Roman emperors since 395. When the last Western Roman emperor, Romulus Augustulus, was deposed in 476, the theory was that the empire was again reunited under a single emperor, Zeno, who resided at Constantinople. In fact the West was fast becoming a mosaic of independent Germanic

kingdoms, and its culture was already beginning to undergo a process of radical transformation.

While the West was undergoing invasion and metamorphosis, the Eastern Roman Empire, which largely managed to deflect the Germans westward, was unable to help it in any substantive way due to its own instability and internal divisions, many of which were religious in nature.

Rebuilding and Defending Byzantium (518–641 CE)

At this juncture the vigorous Justinian the Great (reigned 527–565 CE) emerged, first as chief counselor to his uncle, Justin I, then as emperor in his own right.

Justinian's administrative reforms reinvigorated the empire, but costly wars, a Mediterranean-wide plague that killed off up to one-half of the empire's population, and new invasions by Germanic Lombards in Italy and Slavs and Turkic Avars in the Balkans unraveled many of his gains. Despite setbacks, Justinian presided over an era of artistic creativity and political retrenchment. During his reign a massive rebuilding program changed the face of Constantinople.

In 603 CE the Sasanian Persian Empire struck hard in the East and by 622–623 seemed on the verge of conquering the whole Eastern Roman Empire. A counterattack led by Emperor Heraclius, however, carried the fight to the enemy, and in 628 Heraclius forced a favorable peace treaty on the defeated and disorganized Persians. In a sense, however, both sides lost, exhausted as they were by the protracted and bitter war.

Eastern Roman weakness made it possible for pagan Slavs to penetrate ever more deeply and fully into the Balkans. Equally menacing were attacks from out of Arabia by a new force, the armies of Islam, which invaded Syria-Palestine in 633–634. Jerusalem fell in 638, and by 641, the year of Heraclius's death, most of Egypt had also been lost.

Byzantium under Siege (641–718 CE)

The seventh century arguably witnessed the birth of a full-fledged Byzantine civilization, but also it was a period in which Byzantium struggled to survive. By 651 the Arabs had overrun Sasanian Persia; it is a wonder that they failed to conquer all of the Eastern Roman Empire. In 673 Arab forces initiated a siege of Constantinople that the Byzantines only broke in 677, thanks to a new weapon known as "Greek fire," an incendiary mixture of naphtha and pitch that was projected onto enemy vessels and troops. In 717 the Arabs returned with an immense army and navy but were driven back the following year. Between these two sieges a new hostile force appeared in the Balkans. The Bulgars, a warlike pagan people out of Central Asia, moved into northern Thrace, from which they could not be dislodged. The Bulgarian kingdom

would continue to be a threat to Byzantium for centuries thereafter, even after the Bulgars were converted to Orthodox Christianity in the ninth century.

The Iconoclastic Controversy (726–843 CE)

Like many other Byzantine emperors, Leo III (reigned 717–741), who led Constantinople's successful defense against the Arabs, fashioned himself a theologian. In 726 or 730 he instituted a policy of *Iconoclasm*, or image breaking, which prohibited the production, display, and veneration of icons, namely sacred images of God or the saints. Although unpopular among the masses, it was official church teaching and practice until the empress-regent Irene reversed it in 787. Leo V reinstituted the ban on icons in 815, but Empress-Regent Theodora suppressed Iconoclasm for good in 843.

Although eventually rejected as doctrine, Iconoclasm underscored the widening gap between Byzantium and the Church of Rome, most of whose popes were avid defenders of icon veneration. Moreover, in the middle of the eighth century, amidst the "Iconoclastic Controversy," the papacy turned to a family of Frankish warriors in its search for new defenders. From this family, the Carolingians, came Charlemagne (Charles the Great), whom Pope Leo III crowned Roman emperor on Christmas Day, 800. With its rival Roman emperor, the Latin West was rapidly moving away from its Greek coreligionists in the East.

The Macedonian Dynasty (867–1025 CE)

With the accession of Basil I (reigned 867–886), Byzantium acquired one of its longest surviving and most successful dynasties, a family of Armenian descent known as the Macedonians, under whom the empire enjoyed a Second Golden Age of territorial expansion, prosperity, and artistic innovation.

Under Basil II (reigned 976–1025), known as "the Bulgar-Slayer" because of his conquest of Bulgaria, the empire reached its apogee of prestige and power.

A late-Roman mosaic from the Bucoleon Palace, Constantinople.

The Black Sea was a virtual Byzantine lake, and no other empire in western Eurasia—the Abbasids of Baghdad, the Fatimids of Egypt, or the Ottonians of Germany—could rival it.

Seljuks and Crusaders (1071–1204)

On 26 August 1071, a new power in Islam, the Seljuk Turks, destroyed a Byzantine army at Manzikert in eastern Anatolia and captured Emperor Romanus IV. Although Sultan Alp Arslan released Romanus under generous terms, the defeat at Manzikert signaled a crisis. In early 1095 the threat of losing Anatolia to the Seljuks induced Emperor Alexius I (reigned 1081–1118) to request that Pope Urban II induce Western warriors to enlist in Byzantium's armies. The pope responded by transforming this request for mercenaries into a holy war fought by armies independent of Byzantine control and aimed at simultaneously aiding Eastern Christians and liberating Jerusalem. The result was the First Crusade (1096–1102).

Armies of the First Crusade managed to capture Jerusalem in 1099 and established four crusader states in the lands of Syria-Palestine. However, the transit of crusader armies across Byzantine territory, with the conflicts that resulted, as well as the establishment of the crusader states, fomented distrust among Byzantines, especially their emperors,

regarding Western motives. Throughout the twelfth century, but especially during the Second (1147–1149) and Third (1188–1192) Crusades, Byzantium's emperors pursued a policy of working to weaken crusader forces that crossed their lands, lest they threaten the integrity of Constantinople. This policy of self-preservation was perceived in the West as evidence of Byzantine perfidy and pro-Muslim sentiments.

Growing distrust of Byzantines, however, did not precipitate the capture of Constantinople on 13 April 1204 by the army of the Fourth Crusade. The factors that led to that capture were complex and largely unforeseen. Mutual animosity engendered by over a century of crusading, however, contributed to the armed clashes that ended in the crusaders' assault on and sack of the city.

The Latin Empire of Constantinople (1204–1261)

The crusader conquerors of Constantinople established a fragile empire that lasted from 1204 to 1261 and encompassed the capital city and much of Greece and the Aegean Islands. Meanwhile, several Byzantine empires-in-exile claimed the mantle of imperial legitimacy, with the most important being located at Nicaea in Anatolia.

Christ, Ruler of the World, a mosaic in the church of Hagia Sophia, was created about a century after the Eastern Byzantine and Western Roman Catholic churches split in 1085.

In July 1261 Byzantine forces from Nicaea reoccupied Constantinople, which had been left undefended, and a month later Emperor Michael VIII entered the city in triumph. The victory was less meaningful than it appeared. Portions of Greece and the Aegean Islands remained in Western hands. Worse, the events of 1204 had destroyed the myth of Constantinople's invincibility and shattered a civilization.

Borrowed Time (1261–1453)

A severely weakened Byzantine Empire barely managed to escape the machinations of Charles of Anjou, king of Sicily, prince of Achaea (southern Greece), and nominal king of Jerusalem. Charles had his eyes on Constantinople as the capital of a grand Mediterranean Empire. Circumstances, including his death in 1285, combined to defeat him and save Byzantium.

The Byzantines, however, could not avoid the relentless pressure of a new Turkish foe: the Ottomans. Around 1300 the Ottomans began to expand out from

northwestern Anatolia. By 1400 they had conquered all of Anatolia and most of the Balkans, effectively isolating Constantinople. Byzantium, however, received a half-century-long reprieve when the Muslim army of Timur i Leng (Tamerlane) crushed Ottoman forces at Ankara in 1402, forcing the Ottomans to abandon their blockade of Constantinople. It took the Ottomans two decades to recover from the disaster.

In 1451 the nineteen-year-old Mehmed II succeeded to the sultanate with plans to take Constantinople. After choking off the city from access to the Black Sea, his forces initiated their attack on 6 April 1453 and breached the city's walls on 29 May. Eleven centuries after Constantine the Great, the last emperor of Byzantium, Constantine XI, died in the fighting, and his body was never identified.

An empire had fallen, but the culture of Byzantium lived on.

Caesar, Augustus

(63 BCE–14 CE)

FIRST ROMAN EMPEROR

Gaius Octavius, the grandnephew and heir of Julius Caesar, assumed a position of power in Rome after Julius's death in 44 BCE. In 27 BCE he became ruler of the Roman Empire and was given the title "Augustus." He led the empire to its height, expanding its boundaries and introducing an era of peace and prosperity that lasted nearly two hundred years.

Augustus Caesar was born as Gaius Octavius in 63 BCE. His father had been governor of Macedonia; his mother was Julius Caesar's (100–44 BCE) niece. The young Gaius became Caesar's protégé, adopted son and heir, and his eventual successor. The newly named Augustus Caesar was deemed a ruthless leader but never a tyrant. He instituted reforms that brought prosperity and peace to the Roman Empire. He supported a building program in Rome that turned a city of brick, as he proudly declared, into a city of marble. He reigned for forty-four years and is considered one of history's most successful rulers.

Julius Caesar had been training Octavius, an astute and calculating soldier even in his teens, to be one of his major commanders; when Caesar was murdered in Rome on 15 March 44 BCE, the eighteen-year-old Octavius, who was commanding troops in Dalmatia, immediately returned to Rome. There he reluctantly joined forces with Mark Antony, Caesar's trusted friend, considered by many to be Caesar's obvious heir. But Octavius garnered influence with his position as Caesar's adopted son, and in 43 BCE he joined with Antony and (Marcus) Aemilius Lepidus (d. 12 or 13 BCE) in the Second Triumvirate. They declared Julius Caesar a god, eliminated several

thousand enemies in various battles and coups, and in 42 BCE defeated the primary murderers of Caesar—Marcus Junius Brutus (85–42 BCE) and Gaius Cassius Longinus (d. 42 BCE)—at Philippi in Macedonia.

By 36 BCE the Triumvirate was falling apart. Lepidus withdrew, and Octavius used Antony's alliance with Queen Cleopatra of Egypt as an excuse to turn on him, defeating him at the naval battle of Actium off the west coast of Greece in 31 BCE. Antony and Cleopatra fled to Alexandria and committed suicide the following year.

Now in complete charge of Rome, Octavius began to consolidate his power, carefully remaining within the structural limitations of the republic. He assumed power over Roman provinces, took the position of consul, and was given the title "Augustus," a religious term that implied powers beyond those of mere mortals. Later he was declared "pater patriae," or father of his country. Although he accepted the title "Imperator," this signified only control over the army and was not the title of emperor often mistakenly associated with him.

Augustus, as he is generally known, moved to consolidate many of Julius Caesar's reforms. He settled thousands of veterans in the provinces, paying the owners of the land with treasure looted from Egypt. To forestall any moves by ambitious generals, he assumed and maintained a position as commander of all military forces. Although the Senate and other republican components of Roman government remained intact, Augustus was emperor in all but name.

After the upheavals of several civil wars, the Romans wanted peace, and Augustus gave it to them. He granted significant autonomy to

A drawing of Augustus Caesar from 1797. The title “Augustus” implies power beyond that of a mere mortal.

provincial governors, reformed the Roman economy and tax structure, and began a period of peace and prosperity known as the Pax Romana. He became extremely popular throughout the empire and many statues were erected in his honor. Though Augustus was skeptical of too much expansion of the empire, he did spread Roman influence into central Europe and added more territory to the empire than any other Roman leader.

One of the most significant battles in history occurred during his reign. In 9 CE, the Roman governor Quintilius Varus was ambushed in the Teutoburg Forest in Germany and lost three legions. Unable to respond adequately, Rome lost any chance of gaining a hold in that region. According to the Roman

historian Suetonius (69/75–c. 130 CE) Augustus “took the disaster so deeply to heart that he left his hair and beard untrimmed for months; he would often beat his head on a door, shouting: ‘Quintilius Varus, give me back my legions!’ [Quintili Vare, legiones redde!], and he always kept the anniversary as a day of deep mourning.”

The failure to expand Roman civilization into Germany, as it had been expanded into Gaul, has had profound implications to this day. Roman culture, law, government, and language dominated the development of the western part of Europe, while the Germanic portion of Europe developed along quite different lines, more heavily influenced by the “barbarians” of the East.

The Pax Romana ushered in a golden age for Rome that would last for two hundred years. This was the age of Rome’s greatest poet, Virgil (70–19 BCE), whose most famous work, the *Aeneid*, is both the story of the aftermath of the Trojan War and a treatise on the Roman Republic. Other important writers included Horace, Ovid, Pollio, and Livy. The period also saw many architectural triumphs, some of which survive to this day. Augustus’s team of architects, most of them probably Greek, built a new Forum, with a temple dedicated to Mars the Avenger in commemoration of his victory at Philiippi; at Augustus’s own expense they restored the Temple of Jupiter on Rome’s Capitoline; and on the Palatine they erected a new temple to Apollo and transformed the Luperine cave—where Rome’s mythical founders, the twins Romulus and Remus, were suckled by the she-wolf—into an elaborate grotto. The accomplishments of Augustus and of Rome during this period are almost without parallel.

Rule by one man has its drawbacks; the poet Ovid (43 BCE–17/18 CE) was exiled because his writing fell out of “imperial” favor, and the upper classes often felt that they were ignored. Nevertheless, Augustus ruled for forty-four years and died peacefully in 14 CE. In his will he counseled Rome against further expansion for fear that the empire would become unmanageable, a prophetic concern that would soon

be borne out. Augustus was unable to name a direct descendant as his successor and finally settled on his stepson, Tiberius.

Although in his later years he became more dictatorial, Augustus was arguably the greatest of the Roman leaders. He presided over the expansion and consolidation of Roman civilization. He preserved and extended the reforms begun by Julius Caesar, expanded Rome's borders to defensible positions in central Europe, placed the army under his direct control, eliminating the possibility of popular generals seizing power, and began a period of peace and prosperity never again repeated in Roman history.

Caesar, Julius

(100–44 BCE)

ROMAN GENERAL AND RULER

Julius Caesar's success as a political and military leader earned for him the titles of **pontifex maximus** (high priest of the Roman Senate), **consul**, and **dictator**—roles so powerful that conspirators assassinated him in 44 BCE. The reforms that Caesar began, however, and that his grandnephew Augustus continued, forged an era of Roman prosperity.

Julius Caesar's extraordinary talents and ambitions allowed him to expand Roman control, promote domestic reforms, and become the leader of Rome. With his assassination on 15 March 44 BCE, Rome began a new era as an empire, one that would last five hundred years.

Gaius Julius Caesar was born to a patrician family in 100 BCE. Civil war had broken out, and generals were gaining increasing power. While he undoubtedly received a classic Roman education from his father and, most likely, a tutor, very little is known of Caesar's childhood. As a young nobleman, Caesar received religious and military training, and served in a number of military posts. He then entered politics and became a distinguished prosecutor.

Caesar possessed great personal charm—he was tall, handsome, and prone to dressing with flamboyant elegance. Marcus Tullius Cicero, Rome's greatest orator, commended Caesar's oratorical and writing skills. Thus Caesar's prominence attracted the attention of others with positions of power in the republic. He had a particularly antagonistic relationship with Sulla, Rome's dictator. (As a commander of the Roman army in 82 BCE, Sulla had stormed the city and massacred his enemies—about ten thousand citizens and some forty senators. Appointing himself

dictator, Sulla personally controlled the government until he resigned in 79 BCE.) Caesar was related to Sulla's enemies, most notably Marius (married to Caesar's aunt, he was almost as ferocious a commander as Sulla) and Cinna (Marius's successor and Caesar's father-in-law). Sulla, who disliked Caesar and mistrusted his ambition, allowed Caesar to serve in the army in Anatolia, where he continued to develop his political and military skills. After Sulla's death in 78 BCE, Caesar returned to Rome and practiced law, prosecuting prominent corrupt Romans and seeking out powerful friends. In 69 BCE he was elected to a one-year term as **quaestor** (assistant to the governor) in Spain, where his main duty was the administration of justice. This position also gained Caesar admission to the Senate.

Caesar, extravagant in his quest for influence, was heavily in debt; he allied himself with Marcus Licinius Crassus, the richest man in Rome, and Gnaeus Pompeius Magnus (Pompey the Great), a popular general whose power and influence were on the rise. By 63 BCE, at age thirty-seven, Caesar's military successes, political activities—and bribes—led to his election as **pontifex maximus**, a powerful lifetime position as the high priest of the Senate. A year later he was appointed **urban praetor**, a prestigious administrative post. When his wife was rumored to be having an affair he divorced her, claiming that Caesar's wife must be above suspicion. In 61 BCE, Caesar was assigned to Spain as governor of the interior, where his numerous military victories earned him considerable wealth.

In 59 BCE, Caesar combined forces with Crassus and Pompey in the First Triumvirate, and he was elected to the top administrative post of **consul**. He

proceeded to institute popular reforms, such as land redistribution, over the opposition of Marcus Porcius Cato and the conservatives. Cato, perhaps Caesar's greatest opponent, and Cato's allies promoted the prerogatives of the Senate and the preservation of the republic.

The Senate gave Caesar control over Cisalpine Gaul (northern Italy), Illyricum (Albania), and Narbonese Gaul (southern France). From 58 to 49 BCE, Caesar conquered the rest of Gaul (France and Belgium), led two expeditionary invasions of Britain, and at Alesia (France) in 52 BCE defeated a combined Gallic army led by Vercingetorix. (Caesar's expansion of Roman civilization west into Gaul instead of north into Germany began the dichotomy between central and western Europe that exists to this day. This westward expansion, reinforced by Roman defeat by the Germanic tribes in the Teutoburg Forest in 9 BCE led to the development of Roman culture, law, and language in the west and a very different culture in the east.)

Fearing Caesar's ambitions, Cato and his allies in Rome sought to deprive him of his command. Caesar's efforts at compromise failed, and the Senate gave Pompey control of the local legions in 49 BCE. Caesar immediately left his headquarters at Ravenna and led his troops toward Rome. When they crossed the Rubicon River, the border of his territory—which it was considered traitorous to cross without military authorization—he famously proclaimed, “the die is cast,” and civil war began. Pompey had the support of most of the Senate and nobility, but this support was only lukewarm, while Caesar was popular with Rome's small middle class and, especially, with the common people, or plebs, and city and provincial leaders. Within six months he defeated Pompey's supporters in southern Gaul and Spain. Appointed dictator by the now acquiescent Senate, he undertook further economic reforms. In 48 BCE he crossed the Adriatic Sea to Greece and on 9 August defeated Pompey's forces at Pharsalus. Pompey fled to Egypt, and Caesar pursued him, landing in Alexandria. But the “boy pharaoh” Ptolemy XIII had already ordered Pompey killed,

Jean-Léon Gérôme, *Julius Caesar and Staff* (c. 1863). Oil on canvas.

hoping to gain Caesar's favor and hasten his return to Italy.

Caesar, however, decided to stay in Egypt to raise much-needed funds. While there he met Ptolemy's half-sister (and co-ruler), Cleopatra, who had been driven into exile by Ptolemy's regency council. Caesar and Cleopatra began an affair, and she bore him a son. The liaison brought the wrath of Egyptian troops who supported Ptolemy, and when Caesar's forces defeated them, Ptolemy was killed. Caesar then established Egypt as a client state with Cleopatra as its queen. Further campaigns in Asia and Africa proved victorious, and Caesar triumphantly returned to Rome in 46 BCE.

In Rome, Caesar declared amnesty for those who had opposed him. (Cato, who had opposed Caesar at every opportunity, committed suicide rather than be pardoned by his nemesis.) Caesar instituted reforms, such as grain and land distributions to the poor at public expense, took a census of Rome, and

Raffaele Giannetti, *The Last Senate of Julius Caesar*. Oil on canvas.

continued his program of building public works to provide both glory and jobs. He settled veterans and the unemployed in provincial cities, reducing Rome's excessive indigent population. He expanded Roman citizenship and reformed the tax system. The Senate voted him countless honors, but some feared Caesar wished to be king, his power as consul and dictator notwithstanding. As Caesar planned another eastern campaign, a group of conspirators—primarily Gaius Cassius Longinus (a hot-tempered soldier who had been denied a post), Publius Casca (an impoverished supporter of Cassius), Marcus Julius Brutus, a former devoted protégée who some believed was Caesar's illegitimate son) and Mark Antony (Antonius Marcus, who was once a loyal Roman Tribune)—plotted Caesar's assassination.

On 15 March 44 BCE, three days before his planned campaign, Caesar set out to attend a meeting in the Senate at the Curia Pompeia. As he approached the assembly hall a man pushed a warning note into his hand, which he did not read. According to Christopher Hibbert's account of the following events in *Rome: The Biography of a City*, which is based on the writing of Plutarch and Suetonius, conspirators hovered around Caesar as he walked toward his chair, pretending to ask advice or favors. When a

man named Tullius Cimber gave the signal (by lifting the back of Caesar's toga), Casca struck the first blow, which missed its mark and just scratched Caesar's neck. Caesar grabbed Casca's knife and managed with his other hand to stab Casca in the arm with the point of a metal pen. Mayhem ensued as the other conspirators bared their daggers and stabbed Caesar time and again. Horrified bystanders who had not been aware of the plot fled for safety, while Romans either bolted their doors or flocked to see where the assassination had taken place. At Caesar's funeral Antony made a moving funeral oration, believing he could force the Senate to accept an autarchy and establish power of his own. The speech was imagined and rendered unforgettable by William Shakespeare in the play that both glorified and immortalized its eponymous subject.

Caesar bridged the gap between the Roman Republic and the Roman Empire. As he had predicted, a civil war followed his death. Beginning in 27 BCE, his grandnephew Gaius Octavius, as Augustus Caesar, ruled Rome for forty-four years. Julius Caesar's legacy includes his unquestioned abilities as a military commander and his reforms, including protections for Jews, which set the stage for an empire that would last five hundred years. His written descriptions of the

campaign in Gaul, and later of civil war, are considered some of the finest examples of military prose ever written and were used to enhance his image in Rome. His move toward a government dominated by one man stemmed the growing power of the generals and may have saved Rome as a unified empire. Caesar's name has become synonymous with ruler: the terms *kaiser* and *czar* are derivatives of Caesar. Other great leaders, such as Napoleon Bonaparte, sought to emulate his greatness, and Roman symbols were the inspiration for the styles of the French and other empires.

Camels

Adaptations to arid environments have made the camel an important draft animal, pack animal, and military mount in the dry regions of northern Africa and Central Asia. As the camel could carry humans across areas where no other domestic animal could, it made possible cultural, economic, and ecological exchange between otherwise separated societies.

The camel has played an important role in the environmental history of Africa and Eurasia since its domestication. Superbly adapted to arid environments, the camel has allowed human beings to negotiate the deserts and mountains of northern Africa and Central Asia, and in this sense the camel has been instrumental both in connecting the African societies and ecologies immediately to the south of the Sahara with the intercommunicating zone around the Mediterranean and in linking societies and ecologies across the southern axis of Eurasia itself, from the Mediterranean to China. Along with the horse, cow, donkey, and yak, it is one of the few domesticated animals that is large enough to carry an adult human.

There are two species of camels, the dromedary, or Arabian camel (*Camelus dromedarius*), which has a single hump, and the Bactrian camel (*Camelus bactrianus*), which has two. The domestication of the dromedary in Arabia sometime around 1200 BCE allowed it to replace the ass in desert transport, strengthened the hand of desert-edge communities around the Arabian peninsula, and launched the career of Bedouin culture. It likely strengthened the

states of the desert fringe and may possibly have played a role in the decline of the riverine civilizations of Egypt and Mesopotamia. In North Africa during the course of the fourth, fifth, and sixth centuries CE, the use of the dromedary as a draft animal largely replaced a system of haulage in horse- or ox-drawn carts. The economics of camel transport encouraged Muslim societies in both North Africa and the Middle East to reduce and finally abandon their commitment to carted vehicles and to roads.

The Bactrian camel, which has been less intensively researched than the dromedary, was domesticated in southwest Asia before 2500 BCE and spread to Iraq, India, Central Asia and into China. Like the dromedary, the Bactrian camel could be used as draft animal as well as a pack animal and a military mount. The Bactrian camel, however, was not as large or fast as the dromedary, and over time its range diminished. In Central Asia during the second half of the second century BCE, a hybrid camel produced from the interbreeding of the dromedary and the Bactrian took over the role once held by the Bactrian. The pure Bactrians were retained as stud animals.

The economic advantages of the camel over other beasts of burden in arid lands are several. It can consume vegetation that other mammals avoid, thanks to its rapid and frequent digestive cycle that efficiently breaks down dry matter and fiber, cellulose, and crude protein. The camel can go without water for longer than any other working animal and is able to survive extreme desiccation, up to the loss of forty percent of body weight in a lean animal. The amount of time that a camel can continue without water is a

Camelus dromedarius
(Arabian or Dromedary
camel, with one hump) and
Camelus bactrianus
(Bactrian camel, with two
humps), 1872. Illustration by
C. Votteler.

function of many variables, including temperature, age of the camel, and weight of the freight burden, among others. On occasion, fully loaded camels have been able to push through desert terrain for more than ten days without water.

Today, camels are principally found in a broad band that stretches east through the North Africa, the Sahara, and the African grasslands just below the Sahara through Turkey and the Middle East to the western half of India. Within this zone, camels are considered to be extremely important to the nomadic livestock economies of Somalia, Mauritania, and the Western Sahara and to be of major importance in Tunisia, Jordan, Saudi Arabia, Yemen, Sudan, Niger, and Chad. Camels have adapted themselves to a variety of different environments, and specialists today distinguish between the physical

characteristics of lowland, mountain, riverine, and desert camels.

Capitalism

Capitalism is the exchange—for private gain and at market-set prices—of labor, land, and goods. Capitalism is seen in all periods of history, in both the East and West, but was limited by large subsistence and religious/state sectors for most of history, and by communist regimes, with state control of the economy, in the past century. Capitalism has brought great material progress, but also periodic crises and inequality.

Capitalism is a system of economic activity in which goods and services—including labor—are bought and sold at prices determined by markets (that is, at prices resulting from interactions among large numbers of buyers and sellers). This is usually contrasted with subsistence production, where most production is consumed by producers and their families or immediate neighbors, and thus has no price; or socialist production, in which the government sets the prices of goods and services, and producers do not control the sale of their products.

Other noncapitalist systems exist as well. Throughout history many societies had command economies, where states or elites directed producers (often slaves) to provide them with goods and services. Another distinct system is guild production, where groups of craftsmen making the same products limit production and fix the characteristics and prices for all goods produced by guild members, rather than allow individual producers to compete.

Capitalism in World History

Much confusion has arisen regarding the onset of capitalism in history, because capitalism has always

been present alongside other kinds of economic activity. For example, in ancient Greece and Rome, while most rural production was for subsistence and the majority of production for the elites was command production by slave labor, there were also extensive markets in which land, slaves, luxury goods, wine, and grain were sold for market prices. In medieval Europe, guild production by skilled craftsmen existed alongside markets for unskilled labor and for most agricultural products. Even as far back as the Assyrian Empire in 2000 BCE, which was mainly a command economy, we have cuneiform records from merchants on the borders of the empire detailing their negotiations to obtain the best prices and profits in their long-distance trade.

Nor was capitalism simply a characteristic of Western societies. Imperial China had extensive markets for land, labor, and most agricultural and manufactured products from at least the early years of the Ming dynasty in the fifteenth century, and seems to have had considerable market exchange by overseas merchants since at least the Southern Song dynasty in the twelfth century. On a more limited scale, the Silk Roads (the network of roads and sea routes that linked Europe, Persia, India, central and Southeast Asia, and China) facilitated capitalist exchange among merchants and local trade centers all the way from the city of Xi'an in China to the Roman Empire as early as the first century BCE.

In sum, we find people conducting capitalist activities in almost every society, at every period in history. Nonetheless, it is only from the eighteenth century onward that we find societies in which a

Money is better than poverty, if only for financial reasons. • Woody Allen (b. 1935)

majority of the population depends almost entirely on the market to meet their basic needs.

Some historians identify earlier periods, in the sixteenth and seventeenth centuries, as a time of “mercantile capitalism,” believing that it was mainly merchants who depended on capitalist activities for their livelihood at this time. It is certainly true that in these centuries merchants in Europe, China, and the Middle East became richer and more numerous through the expanding Atlantic and Europe/Asia trade of this era. In the sixteenth century for the first time capitalist trade became global, as trade between Mexico and the Philippines, Asia and Europe, and Europe and the Americas created world-spanning circuits of exchange. Everything from gold and silver to horses and furs, silk and cotton cloth, rice and wheat, ivory and indigo, coffee and tea became globally traded goods.

A host of other groups, however, were also heavily involved in market activities. The great landlords of Britain, Prussia, and Turkey all raised food from their estates to sell to cities along the North Sea and the Mediterranean. So too did the landlords of Italy and southern France, and the middling farmers of northern France, Britain, and Holland, as well as the wine growers of France, Germany, and Italy. In addition, vast numbers of workers and craftsmen in the countryside—agricultural day laborers, building laborers, millers, blacksmiths, masons, bakers, spinners and weavers of cotton and wool, shoemakers, tailors, silk and linen producers—depended on the market for their livelihood.

In China, the sixteenth and seventeenth centuries saw an explosion of family and village production of rice, cotton, cloth, silk, ceramics, horses, paper, soy products, and even fertilizers for market sale, as well as more refined luxury goods. Indian and Southeast Asian producers became major exporters of printed cotton cloth and spices, and of exotic woods, gems, and dyes as well. The spread of capitalist markets governed prices in trading centers around the world, as gold and silver mined in the Americas was sold to British and Dutch merchants, who in turn used it to buy cotton, tea, silk, and ceramics from India and China.

Modern Capitalism

The shift from agricultural societies (in which energy came from wood, wind, water, and animal power, vehicles were built mainly from wood, and large buildings were made from stone), to industrial societies (in which energy came mainly from oil, gas, and coal and vehicles and large buildings were built mainly from iron and steel), was a momentous change in human history. Several social theorists have identified this shift with the emergence of a new form of capitalist activity, called “industrial” or “modern” capitalism.

Karl Marx, a German economist, wrote in his great work *Das Kapital* (published in 1848) that modern capitalism was founded on production that employed wage labor. Marx observed that in ancient Greece and Rome most economic activity was carried out by slave labor, and that from the Middle Ages up through the eighteenth century, most urban and rural production was carried out by independent or guild craftsmen in their own workshops, and by peasant farmers on their own or rented land. Wage labor may have been a substantial part of the economy, but only a minority of workers labored exclusively for others for a cash wage. With the onset of mechanized factories, and even more with the expansion of cities relative to the countryside, more and more workers depended entirely on the wages they could earn by working for others.

Marx argued that in modern, wage-based capitalism, when workers were dependent on being hired to survive, labor became simply another commodity that could be bought at a market price. Marx believed this made it possible for factory and farm owners to be ruthlessly efficient in their allocation of labor. Workers would suffer, but the system itself would benefit from this efficiency to make factory and farm owners increasingly rich. Indeed, Marx forecast a situation in which the number of landless workers for hire—the “proletariat”—would increase and their condition worsen, while the factory owners, farm owners, bankers, and other owners of valuable property or “capital” would grow richer but fewer as

competition weeded out the weakest among them. Eventually, the capitalists would be unable to hold off a revolt of the proletariat, who would establish a communist society in which labor could no longer be exploited because the government would own all property and employ all of the people.

Another German social theorist, Max Weber, who wrote in the early twentieth century, also believed that modern capitalism was distinctive, but focused on the owners of capital rather than the workers. Weber suggested that prior to the eighteenth century, merchants, landowners, and producers of luxury goods acquired money through capitalist market activity, but mainly with the goal of spending their wealth on luxurious lifestyles or to support a large retinue. These were the ways that people displayed their success and gained admiration. But with the emergence of societies in which large numbers of people were committed to a “Protestant Ethic” of a sober, frugal, disciplined, and hard-working life, the mark of success became not conspicuous consumption or support of numerous retainers but the creation of larger and larger enterprises through the reinvestment of profits in expanded businesses. “Modern capitalism” was thus distinctive in its goals and its outcome: the creation of ever-larger business enterprises and nation- or world-spanning companies with ever-larger numbers of employees.

In China and Japan too, from the eighteenth and nineteenth centuries onward, social critics commented upon the increased obsession with acquiring material goods and piling up wealth, to the exclusion of interest in art, painstaking craftsmanship, philosophy, and social harmony. Around the world “capitalism” became a byword for selfish striving, the impoverishment of agricultural and factory workers who depended on others for employment, the growing role of large industrial, mining, farming, and ranching enterprises, and the acquisition of boundless wealth by a new class of businessmen, bankers, and property owners.

Yet the progress of capitalism was not steady and smooth. As more and more workers and property owners became wholly dependent on capitalist

market activity, they became more prone to the cycles of booms and busts that occur in all capitalist markets. As noted in the introductory paragraph, the hallmark of capitalism is the buying and selling of commodities at prices set by the negotiations of buyers and sellers. Yet there is no certainty that these negotiations will always result in prices that exactly balance supply and demand. During periods of economic expansion buyers and sellers often become overly optimistic, and buyers offer higher and higher prices for goods, even borrowing to buy and invest. Eventually, buyers become overextended, demand falls off, the prices of goods start to stagnate or decline, and markets contract, going into recession. These business cycles seem to be an inevitable part of capitalism, and have been seen from the onset of global capitalism in the sixteenth century. Some of these cycles have produced economic downswings so severe—especially the global Great Depression of the 1930s—that it seemed that Marx’s prediction for the demise of capitalism was at hand.

By the second half of the twentieth century, however, it was clear that capitalism had more flexibility and resilience than either Marx or Weber had realized. In Europe and North America, then in Japan and Asia’s Pacific Rim, then in China, India, and Latin America, small new companies were continually created that grew to become major global enterprises, while older industrial giants that had once been emblems of capitalism—such as General Motors, AT&T, British Leyland, McDonnell-Douglas, Digital Equipment Corp, Polaroid—either radically downsized or disappeared. In addition, factory workers gained wages sufficient to support their own considerable consumption, while numerous skilled workers and entrepreneurs, including doctors and lawyers, realtors and athletes, writers and screen stars, became quite wealthy.

Capitalism and Modern Economic Growth

While the growth of large-scale enterprises and the expansion of wage labor to include a majority

People have conducted capitalist activities, across land and sea, in almost every society and at every period of history. Here, a carpet dealer hangs rugs large and small outside his shop in Istanbul, Turkey.

of workers—the hallmarks of modern capitalism—clearly occurred in association with a dramatic rise in living standards, the connection between capitalist systems and modern economic growth remains controversial. Did the extension of capitalist market relations throughout society and across the world—including imperial expansion whereby European governments took control of many African, Asian, and Latin American societies in order to secure natural resources and consumers for European producers—provide the impetus for the development of machines, factories, and modern industrial growth? Or did the invention of steam-powered machines, the development of factories, and growing wealth lead to the global spread of capitalist relationships?

The answer, as with many complex historical puzzles, is that both are partly true. There have been many occasions in history when the extension of capitalist relationships, driven by a growing population and increased international trade, have stimulated new production techniques and created greater wealth. From the Assyrian Empire, which became one of the first empires to greatly expand regional trade, to Song China, to Venice in the fifteenth century, Spain in the sixteenth century, Holland in the seventeenth, and Britain in the eighteenth, there have been many “efflorescences” in which countries entered a golden age of prosperity, cosmopolitan sophistication, and accomplishment. These usually arose because expanding trade

brought new ideas and opportunities that led to the acquisition of new lands or the discovery of new processes or techniques for more productive agriculture or manufacturing.

Thus Song China produced unprecedented amounts of iron from new ceramic-lined reverberant furnaces; Venice produced glass goods and arsenals of ships and weapons; and Spain produced Europe's finest steel armor and swords while Spanish and Portuguese pioneers in oceanic navigation opened routes to the Americas. Holland's extensive trade led to innovations in warehousing, finance, ship design, and the use of windmills, and Britain's Atlantic trade helped spur improvements in iron-making, cotton spinning, and agriculture that made it the richest country in the world.

Each of these economic flowerings except Britain's, however, was temporary. For a century or two, these societies enjoyed expanded markets, growing wealth, and vigorous innovation. Yet these bursts of prosperity waned, as competitors learned similar techniques, rising population diluted the earlier gains, and international trade patterns shifted, costing the leaders their advantages. Such market-led efflorescence produced new ideas and much new wealth, but they did not produce an institutionalized method of creating ever-more-productive innovations. Capitalism, by itself, thus could not fully launch modern, ever-accelerating economic growth. At the same time there is no doubt that the spread of modern industry and factory production had the effect of increasing capitalist relationships across society and the world.

Although from ancient Assyria, Greece, and Rome to imperial China and Golden Age Holland many individuals and groups engaged in capitalist activities, it remained true that in all these societies most peasants and farmers—who still constituted three-quarters or more of all pre-industrial societies—produced much of their own food. Even cotton spinners and weavers, silk cocoon growers, cotton farmers, and others who mainly produced goods for market also had some land on which they grew food for their families. The creation of societies in which a vast majority of the population depended entirely

on market buying and selling of goods and labor to meet their daily needs for food, clothing, and shelter is strictly a modern phenomenon, starting in the eighteenth century.

The creation of such capitalist societies depended on innovations in agricultural production that allowed farmers to produce far more food for workers, and on innovations in production that allowed vast numbers of workers to produce inexpensive goods that could be widely sold. These innovations arrived together in eighteenth-century Britain as the result of the harnessing of empirical science to agricultural and industrial techniques. While the hallmark of this shift was the invention and improvement of the steam engine, and its application to mining, agriculture, construction, and transport, the steam engine was just part of a cluster of British and American innovations that included new uses of roller and rotary technology to produce cotton yarn; to make mechanical saws and lathes to cut wood; to create cheap wrought iron and steel; and even to print books and newspapers. There were also changes in land use and cropping patterns, improvements in transportation that allowed fertilizers to travel to farmers' fields from hundreds or thousands of miles away, and for farmers in turn to send food to markets at similar distances.

Innovations in steam power and iron technology also enabled Britain and other European nations to build gunboats and railroads that they used to open up and subdue countries in Asia, Africa, and the Middle East and force them to engage in trade with Europeans. New production and transport techniques created global markets for a wide range of goods, and turned peasants and craftsmen into farm laborers and factory and retail workers around the world, a process that began in the eighteenth century but is still continuing today.

The Future of Capitalism

A future of universal capitalism is exciting to some, but horrifying to others. Capitalism can be a brutally competitive system, creating depressing inequality and panic-inducing boom-and-bust cycles. Indeed,

Opening to the world economy in 1978–1979 after nearly thirty years of anti-capitalist leadership, the Chinese marketplace has changed to reflect the growing consumerism of an urban population, especially evident during the Christmas holiday shopping season. Philip Baguet Collection.

in order to reduce the worst consequences of capitalist relations, governments have had to intervene with regulatory and judicial systems that enforce contracts, protect laborers, regulate competition, control the supply of money and credit, redistribute income, offer medical care and pensions, subsidize transportation, limit pollution, and provide sanitation and planning for cities.

Much of modern political debate and contention is over the degree to which government should step in with such activities to respond to the adverse consequences of capitalism, or let markets self-correct and self-regulate. Karl Marx and his followers—including Vladimir Ilyich Lenin in Russia, Mao Zedong in China, and Fidel Castro in Cuba—believed that the logical consequence of the need for government to limit the excesses of capitalism was to abolish those market relations altogether, and have the government own all property, provide all jobs, set all prices, and regulate all economic activity. Only in that way, under a communist system, could prosperity for all workers be achieved.

Yet Austrian, British, and American economists, including Friedrich Hayek, Joseph Schumpeter, Alfred Marshall, John Maynard Keynes, and Milton Friedman, argued that free markets were the best institutions for promoting economic growth, and

that sensible government policy should seek to help spread the benefits of market growth while maintaining effective market institutions. Schumpeter even lauded the “creative destruction” of business cycles that paved the way for more productive new producers to replace inefficient or obsolete businesses. Protecting the makers of buggy whips when automobiles were replacing horse carriages was no way to promote economic progress.

The evidence of global history, so far, tends to support the capitalist group. Although capitalist societies have had greater inequality and periodic recessions and depressions, the workers in such societies have still enjoyed far greater economic growth and prosperity than their counterparts in communist societies. Indeed, virtually all of the major societies that adopted communism in the twentieth century have abandoned it as an economic system and restored capitalist market relations.

Still, many argue that global capitalism remains a source of extreme inequality and disadvantage to the developing countries of Latin America, Africa, the Middle East, and South Asia, most of whom also had their economies and politics distorted by long periods of European colonial rule. These regions suffered severely during the economic crises of the 1990s and early 2000s. In the “Great Global

Recession” that began in 2007 (and from which many countries have yet to recover fully in early 2010) developing countries that had recently shifted toward more capitalist practices—including Russia, Brazil, China, and India—recovered most rapidly, suggesting that capitalism was now working well in these countries, while excessive financial speculation or deregulation undermined economic stability in the more developed regions of North American and western Europe.

Critics of capitalism worry that government action cannot forever serve as a palliative for capitalism’s competitive and cyclical tendencies, and look forward to a future utopia in which economic output will be so fruitful and so widely shared that market-set prices and market-set incomes will no longer dominate who obtains what goods and services. If that day comes, people will look back at capitalism as a system that was only helpful in promoting growth during an unpleasant period of scarcity and international competition for scarce goods.

Caravan

The formation of armed caravans made possible commerce across vast stretches of inhospitable or unoccupied land, by offering safety to their members and dividing the costs of travel. Nonetheless, trade by caravan was expensive, and the proliferation of sea, rail, and truck transport replaced the caravan by the twentieth century.

Throughout much of human history merchants who moved goods overland across long distances minimized their risks of loss to plunderers by traveling in caravans and carrying arms for protection. The merchants shared provisions and endured hardships, and their numbers provided them, at times, some degree of immunity from predation. Caravanners who passed from the domain of one political authority to another depended upon local authorities to secure their protection, and in return they paid transit fees, which might be offered in the idiom of tribute or gift giving. In traversing stateless areas, armed caravans could be as imposing as a small army. This practice of armed group travel, rooted in the elementary logic of safety in numbers, is ancient. References in early Chinese literature and in the Old Testament indicate the existence of the caravan during the first millennium BCE, and it may be even older.

The cost of transporting goods by land was generally higher than by sea or river, and thus caravans were mounted only in regions where these alternatives did not exist. In Africa north of the tropical forest and across Eurasia, merchants loaded their wares onto the backs of draft animals or in carts to be pulled by draft animals because the transport of goods by draft animal was less expensive than by human carriers. Across dry deserts such as the Gobi, the camel

was the only pack animal that could survive the rigors of the crossing. In the intense cold of the Himalayas, the yak was the pack animal par excellence. Along the southern coast of the Sahara, the ox and the donkey were preferred.

Caravans were highly vulnerable to the elements, and merchants first and foremost had to take into account the physical needs of their draft animals. These needs could mean nighttime and early morning travel to avoid searing daytime temperatures when crossing the arid desert or travel during only the temperate months in order to avoid snow and ice. This type of travel could necessitate days of rest in order for the animals to recuperate from strenuous marches between watering points and to consume nutritious pasturage. With many uncertainties en route, caravanners developed organizational strategies to minimize their risks. They recognized the need for centralized decision making. Typically, they chose a caravan leader to handle diplomacy, arbitrate disputes, and manage logistics and a guide to negotiate the terrain. Individual caravanners generally traded on their own accounts.

The best-known and most-researched traditions of caravanning are those of Afro-Eurasia. The longest and oldest overland trade route in the world was known as the Silk Roads, which stretched from China to the Byzantine Empire. It was in use during the early years of the first millennium CE. The merchants of the Silk Roads bought and sold along the length of the route, and their commerce was critically important to communities situated along it. Communities at various points along the Silk Roads—particularly in southwest Asia—maintained caravan rest houses, known as caravanserais, in order to encourage the commerce.

Members of an early-twentieth-century caravan in the Middle East take a rest.

The slow-moving, armed commercial markets were the principal arteries of cross-cultural communication between the distant Eurasian civilizations. Along the manifold routes and spurs of the Silk Roads traveled ideas, goods, inventions, and techniques.

The caravan routes that stretched across the Sahara, dating from the first millennium CE, likewise played an important role in world history, linking the societies of northern Africa with those along the southern coast of the Sahara. By the beginning of the second millennium CE, along these desert routes, negotiable only by camel, flowed the knowledge of Islam and literacy, as well as ivory, gold, and large numbers of slaves.

Slave Labor

Beyond the Saharan and Central Asian basins, merchants also moved goods over great distances. In tropical Africa no indigenous beasts of burden

existed, and the tsetse fly, the insect that carried sleeping sickness, killed off the domesticated draft animals of Eurasia that tried to penetrate the open woodlands and forests. Thus, caravans in tropical Africa were typically composed of long lines of human beings, rather than pack animals and carts, and slaves rather than free people were generally put to this labor. With human portage, transport costs (measured in food requirements for the laborers) were high, and consequently goods that had a low value-to-bulk ratio—such as grains or foodstuffs—generally were not transported even moderate distances.

Mesoamericans (people of the pre-Spanish culture area extending from Mexico to northern Central America) used a similar pattern of using slaves to carry goods. In the Andes, by contrast, goods of up to 45 kilograms in weight could be mounted upon the backs of llamas. During the sixteenth century the Old World draft animals established themselves

in the New World and came to bear the burden of long-distance overland transport where feasible.

Although the caravan has long been associated with long-distance trade, most caravanners likely took part in the regional exchange of goods and services. One pattern linked nomadic societies with sedentary societies around the Central Asian and Saharan basins. In the Sahara, for example, a larger percentage of caravanners transported Saharan salt into West African villages and on return brought back grain for consumption in the desert than ever engaged in long-distance trade across the Sahara. The same was true of the nomadic trade in animal products from the Central Asian steppe (a vast, usually level and treeless tract) into China. A second pattern of caravan use was the relatively short-distance provisioning of urban centers with foodstuffs, such as in the massive system of ox-driven caravans that fed the city of Delhi, India, during the Mughal Empire.

Economic Pressure

Through the early modern centuries the increase in the volume of maritime trade and the coincident decline in per-unit transport costs put economic pressure on the overland trade routes. The caravan trade survived into the late nineteenth and early twentieth centuries only in interior regions where geographic isolation protected it from competition from the maritime sector. However, later during the twentieth century the caravan trade died off, outcompeted by the lower cost of transporting goods overland by truck or

railroad. During the same period the nomadic world dramatically contracted in size and influence.

Carrying Capacity

The growth of a population in a given environment is theoretically limited by the availability of resources and susceptibility to disease or disaster, thus the maximum number or density of organisms an area can support is called the *carrying capacity*. The threshold for humans is unknown, because they respond to scarcity by moving to new areas, adopting new resources, or inventing technologies to increase capacity.

Carrying capacity is the theoretical limit on the size of a population of any organism that a given environment of defined size can support indefinitely. The limit is usually stated in terms of the food supply, but density-dependent diseases have probably been the most important factor in limiting many animal and human populations through most of history. Other limiting factors may have included specific nutrients or water, or even physiological responses to the psychological stresses of high population density. The “law of the minimum” suggests that the limit will be set by whichever resource is in shortest supply or is activated at the lowest population density.

If food is the limiting resource, as is usually assumed, any population of food consumers is limited by the regenerative capacity of its food supply. If the consuming animal eats only the amount regenerated, (if, for example, wolves eat only as many sheep as are born each year, or the sheep eat grass only as fast as it can regenerate), the consumers and the food supply can theoretically coexist forever in equilibrium (unless the environment itself changes). The equilibrium may be static or may involve interrelated fluctuations in the size of the two populations, as when, for example, wolves deplete the sheep population and then

decline in numbers themselves, which then permits the sheep to regenerate. If the consumer continues to eat more of its prey than the prey can regenerate, the population of prey and therefore of consumers will be reduced conceivably to extinction. Exceeding carrying capacity may result either in excessive mortality among consumers, in reduced fertility from malnutrition or disease, or in both. Density-related social dynamics among the consumers may also affect both mortality and fertility. The same principles apply to specific isolated human populations subsisting on limited resources (as in the Arctic or extreme deserts) where there is nowhere else to go, no alternative resources, limited ability to move food, and limited ability of the human group to enhance the growth of its resources.

Carrying Capacity Applied to Human Beings

How important carrying capacity has been in human history is a matter of debate. A Malthusian perspective implies the importance of carrying capacity by arguing that human populations are—and by inference have been—limited by food-related technology that expands only through fortuitous human invention. Thomas Malthus (1766–1834) argued that the human population cannot expand indefinitely because it will inevitably outstrip its food supply. Humans will eat beyond Earth’s technologically enhanced carrying capacity, with dire consequences.

Although Malthus may be right about the long-term future, he was clearly wrong about much of human history to date and for the near future. The carrying capacity concept clearly has not applied overall and in

Buffalo berry gatherers in Mandan. Photo by Edward S. Curtis (1868–1952). Any population of food consumers is limited by the regenerative capacity of its food supply. Library of Congress.

the long run to the growth of our species as a whole (although it has almost certainly applied locally and in the short run).

People are omnivores who eat an extraordinarily wide (and still expanding) range of foods. We respond to shortage by expanding the breadth of our diets. (Few human populations consume all of the edible resources within range until forced to do so by hunger.) We also can increase the range of environments we occupy, and we can move food from place to place. Most important, we have demonstrated an enormous capacity to increase food supplies by investing additional effort in obtaining and processing them.

A controversy exists about the relative importance of supply and demand as determinants of human food supplies in human history. Many scholars believe that Malthus profoundly underestimated the ability of growing populations themselves to force changes in food choices, technology, and related behaviors. Throughout history, the human population has made adjustments that have ultimately resulted in

the adoption (more than invention) of new technology. If demand can push supply, the meaning of carrying capacity as a fixed limit must be questioned.

Evidence for the importance of economic demand in human history comes in many forms. New foods eaten have often been less palatable, less nutritious, and harder to obtain than those they supplemented—and therefore unlikely to have been adopted just because they had been discovered or new technology invented. Many new environments colonized were clearly not preferred (deserts, tropical rain forests, and the Arctic) and would not have been colonized voluntarily. Many new technologies or steps taken to improve food supplies resulted in declining quality of food or declining efficiency of food-getting techniques. Much of the history of evolving economies seems to have involved diminishing returns, particularly in the quality of human health and nutrition.

Carrying Capacity for Foraging Peoples

Between 100,000 and about 12,000 years ago the human population consisted of foragers, small populations of whom survived into recent centuries and even into the present in forms modified by outside contact. These groups are mobile, live at low population density, and eat fresh wild foods. Malnutrition is quite rare among modern foragers and appears to have been rare among foragers in the past, but becomes increasingly important as populations grow and “progress” to new food resources and new technologies. Ancient and historic foragers also have been relatively disease-free, because low population densities and periodic movement prevent many infectious diseases from spreading or minimize their impact. The disease burden has clearly increased with increasing population density through human history. Major epidemic diseases such as smallpox are clearly of relatively modern origin. Modern peasants and the poor enjoy nowhere near foragers’ standard of nutrition and health.

Various studies show that large game is among the highest quality and most easily exploited of resources

Pieter Brueghel the Younger, *A Village Landscape with Farmers* (1634). Oil on panel. Humans respond to scarcity by moving to new areas, adopting new resources, or inventing technologies.

when available. But large game occupies large territories and is depleted easily. Early human foragers' diets apparently included a relatively high proportion of large game; human hunters may have hunted many large mammals to extinction before falling back on secondary resources.

Early in prehistory population growth was extremely slow, absorbed mostly by territorial expansion. The slow growth probably resulted mostly from low fertility or birth control (since the life expectancy of such groups equaled that of later populations that grew much faster). As population densities increased, the role of infectious disease as a limit to populations increased. Malthusian constraints resulting from food shortages may also have been operating in specific times and places, but hunger and starvation may actually have increased in frequency and severity in later, non-foraging populations. Slow growth might also have been the result of population mechanisms geared not so much to the ultimate carrying capacity of natural resources as to the "carrying capacity" of choices defined by preferred labor inputs and food choices, or even of personal space.

As populations grew increasingly in the last 20,000 years, the territory available to each group declined, and large mammals became scarce, to the point where groups were ultimately forced to broaden their diets to include a wider range of more prolific resources (a wider range of vegetable foods, birds, small mammals, fish, and shellfish), resulting in an increase in the carrying capacity of each unit of land. But the new resources were apparently less desirable foods, less nutritious, and more difficult to exploit, thus commonly consumed only as preferred resources were exhausted. Our ancestors probably adopted, rather than invented, new technologies such as fish hooks, grindstones, and arrows suitable for exploiting smaller game that were obvious or long-known but unused until needed rather than being confined by the limits of fortuitous economic invention independent of need.

Wild small seeds, including cereals, were apparently very low on the list of preferred foods. They raise the carrying capacity of each unit of land but are not particularly nutritious and are very difficult to convert to food. (Even today, cereal grains and tubers

Population, when unchecked, increases in a geometrical ratio. • Thomas Robert Malthus (1766–1834)

are staples primarily for the poor, because they are plentiful and cheap.)

Carrying Capacity after the Adoption of Agriculture

Agriculture and the domestication of plants, first adopted about 10,000 years ago, are usually considered major inventions that further raised the productivity of land and permitted groups to become sedentary. They apparently resulted in a slight increase in the rate of population growth, probably not from increased life expectancy but from greater fertility and/or altered birth control choices. But they, too, may have been a concession to increased population density. They clearly further lowered the quality of nutrition and may have increased labor demands.

On the one hand, sedentism and the ability to store food may have helped smooth out seasonal fluctuation and bottlenecks in the food supply; on the other, storage anchored populations to the vicinity of their stores, perhaps making those populations more vulnerable to crop failure, especially as domesticated crops modified for human use are often less suited to natural survival than their wild ancestors and hence more vulnerable to disease and pests. The concept of storing foods restricted diets to storable resources, but stored foods lose nutrients during storage, and actual physical losses of stored food (due, for example, to spoilage) threatened the reliability of the whole enterprise. Reliance on stored resources also increased people's vulnerability to expropriation of stored resources by others, while sedentism also exposed populations to increased infection risks.

Common reconstructions hold that among established farmers, the invention of new tools or exploitation of new technologies—the hoe, the plow, draft animals, fertilizers, and irrigation—increased the carrying capacity of land and made labor more efficient. A more controversial thesis holds that methods of farming involving plentiful supplies of

land and low population densities may have been more efficient than the more intensive methods associated with increased population density. Denser populations require increasing the productivity of land by shortening the periods of time that the land lies fallow, which in turn may necessitate the adoption of new tools. It is possible, therefore, that both before and after the adoption of agriculture, demand and labor investment, not technological “progress,” may have been the engine of economic growth. The idea of a fixed ceiling on resources modifiable only by fortuitous invention independent of need would then have little explanatory power.

Carrying Capacity in Recent Centuries

Artificial Malthusian constraints on population clearly became important with the emergence of civilization, because ruling classes (a defining feature of civilization) can withhold food from the lower classes and prevent them from generating demand for food. (Demand implies both desire or need and the ability to produce, pay for, or otherwise command food.) Hunger in the modern world among bountiful food supplies results from the inability of the poor to pay for food. Many argue that solutions to world hunger at present relate to the distribution of wealth, not natural Malthusian limits.

Moreover, in recent centuries, the growth of the world population has accelerated markedly. Nor can that growth be attributed to modern medicine's reducing human mortality, as it began well before the advent of modern medicine. Some argue that high growth rates are not a property of so-called primitive groups—that is, groups that depend on a high birth rate to assure their survival—but are a conscious response to the demands of colonial or world systems. If or when new efforts and new technology become necessary to feed the world's population, the implementation of those new technologies will depend on the degree to which the rich concern themselves with the poor. If that is the case, then increases in food

technology are indeed independent of population and demand.

Ultimate Human Carrying Capacity of Earth

In the long run, demographers generally estimate the ultimate carrying capacity of Earth at 10–70 billion people (although some estimates are much higher.) The modern world population as of 2010 is approximately 6.8 billion. The variation in those estimates is due in part to different assumptions about the ability and willingness of human populations to exert more effort, employ new technologies, eat new foods, and accept lower standards of living.

But the human carrying capacity of Earth may well ultimately be measured not by food resources but by the limited supply of some other necessary resource. Fresh water is already in short supply, and that supply can be enhanced only at great cost. Carrying capacity might also be defined ultimately by the highest density that a human population can reach before it triggers an unstoppable epidemic of infectious disease—probably the most important limit on population for the foreseeable future. And it may well be defined by the limits of the capacity of social organization to mitigate social and psychological stresses brought on by declining personal space.

Cartography

Maps of all types, whether depicting location, topography, or historical patterns and trends, are considered an essential tool for explaining and understanding world history. Key concepts of cartography, such as scale and projection, determine how a map is viewed and can often result in distortions. New technologies that allow for more accurate mapping techniques may eventually lead to better understanding of global historical development.

Historians have used maps to portray the geographical patterns of the past for hundreds of years. Chinese historical cartography dates back at least to the Song dynasty (960–1279). Europeans made historical maps of their Holy Lands, based on biblical sources, as early as the fourth century. The first historical atlas is sometimes attributed to

Abraham Ortelius (1527–1598), who included sets of historically focused maps in the later editions of his *Theatrum Orbis Terrarum* (first published in 1570).

Such early exercises in historical mapping, however, were not conducted on the global scale that informs modern world history. Not only was the Earth incompletely known, but the ethnocentric principle of geographic construction ensured that such projects focused on the cartographers' own homelands and, more generally, civilizations. Gradually, however, the mapping of historical patterns has become less parochial. The *DK World History Atlas*, for example, published in 2005 by Dorling Kindersley, is at pains to take a global perspective and to avoid Eurocentrism.

Although the most inclusive use of cartography in world history is encountered in historical atlases, maps are deployed by world historians in a variety

Map 1. Ptolemy Map. Created by the Alexandrian geographer, astronomer, and mathematician Claudius Ptolemy in the second century CE, this map reflects the known inhabited world at the time, shown extending mainly east to west with the Indian Ocean as an inland sea. The map became popular in the fifteenth century when it was reproduced several times and printed via moveable type.

Map 2. *Mappe-Monde* of St. Sever. Created between 780 and 980, this map exemplifies an early Christian world map oriented with “east” at the top, Europe to the left, and Africa to the right.

of other circumstances. All world history textbooks contain maps, as do many scholarly monographs that focus on world history. World history lends itself to mapping because it is by necessity geographical; world historians have to discuss a large array of different places, noting how they are both connected to, and differentiated from, one another. The most economical and elegant way to depict such spatial differentiation and integration is through cartography.

Essential Cartographic Concepts

A key cartographical concept is that of scale, the level of reduction from the actual space covered to its representation on paper. In a map scaled one to one million (at a ratio, in other words, of 1 to 1,000,000), a centimeter on the map represents a million centimeters on the Earth. Counterintuitively, large-scale maps cover

small areas while small-scale maps cover large areas. World historians typically employ small-scale maps, often operating at the global level of resolution. Most world historical atlases actually have a regional focus, interspersing maps of the entire planet among more numerous presentations scaled at the continental or subcontinental level. Several maps of early modern Europe, for example, may be followed first by portrayals of East Asia and then South Asia during the same period and subsequently by depictions of global trade routes and imperial expansion.

A second signal cartographic concept is that of projection. In projecting the curved surface of the Earth on a flat sheet of paper, distortions—whether of shape, size, distance, or direction—necessarily result. Mathematical techniques have allowed cartographers to devise hundreds of different projections, each of which warps the image in its own particular

It is not down in any map; true places never are. • Herman Melville (1819–1891)

Map 3. Idrisi Map. Reconstructed in the middle of the twelfth century from the writing of Muslim geographer Abu Abdullah Muhammad Ibn al-Sharif al-Idrisi, this map, like many Islamic maps of the period, was based on the ideas of Ptolemy (see Map 1) combined with knowledge Arabs gained through travel and expansion.

way. Inadequate attention to the challenges posed by projection has led to poorly conceived historical maps. Many of these have used Gerardus Mercator's eponymous projection of 1569. Although invaluable for navigators (it is the only map projection on which a constant compass bearing can be plotted as a straight line), the Mercator projection grossly exaggerates the extent of high-latitude areas, such as Europe. As a result, critical scholars have argued that it serves in the end as a kind of visual propaganda for Eurocentrism.

Even the vantage point from which maps are constructed leads to necessarily skewed images of the world. In the typical equatorially oriented world map, for example, the oceans all appear to occupy discrete basins, whereas a map projection focused on the South Pole reveals the broadly interconnected oceans as mere embayments of a global sea. Several recent world historical atlases experiment with multiple and novel map projections, both at the global and regional scales, allowing viewers to picture spatial relations in

fresh and arresting ways. Such maps sometimes dispense with seemingly natural yet purely conventional cartographic protocols, such as situating north at the top of the page.

Distributional Maps: Problems of Sovereignty

Historians use a wide variety of map types to illustrate the past. Simple locational maps are often employed to indicate the positions of places mentioned in the text. More complex versions of this sort of map add topography and other natural features. In the *Barrington Atlas of the Greek and Roman World* (2000), detailed physical maps, containing a large array of precisely located place names, depict the landscapes of antiquity, much as one would find in an atlas of the present-day world. More often, however, the maps employed by world historians reveal the distributional patterns of specific phenomena. The most commonly depicted patterns are those of

Map 4. Anglo-Saxon Map. This tenth-century map, perhaps the most accurate map produced by Christian Europe before the 1200s, shows considerable attention to detail.

Map 5. The Turin Map of the 11th Century. This old and simple Christian map of the world shows Adam, Eve, and the serpent at the top. It gives special attention to physical features including mountains, rivers, and winds.

political geography, bounding the territories of kingdoms, empires, and other polities of the past. Historically minded cartographers also map the spatial configurations of religious adherence, economic organization, population density, and many other aspects of social life. Less often encountered in world history are thematic maps that depict statistical variations of particular phenomena over space, since gathering the requisite quantitative data over large areas for earlier times is difficult at best.

The common focus on political organization reveals one of the most intractable problems in historical mapping: that of projecting the geographical patterns of the present onto the past. Almost all atlases of world history are dominated by maps depicting, with bright colors, neatly bounded polities, much like those found in political maps of the modern world. Before the nineteenth century, however, few states were in fact clearly bounded in space. Most were characterized by a gradual diminution of

Map 6. The Spanish-Arabic Map of 1109. The original is brightly colored and represents Christian and Muslim ideas about the world. It is noticeably cruder than earlier maps, with the Earth depicted as square and surrounded by water.

sovereignty with distance from core areas. Instead of clean borders, one would have found broad frontiers of ambiguous, or overlapping, political affiliation. A related difficulty, most glaringly apparent in the case of early modern European empires, is that of hypothetical sovereignty. Spain, for example, did indeed claim control over vast expanses of North America in the late eighteenth century, as is reflected in most maps depicting that period. In practice, however, the Spanish monarchy exercised power over only a few minor outposts in those vast territories located in what is now the United States.

Unfortunately, it is difficult to depict the complex spatial patterns of sovereignty that characterized the premodern world. The black-and-white maps to which most authors are limited are almost never adequate, and even the full color maps of world history atlases seldom prove equal to the task. Only regionally focused historical atlases, such as Joseph Schwartzberg's exemplary *A Historical Atlas of South Asia* (1993), allow the concerted attention to detail that is needed to address this thorny issue.

Mapping Dynamic Patterns

Political-historical maps, however they are drafted, primarily depict differences among places. If such spatial differentiation is one of the fundamental aspects of geography, the other is spatial integration, or the connections that bind places together. World historians are increasingly interested in this latter, more process-oriented, form of representation. Rather than stressing boundaries, maps of integration typically portray routes, often depicted by arrows. The routes in question may be trade circuits, lines of diffusion (whether of innovations or diseases), migration pathways, courses of exploration, or paths of invasion; roads, canals, and shipping routes are often prominently displayed. Such maps are often dynamic in orientation, illustrating movement over time. A wide variety of hybrid maps, such as those overlaying trade routes across politically marked territories, are also commonly used.

In the final analysis, all cartographic representations of the past are at least implicitly designed to suggest change over time. To be sure, most maps

Map 7. The Psalter Map of the 13th Century. This map is a good example of the circular world maps of medieval Europe. Christian themes and legends are an integral part of such maps. Christ is at the top and Jerusalem in the center.

found in world history texts and atlases present snap-shots, illustrating conditions as they supposedly existed at a particular date. A sense of dynamism can be gained, however, by comparing maps depicting conditions in one period with maps of the same area in earlier or later periods. More ambitious cartography attempts to incorporate historical change within a single representation. In regard to political mapping, this is most easily done for polities that exhibited prolonged expansion. The growth of the Roman or Ottoman empires, for example, can fairly easily be shown by using different colors or shades to represent territorial accretions made during particular periods. One can also map contraction in much the same way, as with the often-mapped diminution and eventual disappearance of Poland in the eighteenth century. It is very difficult, however, to show complex territorial changes, exhibiting episodes of both growth and retrenchment, on a single

rendering. Maps of this sort tend to be so complex that they can be more confusing than edifying.

Political Implications and Motivations

Like other forms of mapping, historical cartography is often influenced, consciously or not, by ideological commitments. Maps necessarily demand the exclusion of information (a totally comprehensive map, it has often been remarked, would have to be constructed at a 1 to 1 scale, rendering it useless). What the cartographer chooses to portray depends on what he or she considers important, which in turn is influenced by his or her political outlook. A left-leaning scholar, for example, might be more inclined to map peasant rebellions than a right-leaning scholar, who in turn might be more concerned with great-power politics. Political sea changes in academia have thus influenced our cartographical portrayals of the past; maps of rural insurrections, for example, are much more common today than they were in earlier generations.

Nationalist ideology, coupled with devotion to one's own "civilization," has also profoundly shaped the construction of global historical maps. World history atlases produced in Germany, for example, contain more portrayals of Germany and of Europe than those produced in Japan, which, correspondingly, focus more on Japan and East Asia. The academic development of world history as a discrete field of study over the past several decades has, however, countered such parochialism, nurturing instead a globalist vision.

But regardless of such recent progress, cartography has often been put to clearly nationalistic purposes in the past. In Nazi Germany, for example, mapmakers strove to magnify the extent of the German Reich during various historical epochs. At the extreme of politicization one finds propaganda maps, such as the early Nazi productions that depicted Czechoslovakia as a fist striking into the heart of the German geographical body. Today it is not uncommon to find anachronistic political maps of the present-day world that show, without acknowledgement, territorial dreams rather than realities. National maps made in India and Pakistan, for example, usually append

Map 8. The Laurentian Portolano of 1351. This Italian map is notable for its precise depiction Europe and Asia but especially Africa, representing the continent more accurately than any European map up to that time.

all of Jammu and Kashmir to their respective national territories, rather than merely those portions of the region that they actually control.

The use of mapping for such nationalistic and imperialistic purposes has led some scholars to conclude that cartography, whether depicting the past or the present, is primarily a projection of power. Although this thesis is probably exaggerated, matters of state power do infuse many mapping projects. National atlases, for example, emerged as important sites in which to illustrate the themes of national unity, diversity, and historical cohesion. But if the national polities take advantage of maps for their nation-building agendas, so too, in recent times, do members of various small-scale societies, who have learned to employ modern cartographic techniques to define and defend their own historically constituted homelands against encroachment by private interests and state power. Cartography is thus perhaps best seen as a flexible methodology that can serve almost any purpose.

Historical Maps in World History

World historians can use any source of spatial information in order to construct maps. Certain records of the past, however, prove particularly useful. Gazetteers, a genre that was traditionally highly developed in east Asia, organize data in an explicitly geographical framework and hence lend themselves to cartographic presentation. Equally valuable are actual maps made in earlier periods. By examining historical maps, scholars can determine the spatial knowledge that was available and the geographical conceptions that were prevalent in the period under consideration.

Perhaps the most innovative use of historical cartography in a work of world history is Thongchai Winichakul's *Siam Mapped: A History of the Geo-Body of a Nation* (1994). While Thongchai's focus is Thailand (formerly Siam), his frame is necessarily global in that he is concerned with Thailand's maintenance of independence and its construction of a modern state in the face of French and British imperial aggression.

The earliest extant map of Ming dynasty (1368–1644) Jiangxi Province depicts in precise detail elements of the natural landscape as well as moats, temples, villages, and houses.

Mapping, he argues, was central to this project. The Thai government had to delineate precise boundaries in areas that had previously been ambiguous frontier zones, just as it had to thoroughly map its own internal districts in order to administer them in the modern style. To understand this crucial episode in both Thai and world history, Thongchai found that it was necessary to examine in detail both early maps and their cartographic production techniques.

New Cartographic Techniques

During the twentieth and early twenty-first centuries, advances in cartographic methods have allowed mapmakers to create ever more exact and flexible depictions of the Earth's surface. Although historical cartography has hardly been at the forefront of these technological developments, world historians have put them to good use. Aerial photography was harnessed to the mapmaking effort in the early twentieth century, to be followed at mid-century by satellite imagery. The late twentieth century saw the development of a host of computer-aided techniques

for both making and comparing maps. Novel map forms, such as the cartogram (in which the size of different areas varies in proportion to some measurable feature, such as population) could now be easily generated with the proper software. The same is true, moreover, in regard to unusual map projections. But the most significant cartographic advance of the late twentieth century was the development of Geographic Information Systems (GIS). GIS weds mapping to computerized databases, allowing the ready construction of a large number of map overlays. GIS is particularly relevant for world historical projects focused on the nineteenth and twentieth centuries, when many forms of quantitative data that can be digitized become available. A related technique is animated cartography. Animated cartography makes it possible to portray changes in distributional patterns over time as continuous transformations, much as is done in conventional animation. Animations of the spatial extension of a single phenomenon, such as the spread of Islam during and after the seventh century, are a particularly effective form of world historical pedagogy.

Cartography, in both its traditional and technologically mediated forms, is a powerful tool for portraying and analyzing world historical patterns and processes. If anything, world historians have underutilized mapping and other forms of graphical presentation in favor of textual approaches. By further linking the techniques and concerns of geography with those of history, a richer and more sophisticated understanding of global historical development may someday be gained.

Catherine the Great

(1729–1796)

EMPRESS OF RUSSIA

Although she was well known for her skilled foreign policy, the German-born Catherine the Great, who ruled Russia from 1762 until 1796, may have been equally well known for her promiscuity and the controversy surrounding her seizure of power. She opened schools to women and granted freedom to the wealthy but refused to abolish serfdom.

Catherine II, also called Catherine the Great, a German princess who married into the Russian royal family, is one of most important leaders in Russia's history. She is well known in the Western world because of her extremely active extramarital love life and because she is speculated to have taken over Russia's throne by killing her husband, Peter III (1728–1762). During her thirty-four-year reign (1762–1796), Catherine the Great ruled as the most powerful and important autocrat in Russia since Peter the Great (1672–1725).

Sophie Friederike Auguste von Anhalt-Zerbst, later Catherine the Great, was born in 1729 to two minor German royals who had no real power or fame. As Sophie grew up, she exhibited a great intelligence. She had a strong tendency toward rational thinking and frequently enraged her tutor by trying to find logical explanations for sacred dogmas. Later, this way of thinking manifested itself in Catherine's passion for Enlightenment philosophy.

In 1744, Sophie's life changed forever when she was invited to St. Petersburg by Empress Elizabeth (1709–1762), who reigned as Russia's czar from 1741–1762, to meet her nephew, Karl Peter Ulrich, later Peter III, the heir to Russia's throne. Upon meeting Sophie, the empress discovered many excellent reasons to choose

her for Peter's bride. Because Sophie's family was so obscure, the empress thought that Sophie would easily renounce her German allegiance. In addition, Sophie was Protestant, and therefore thought to be more willing to convert to the Russian Orthodox faith. True to the empress's supposition, Sophie willingly converted to Russian Orthodoxy and was given the new name Yekaterina (Catherine) Alekseyevna.

In 1745, Catherine married Peter III. Peter III had grown up in Germany and considered himself to be German in every respect. He had an intense dislike for all things Russian. He also hated his wife who, although of German blood, considered herself to be Russian. Catherine, in return, hated her husband. They had one child, Paul (1754–1801), who was raised entirely by Empress Elizabeth. With no real purpose at home or at court, Catherine became restless. She began to take extramarital lovers. There is even some debate as to whether Peter III was Paul's biological father.

On 25 December 1761, Empress Elizabeth died and Peter III was crowned czar. Quickly, he lost favor with his subjects. Upon coming to power, Peter spoke mostly German. He made horrible jokes about Russians. He even changed the Russian army's uniform to look more German. The worst of Peter's early actions, however, came in 1762. Before her death, Empress Elizabeth had been fighting a war with Prussia; after her death, Peter III signed a treaty restoring power to the Prussian king. This stolen victory cemented Peter III's unpopularity with the Russian people.

On 28 June 1762, Catherine initiated an instant, bloodless, and popular coup d'état. Peter, who did not try to resist, was captured and placed under

Portrait of Catherine II, also called Catherine the Great, painted in 1794. Oil on canvas.

The Hermitage, St. Petersburg, Russia.

house arrest. Several days later, he was mysteriously assassinated. Catherine denied complicity. There are a plethora theories about the circumstances under which the deposed czar was murdered. One speculation is that Peter's guards strangled him to death. Another hypothesis is that Catherine's lover killed him on Catherine's orders. Although the truth is not known, those closest to Catherine held that when Catherine received the news of her husband's death, she fainted. She later said, "My reputation is ruined! Never will posterity forgive me for this involuntary crime" (Troyat 1980, 137). Apparently, Catherine was not remotely sad about her husband's death; she was merely nervous about its repercussions on her political career. Publicly, the czar was said to have died of natural causes. Not one person disputed this claim.

When Catherine II came to power, she made it abundantly clear that she would not give up the

throne to her son when he came of age. Catharine's first real success was in foreign policy utilizing the Russian-Prussian alliance. In 1763, King Augustus III (1696–1763) of Poland died. The Russian-Prussian alliance backed the election of Catherine's former lover, Stanislaw II Augustus Poniatowski (1732–1798) to replace him. Because he had no royal ties, Poniatowski remained loyal to his Russian backers. This was a brilliant foreign policy move on Catherine's part. The first of three partitions of Poland had occurred. The second partition occurred in 1793. In 1795, the final Polish partition took place and Poland ceased to exist. Catherine had additional military victories in Turkey, where she led two successful wars in 1768–1774 and in 1787–1791. Those wars, in conjunction with the annexation of the Crimea in 1783, effectively removed the Tartar threat to Russian security and established Russian control over the northern coast of the Black Sea.

Catherine also initiated many influential domestic policies. She improved the dismal situation of women when, in 1783, she put Princess Dashkova (1744–1810) in charge of the Academy of Arts and Sciences. Princess Dashkova was the first woman who was not a part of the royal family to hold any position of power in Russia. In addition, Catherine opened up the first schools for women.

Catherine's main goal for Russia was to reorder and systemize its class structure. To that end, Catherine set out the 1785 Charter of the Towns, which stated that the more wealthy the individual, the more rights that individual would be granted. On the same day, she put out the Charter of the Nobility, which granted various freedoms to the nobility, including freedom from corporal punishment. While Catherine gave a great deal of rights and freedoms to the nobility, she did not free the serfs. About 90 percent of Russia's peasant class was serfs and, while Catherine was against serfdom, she did not abolish it. Catherine knew that the nobles would stop at nothing, including killing the czar, to prevent the end of serfdom.

On 6 November 1796, Catherine died and was succeeded by her son, Paul I. Throughout Catherine's life there had been a deep hatred between mother and son. When Paul came to power, his goal was to exact

I shall be an autocrat, that's my trade; and the good Lord will forgive me, that's his. • Catherine the Great (1729–1796)

revenge on his mother. He did this with his Law of Succession, which eliminated the possibility of any woman ever ruling Russia again. Catherine the Great, therefore, was truly the first and last of her kind, a unique leader in both Russian and world history.

The Celtic culture as we know it today presides in Ireland, Scotland, and Wales. But some scholars argue that all European cultures stem from ancient Celts, who migrated from what is now Eastern Europe to the British Isles in the ninth century BCE. Known for their military prowess and virtues that may have created the backbone of European chivalry, this rich culture maintains a strong interest for historians and the general public.

The designation “Celts” has traditionally referred to the groups of indigenous European peoples who first inhabited the southernmost reaches of contemporary Austria, Switzerland, and Germany in antiquity. From the ninth century BCE onward, these groups began to disperse widely throughout continental Europe and eventually reached Ireland, England, and Scotland. Although a strong claim cannot be made for the absolute uniformity of social customs among these groups, societal and linguistic affinities among them are sufficient to support the conclusion that they were part of a single cultural continuum.

An identifiable Celtic ethos appears to have emerged in Europe about 800 BCE north of the Alps. Many of its distinguishing practices were inherited from the earlier Urnfield culture (named for its practice of burying cremated remains of the deceased in urns), which flourished from about 1300 BCE to about 800 BCE. These practices included agriculture, metallurgy (particularly in bronze), carpentry, and the manufacture of textiles, weapons (swords, shields, and armor), utilitarian goods (wheels), household utensils (metal cooking ware), and items for personal

adornment (metal bracelets and brooches). Early Celts continued many of these practices. Through time they became known for their proficiency in the mining of ore, their mastery of iron technology, the richness of their folkloric and expressive traditions, their egalitarian view of the relationship between men and women, and their ingenuity.

Providing a precise terminus for the historical span of Celtic culture is a difficult task, in part because many of the culture’s features gradually became part of the national consciousness of those people now living in the United Kingdom and Europe. According to at least one estimate, by the seventh century CE the impact of Roman culture that spread under imperial protection as well as the mixture of ideas and value systems generated by migration and social contact resulted in the loss of a distinctively Celtic ethos in most of Europe. This loss did not occur in Brittany (a region in France), Wales, Scotland, and Ireland. In the United Kingdom, for example, Christianity provided one important institutional matrix within which Celtic traditions were both preserved and transformed from at least the second century CE onward. Nonetheless, some scholars contend that the number of identifiable cultural survivals is sufficient to make the claim that a Celtic core exists for most countries that are part of the European Union. As a result, in recent years many people have reclaimed parts of this heterogeneous tradition both in fashioning pan-European identities and in creating new religious practices that selectively appropriate older Celtic antecedents. Those areas in which the living stream of Celtic folkways and mores has continued to flow—and where vestiges of more archaic customs have been retained with less modern adaptation

than elsewhere in Europe—are confined to Wales, Scotland, Ireland, and parts of western France.

Beginnings

Early Greek sources, beginning during the sixth century BCE, first mention the *Keltoi* people, *Keltoi* being the word from which the English word *Celt* is ultimately derived. Latin sources from the first century BCE onward refer to these people as either *Galli* (from which the Roman word for present-day France—*Gaul*—comes) or *Celtae*. Recent scholarship has noted that Greco-Roman attitudes about the Celts were not monolithic and actually changed through time. During the sixth and fifth centuries BCE the Celts were seen as one of many known indigenous groups. Later, from the fourth to the second century BCE, they were seen as an immediate military threat and classified in pejorative terms. During the second and first centuries BCE they were seen simply as an anthropological curiosity.

Early Celtic culture reached its apex between the fifth and third centuries BCE, a period roughly corresponding with the emergence of the La Tène style of art. The style is named for the archaeological site near Lake Neuchâtel in Switzerland at which artifacts representing it were discovered. La Tène's highly evocative and abstract canons have exercised a profound influence on subsequent Celtic artistic conventions and practices. Highly imaginative representations of

the human form (for example, both the head and the full body) as well as flora, fauna, and creative designs are found on weapons, household utensils, and items used for personal adornment.

Common Traits

Although daily life among the disparate Celtic groups would have been partially shaped by the environmental requirements of their various locales, on the whole the groups appear to have held certain traits in common. Personal hygiene was crucial, and the Celts are credited with the invention of soap. Archaeologists have also discovered items such as mirrors, razors, and combs, indicating a concern for hair care and personal appearance. Both sexes preferred long hair, which women wore in braided pigtails. Men apparently shaved all facial hair, preserving only mustaches. Hunting (with the assistance of trained dogs), participating in competitive games, and feasting were also valued. Celts seem to have paid great attention to the preparation of food. They either boiled or roasted over charcoal meats such as pork and beef. They ate fish, bread, and dairy products. They collected honey, produced mead and beer, and imported wine. They used salt (which was mined in places such as Hallstatt, Austria) for seasoning and as a food preservative. The Celts must have encouraged moderation in consumption, particularly for men, who were expected to maintain optimal physical conditioning. Men and women wore the Celtic equivalent of pants, called *bracae*. Over these *bracae* women wore skirts. Other attire for both men and women included tunics, belts, cloaks, ornamental brooches (to fasten cloaks), and either leather shoes or sandals.

Their personal dwellings were made of wood or stone, and a Celtic city would often be fortified. Such cities, or *oppidas*, could be quite enormous, comprising 300 or more hectares. Married women maintained independence in several areas of life, one of which was the ownership of goods and the other of which was participation in civic life. Women controlled their own property when married, could be designated as tribal leaders, and were allowed to

participate fully in military activities. The Celts were known for their military prowess. Warriors were fond of one-to-one engagement on the battlefield, and standard equipment typically consisted of long sword, spear, lance, javelin, sling, bow, and shield. Celts also used horse-drawn chariots and musical instruments (i.e., the trumpet) in military operations. Heroism and other virtues associated with the conduct of war were cherished parts of the Celtic worldview. Scholars have suggested that such virtues would later become the backbone of European chivalric ideals. Celtic burial practices, which included interring the deceased with items used in daily life, indicate a belief in the continuation of life beyond the grave. Religious life was regulated by a special class of practitioners known as “druids” and seems to have centered on observance of festivals tied closely to the cycle of agricultural activities, and the Celtic pantheon contained numerous deities, many of which were female. Stewardship of Celtic folklore fell within the purview of bards,

who served as entertainers, social commentators, and guardians of historical and mythic traditions.

Given its richness, Celtic culture is likely to engage both popular imagination and scholarly imagination for some time to come.

Cereal Grains

Until humans learned to remove hulls from the seeds of certain grasses around 9000 BCE, nomadic human populations relied on hunting and gathering for sustenance. Cereal grains yielded large quantities of food from small fields, which meant they could support larger, sedentary populations; their storability and ease of transfer allowed humans to develop more complex societies and governments.

Grains are a human creation because they are simply those grasses (members of the botanical family Gramineae Juss [alternatively, Poaceae Nash]) whose seeds have been selected by humans as staple foodstuffs. The interaction between cereal grains and humans has been fundamental to both in their rise to dominance in their environments. Without cereal grains the human population would likely have remained small—it is estimated to have been less than 4 million in 10,000 BCE—just one species in a widely varied global fauna, instead of becoming the nearly 6.8 billion who in the twenty-first century pervade the environment of the Earth. More than three-quarters of human food today comes from cereal grains, either directly or indirectly as animal feed (one-third of the world's output of cereal grains is used as animal feed). (See table 1 for the increase in grain production since the 1960s.)

Equally, without humans the great cereal grains—wheat, barley, rice, maize—would have remained limited in range and distribution, just grasses among the roughly seven thousand species in the family Gramineae. Perhaps the greatest environmental shift brought about by grains is the shift of the dominant form of vegetation on the planet from trees to grasses.

Grains and Humans

The advantages of grains as foodstuffs have profoundly altered human culture. Grains, although not perfect foods, do contain large amounts of carbohydrates and small but important amounts of proteins (although certain proteins such as lysine are not available in the major grains and must be obtained from other sources). Historically, grains provided large quantities of foodstuffs in a small area—either in the dense wild stands in favorable locations or in the new fields of agriculture—which allowed a much denser human population to be supported in a limited area. This allowed permanent settlements of a size that hunting and gathering had not.

An essential part of the importance of grain is that it can be stored for lengthy periods (rice has been stored over one hundred years), thus providing nutrition throughout the year, compared to the practice of hunting and gathering, which must be carried on continually. Historically, because the labor of agriculture, although intense, was limited to certain seasons of the year, farmers could devote other portions of the year to increasingly sophisticated and specialized pursuits.

The storability of grain also made it a transferable basis of value. As a means of payment, grain made possible the specialization of labor because persons could develop skills and devote their entire time to the production of goods that could be traded to farmers for their surplus grain. In the earliest written records, of both Egypt and Mesopotamia, grain is the prevalent standard of exchange.

The storability and transferability of grain also made possible the beginning of government because

grain was a suitable means of taxation, and taxation is the essential feature of the transfer of wealth for common purposes, a defining feature of government. The earliest government processes probably developed as agriculture was carried from the open hills of Palestine, Syria, and the foothills of the Taurus and Zagros mountains down onto the floodplains of Egypt and Mesopotamia. After the few optimal natural sites had been taken, the scale of work to build and maintain irrigation systems would be beyond the ability of the individual or family. Collective organization would be required both to put irrigation in place and to allocate and protect possession of the irrigated fields.

From Grasses to Grains

The wild grains were not a major food of early humans because the seeds, over their desirable starch and protein, have an indigestible hull. Eating any substantial quantity of raw grains would have resulted in acute digestive discomfort (whereas natural grain eaters such as birds have digestive mechanisms to deal with the hull). Not until humans learned the use of tools and fire could they make use of grains. Bruising or grinding could loosen and remove part

of the hull, but it was application of heat, in “parching” or roasting, that was most effective in removing the hull and making the nutritious kernel available. After grains were in cultivation, selection toward “naked” seeded varieties made grains more readily usable.

Some archeologists have suggested that the mortars and pestles found in sites of the Natufian culture in the Fertile Crescent (the area from the southeastern coast of the Mediterranean Sea around the Syrian Desert north of the Arabian Peninsula to the Persian Gulf) from about 10,000 BCE are evidence that people there were gathering and using wild grains. However, because mortars and pestles can be used for grinding many other things than grains, it is better to see the first definite evidence of grain use as being about 9000 BCE, the date of the first archeological discoveries of carbonized grain in human-use contexts. Because fire appears to have been the main early tool for de-hulling wild grains, the lack of carbonized grains at earlier sites make earlier use questionable. Grain gathering encouraged permanent settlement rather than nomadism, so the first known villages arose in the prime grain-collecting arc of the Near East.

Reliance on a secure and concentrated food resource such as grain led the harvesters to try to protect it, driving off animals that were in competition with them for the ripe grain and clearing away plants (the first “weeds”) that might compete with and slow down the growth of the grain. Just when this grain “husbandry” changed to actual agriculture, with farmers selecting and saving seed between seasons, to sow in ground that they had plowed or otherwise loosened, is unknown. However, by about 8000 BCE seeds, altered from the wild strain by selection for tougher rachis, or central stem, (reducing shattering of the ear when gathering) and plumper grains, of emmer wheat (*Triticum turgidum* ssp. *dicoccum*), einkorn wheat (*Triticum monococcum*), and barley (*Hordeum vulgare*) turn up in early Neolithic sites such as Jericho, Tell Aswad, and Cafer Höyük. These are considered clear evidence of cultivation and selection away from the wild grain. By 7000 BCE modern bread wheat (*Triticum aestivum*) is also found.

A nineteenth-century African storage bin for cereals.

Middle East and Europe: Wheat and Its Associates

The original food grains (emmer and einkorn wheats and barley) were initially domesticated in their natural wild range habitat—the Near Eastern arc of open hillsides with yearly rainfall of more than 250 millimeters, lying between forest to the north and arid plains to the south. All of the early agricultural settlements arose in this area, but it is relatively limited. As the success of cultivation and population grew, farmers looked to artificially expand the range suitable for grains, thus starting the process of environmental alteration to suit grains that has continued from that time on. Moving north required clearing the forest because grains do not thrive in shade. Moving south required irrigation of the arid lands to provide sufficient moisture.

Mesopotamian population densities grew first in the low-lying delta area to the east, where the flat land allowed the seasonal waters to be distributed by a relatively simple system of canals. The Sumerian cities of Ur and Eridu, close to the coastline of the Persian Gulf, grew up first in the later fourth millennium BCE, then Uruk, Umma, and Larsa slightly farther inland on the delta. However, the heavy irrigation for annual grain crops caused the water table to rise, and evaporation deposited soluble salts in the soil and raised the

salinity of the groundwater. These events reduced the fertility of the soil. Between 2350 and 1850 BCE crop yields declined by almost half, and seed requirements more than doubled. This was despite a shift in crop concentration from wheat to barley, which is more salt tolerant. The result was a decline of both population and political power for the delta, with the weight of both shifting westward upstream to the river plain region of Mesopotamia, where cities such as Nippur, Kish, and Babylon rose from about 1800 BCE.

This central part of Mesopotamia had greater gradient, meaning that floods had more energy and that stronger and larger-scale canals were necessary to carry the irrigation water out of the river channels. The height of the canal system was reached during Sasanian times (226–651 CE). However, salinization, although less rapid, continued to be a problem. The large irrigation works were liable to break down in times of natural or human crisis, leaving large areas of land to revert to desert. This happened in the years after the Arab conquest of Mesopotamia in 637 CE, when high floods combined with political change caused the elaborate canal system to collapse by 1000 CE, greatly reducing the cultivated area and population in Mesopotamia.

In Egypt fewer problems arose. The annual flooding of the Nile River flushed the salts from the soil, and the grain crops watered by the flooding flourished, supporting long-term production, which continued robustly enough to allow export of much of the grain that fed the urban population of imperial Rome. Failure of the Nile floods could result in famine and chaos, however. It has been suggested that the break between the Old and New Kingdoms of Egypt was caused by repeated flood failures between 2200 and 2000 BCE.

The Near Eastern system of agriculture based on barley and wheat spread through the Mediterranean, southward to the Ethiopian plateau, and eastward to India, flourishing in the areas where conditions were similar to the original Near Eastern arc or where forest clearance readily made them so.

During late antiquity and the early medieval period the introduction of the heavy moldboard plow

Let nothing which can be treated by diet be treated by other means. • **Maimonides (1135–1204)**

allowed plowing and planting of the heavier and wetter northern soils of northern and western Europe. Previously the arable (suitable for cultivation) lands there tended to be confined to the uplands, where the soil was lighter and the forest thinner. Now, with the new plows available, there was a fresh assault on the forests of Britain, Germany, and central Europe as they were cut down to make plowland (such as the “assarts” of England). The net result was a loss of forest cover—England, originally a heavily forested country, gradually changed to open land—and the growth of population and shift of power to northern Europe. However, the more northern location meant greater emphasis on the “coarse” grains (barley, rye, and oats), which have shorter growth periods. Rye (*Secale cereale*) and oats (*Avena sativa*) had been of minor importance before but now became staples in the more northern parts of Europe. There were serious side-effects: ergot, a common fungus attacking rye, when eaten in contaminated bread, causes ergotism, called “St. Anthony’s Fire” in medieval times. The afflicted suffer convulsions and hallucinations, and many die. The modern psychoactive drug LSD was developed from one of the alkaloids in ergot.

The deforestation push continued eastward as German colonists moved into Prussia and eastern Europe during the tenth through the thirteenth centuries, converting the primitive forest to wheatland and enriching the Hanseatic League of northern European merchant towns, which prospered by selling the grain produced. Then, as the European powers expanded during the sixteenth through the nineteenth centuries, wheat conquered the world as an important part of the mechanism of colonial dominance in North and South America, southern Africa, and Australia.

Eastern Asia: Rice

Rice (*Oryza sativa*) is the most important of the world’s grains, being the staple food of almost half of the world’s population. Although rice can grow in a variety of environments, “paddy” or “wet” rice (grown in artificially flooded fields) accounts for about 75

percent of production. “Dryland” or “upland” rice accounts for 10 percent, and “deepwater” rice (grown in water depths of more than 50 centimeters) accounts for the remaining 15 percent. Wet rice cultivation has had the most visible environmental effect, with its leveled terraces and surrounding dikes rising far up the mountainsides, reshaping the landscapes of China and Indonesia.

Domesticated rice originated in the uplands region running through Assam, northern Burma (Myanmar), northern Thailand, southwestern China, and northern Vietnam. However, the earliest archeological finds of cultivated rice, dated to about 5000 BCE, are from Hemudu in the lower Yangzi region of central China. By 3000 BCE the range of rice cultivation had spread through southern China and the northern part of Southeast Asia. Rice cultivation reached India by about 1500 BCE and Japan by about 300 BCE.

The extension of rice into the equatorial zone did not take place until the discovery of photo-insensitive (day-length neutral) strains whose development did not depend on seasonal triggers. The spread to the Malay Peninsula and the Indonesian Archipelago was therefore rather later, probably not until the middle of the first millennium CE. There the shift from swidden (slash-and-burn) cultivation of dryland crops such as millet to *sawah* (wet rice) cultivation led to greater population densities (a field of 1 hectare could support a family). This allowed surpluses necessary for urban development and trade and therefore the appearance of powerful states such as Srivijaya (southeastern Sumatra, seventh to tenth centuries) and Majapahit and its precursors (Java, eighth to fifteenth centuries).

Rice was not the first agricultural crop in its realm—proso (*Panicum miliaceum*) and foxtail (*Setaria italica*) millets preceded it in China; Job’s tears (*Coix lachryma-jobi*), tubers, and fruits preceded it in southeastern Asia and Indonesia. However, over time rice became the preferred grain, replacing the other crops. Intensive rice cultivation, with an increase in population density and effects on social and political structures, started in China in the third century BCE, and rice as a dominant crop spread outward. As

a food it was so much preferred that huge quantities were traded or transferred to nonrice-growing areas. The Grand Canal system of China, over 1,000 kilometers long, was built in the early seventh century primarily to carry tax rice from the producing areas of the south to the Sui dynasty capital in Daxingcheng in northwestern China. In 1011 the Chinese Emperor Zhenzong ordered the distribution of a new kind of rice seed imported from Champa (in modern Vietnam). It had the advantages of maturing quickly, allowing double-cropping in some areas, and also was drought resistant and thus could be planted in higher and more northerly areas.

The spread of both rice cultivation and rice consumption has continued to the present. During the colonial era cheap bulk shipping opened vast commercial markets and caused ever-increasing conversion of land to rice production. For example, between 1855 and 1905 rice area and production in the Burmese delta multiplied roughly tenfold, exporting 1.8 million metric tons annually by 1905. In the past two decades rice has overtaken wheat as the most-produced food grain.

The Americas: Maize

Maize (*Zea mays*) is commonly known in North America as “corn” but is more fittingly referred to as “maize” because “corn” means any cereal grain in Britain and much of the rest of the world. The great cereal staple originating in the Americas, maize is high in carbohydrates and fats but low in certain proteins and vitamins. It made a successful staple when complemented in the diet with beans and squash, as it was and is in the Americas. During the post-Columbian era, maize was introduced to the Old World and adopted as a staple foodstuff—but without those complementary foods—and diseases such as pellagra (deficiency of vitamin C and nicotinic acid) and kwashiorkor (a protein deficiency) have been the result of heavy dependency on maize alone.

Maize is a heavy feeder, quickly depleting the soil of nutrients. Its cultivation in the Americas and later

in the Old World has encouraged the type of agriculture known as “shifting cultivation” (slash and burn), where an area of forest is cleared, maize is grown for a few seasons until the fertility of the soil is exhausted, then the field is abandoned, and the farmer moves on to clear new fields.

The origin of the cultivated species of maize has been debated among scientists for over a hundred years because modern maize is so highly developed, with tight-fitting husks completely covering the grain on the ear, that maize is no longer capable of dispersing its seeds without human assistance. Botanists did not find wild maize clearly ancestral to the cultivated plant; therefore, they speculated that maize was descended through chance mutation or human selection from other related plants that do grow wild, particularly one known as “teosinte.” However, the recent discovery in Mexico City of maize pollen over eighty thousand years old, dating long before human occupation of the continent, has swung the argument to the side of an original wild maize, rather than mutation or selection from teosinte.

The earliest evidence of human use of maize, either gathered from the wild or in the early stages of domestication, dates to about 5000 BCE in northern Mexico. By the third millennium BCE maize was definitely cultivated in northeastern Mexico and the southeastern United States. By about 1500 BCE the nixamalization process (soaking and cooking the grain with lime or wood ashes, which makes the grain easier to grind and enhances its protein value) had been discovered, increasing maize’s desirability as a foodstuff. Whether maize was transferred to the Andean region from Central America or separately domesticated there is uncertain, but from these two areas the cultivation of maize spread through most of the Americas, being the basis of agriculture and increased population wherever it spread.

Columbus discovered maize on his first voyage to America, and the seeds taken back were soon spread through the Old World. Maize became a major crop in Italy, the Balkans, the Near East, and as far as

China. In Africa, in particular, it became the staple crop of much of the continent.

Africa: Millets

Africa is different from the other continents in having not a single dominant grain, but rather a range of localized grains, most of which are categorized as millets. Millet is not a single grain species, but rather includes many small-grained species, from several genera, tolerant of high temperatures and low moisture. Millets are cultivated widely across Eurasia, especially in India and China, but are most prominent in sub-Saharan Africa, where the “imperial” grains are less dominant.

Domestication of grain crops appears to have occurred independently in various areas of Africa and rather later than on the other continents. Extensive gathering of wild grass seeds continued until about a hundred years ago.

The main crop of the Sahel (semidesert southern fringe of the Sahara Desert) and dry savanna is pearl millet (*Pennisetum typhoides*), which is most drought resistant of all millets. In the tall grass savanna, sorghum (*Sorghum bicolor*) is the most important food crop. Both pearl millet and sorghum were domesticated by 2000 BCE, and both were spread to India at an early date. The east African highlands have their own preferred grains: finger millet (*Eleusine coracana*) and teff (*Eragrostis tef*), the smallest seeded of all millets, which is the most popular food grain in Ethiopia but almost unknown outside that country.

Western Africa also has African rice (*Oryza glaberrima*), descended from wild rices that grew in water holes that dried up in the dry season. African rice is now largely replaced in cultivation by oriental rice. After 1492 maize also became an important food crop, especially in the southern half of Africa.

Imperial Grains

Three grains—wheat, maize, and rice—have most suited the conditions created by the European expansion of the sixteenth to eighteenth centuries and the

Industrial Revolution of the nineteenth and twentieth centuries. Urban growth in the industrializing nations was facilitated by the new global transportation networks. A major impetus for the growth of European colonial empires was the need for cheap foodstuffs for the factory workers of the European countries that no longer grew enough for their own needs. Also, in these colonies the emphasis shifted from subsistence farming to commercial cash-crop agriculture producing for export. This encouraged monoculture, with farmers in each region concentrating on the single crop that would yield them the highest monetary return. However, monoculture, in addition to creating “best conditions” for production of high yields, establishes “best conditions” for diseases and pests that live on the grains.

North American Wheat “Imperialism”

The case of the North America prairies may be taken as typical of the environmental results of the vast expansion and intensification of grain growing in the modern era. Similar results may be seen in other cases, such as Russia’s Virgin Lands development projects of the 1950s and 1960s, China’s agricultural and industrial Great Leap Forward of 1958–1961, and the jungle clearing still going on in Brazil.

From the start of European settlement in North America, there was concentration on wheat growing in New England and the central U.S. colonies. After the American Revolution, agricultural settlement, accompanied by massive deforestation, expanded across the Appalachian Mountains into the interior east of the Mississippi River. After the U.S. Civil War and after Confederation in Canada in 1867, the North American frontier moved westward onto the open Great Plains, ideal for grain monoculture. However, the northern areas, especially on the Canadian prairies, were restricted by climate to mixed farming because successful harvests of the most desired grain, wheat, were unreliable. However, new strains of wheat—such as Marquis wheat introduced in 1911, which ripened eight days faster than the previously standard Red Fife strain—allowed monoculture of wheat even in the North.

This World War I poster, created by Parker Cushman for the United States Food Administration in 1917, urges “little Americans” to do their bit for the war effort.

Between 1860 and 1913 the Great Plains turned to grain, largely wheat. The Great Plains became the great “bread basket,” supplying the hungry cities of Europe and providing capital for North American development. However, the cheap wheat from North America (and similar plantings in Argentina, Australia, and Russia) impoverished farmers in Europe and tended to drive the other traditional grains out of production in those countries.

The environmental effects of the wheat monoculture were both varied and significant. The Rocky Mountain locust (*Melanoplus spretus*) was one of the two major herbivores on the Great Plains in the 1870s (the other was the bison). By 1900 both were gone, unable to survive in the changed conditions. Not that farmers could rejoice, though, because other species of locusts and grasshoppers, previously insignificant, replaced them with equal voracity. Locusts and grasshoppers

today cause losses of more than \$100 million on the Canadian prairies alone and require hundreds of thousands of liters of insecticides for control.

The near-continuous planting of wheat, from northern Mexico through the prairie provinces of Canada, created ideal conditions for the rust fungus, which has established a yearly “migration” pattern of over 4,000 kilometers. Infection starts out each year in northern Mexico. Spores are blown northward through repeated generations. Rust cannot overwinter at the northern end of the wheat belt but arrives each year from the south; it cannot oversummer in the southern end, so spores must be blown southward in the fall to infect winter wheat there to start the next year’s cycle. Efforts have been made to defeat this cycle by breeding new “rust-resistant” cultivars (organisms originating and persisting under cultivation) of wheat, but each new version has only a limited usefulness until the rust evolves new strains that are not protected against.

The loss of the native grass cover (the prairie sod), destroyed by the annual plowing and harrowing, meant that when drought came, especially in those drier areas marginal for agriculture, the soil had nothing to hold it and blew in millions of tons. Desertification resulted from efforts to extend grain farming into ever more marginal areas. The first bout of droughts hit the U.S. central plains in the 1870s and 1880s, resulting in a short-term exodus of population. The area was resettled after a series of wetter years. Then came the drought years of the later 1920s and 1930s, resulting in the Dust Bowl of Oklahoma and surrounding states and the exodus from the parched region. Similar conditions prevailed in the Palliser triangle of southern Saskatchewan and Alberta, Canada, where grain yields dropped by over 75 percent.

In more recent years efforts to alleviate drought risks by irrigation have led to groundwater supplies rapidly being used up because wells need to be drilled deeper and deeper.

Scientific Breeding

From the late nineteenth century onward scientific breeding, based on genetic principles, superseded

older methods of new grain selection. This produced dramatic results such as Marquis wheat, which, with its shortened ripening time, allowed wheat monoculture on the Canadian prairies. In the 1930s the first “artificial” grain was created—triticale, a cross of wheat and rye—which was heralded as a new wonder grain because it contains more protein than either parent, but it has not lived up to the promises.

Since the 1940s selections of HYV (high-yield varieties) maize, rice, and dwarf wheat have driven what is known as the “Green Revolution,” aimed at tropical and subtropical areas of Asia, Africa, and Latin America. The Green Revolution led to great increases in production but required heavy use of machinery, fertilizer, and pesticides (leading to increased concentration of production in the hands of larger-scale and higher-capitalized farmers and to loss of strain diversity). Also, many of the new hybrids either had built-in sterility or did not breed true, so seed could not be saved but rather had to be bought.

Most recently, genetic modification (GM) techniques have allowed plant biotechnologists to create desired characteristics not available by conventional breeding by altering genes or introducing genes from other plant species. This has produced such plants as maize with built-in tolerance for herbicides, valuable for large-scale mechanized agriculture. But problems have arisen with the drift of these genes to other strains of maize and other unexpected results—maize strains with built-in defenses against harmful insects are also toxic to butterflies.

The commercialization of plant breeding has also led to issues over “ownership” of plant genetics and strains and limitations on genetic diversity as commercial operations, especially in the United States, have tried to pressure farmers around the world to use patented seed.

Although pollution from traditional agricultural activities has long existed, artificial fertilizers, synthetic pesticides, and herbicides brought into use during the twentieth century changed both the

nature and the scale of the problem. Because grains are the largest agricultural crops, grains have also accounted for the largest use of these chemicals. Soils themselves may be subject to damaging build-ups of these chemicals or their derivatives, but larger effects come from runoff and leaching into the water system. This is particularly the case with rice because its culture requires regular flooding and draining of the rice paddies. The “miracle rices” of the 1960s onward, which give best results only with heavy fertilization and pest control, have worsened the problem.

Charlemagne

(742–814 CE)

KING OF THE FRANKS AND EMPEROR IN WESTERN EUROPE

Charlemagne's influence in both political and social spheres was so great that historians have nicknamed him the "father of Europe." His use of military force and ability to improvise new systems expanded a struggling western Europe into a strong empire. Additionally, his emphasis on learning created a Carolingian Renaissance that helped form cultural identity in western Europe and laid the groundwork on which the Middle Ages flourished.

Charlemagne, whose name means Charles the Great, reshaped early medieval Europe by uniting most of Latin Christendom and contributing to the preservation of classical Latin learning, thereby laying the foundations for political and cultural developments in Europe for centuries to come. He ranks among the most important individuals—along with Heraclius of Byzantium, Muhammad, and Sui Wendi (founder of China's Sui dynasty)—who contributed to shaping the post-classical Eurasian world. The Latin form of his name, *Carolus*, gives us the adjective *Carolingian*, which describes his empire and the historical period.

Charles was the elder son of Pepin the Short and the grandson of Charles Martel, both rulers of the Franks, a West Germanic people occupying Gaul and some other lands west of the Rhine River. After a brief succession struggle following his father's death, Charles assumed control of the Frankish realm in 771 CE. He then embarked on the career of conquest and consolidation that earned him the cognomen "the Great." Nearly forty years of Charles's campaigning brought large new areas under Frankish rule. Charlemagne's efforts were crowned, literally,

on Christmas Day of 800 CE, when Pope Leo III bestowed the title of "Emperor of the Romans" on him. Even the Byzantines, to whom that title had previously been reserved, had to acknowledge Charlemagne's position as emperor in the West, for by this time he ruled virtually all of western Europe except Iberia and the British Isles. He died in January 814 CE, leaving his empire to his only son, Louis.

Charlemagne came of age at a time when western Europe was only a shadow of what it had been at the height of the Roman Empire: the economy was underdeveloped and currency was in short supply; communications were slow and difficult; literacy was at a low ebb; and political power had become both fragmented and privatized. Despite these unfavorable circumstances, Charlemagne's dominating physical presence, tirelessness, personal and political persuasiveness, and his ability to improvise systems of administration from limited resources allowed him to create a large empire through the use of military force. But the edifice proved fragile. The empire began to suffer from Viking invasions even before the king died, and factionalism increased during his son Louis's reign. When Louis died, in 840 CE, he divided the empire among his three sons, who fell to warring among themselves. The three kingdoms disintegrated rapidly thereafter, under combined internal and external stress.

Clearly, the fate of Charlemagne's empire is further evidence of the central role the king's person and personality had played in creating and maintaining it. Some of Charlemagne's administrative techniques, especially the granting of land ("fiefs") instead of a salary to his officials in return for their service and the use of itinerant royal inspectors to supervise those

Albrecht Dürer, *Emperor Charlemagne* (c. 1512). Oil and tempera on panel. Germanisches National Museum, Nuremberg.

landed local officials, survived in fragmented form as building blocks for the rulers of later ages. Above all, the emotional legacy of a powerful, just ruler and a unified Christendom survived as a political ideal for most of the Middle Ages in Europe. This emotional legacy was reinforced by Charlemagne's even more lasting achievements as a cultural leader.

Unlike the great majority of his contemporaries, Charlemagne believed he had a duty to rule for the benefit of his subjects, and he earnestly pursued the intellectual and spiritual improvement of his realm. He attracted scholars from across Europe to

his court, the most prominent being his biographer Einhard and the British monk Alcuin; he promoted church reform and supported missionary activity in conquered lands; he instituted educational reforms, especially at the level of monastic schools, whose transcriptions were responsible for the preservation of many classical texts; and his court instituted an important reform in handwriting, as the script of the time was nearly illegible. The Carolingian minuscule script that resulted was such a model of clarity that it became, through its revival by Renaissance scholars, the basis for modern print typefaces.

To have another language is to possess a second soul. • **Charlemagne (742–814)**

Charlemagne's impact on cultural affairs was perhaps even more striking than his political and military achievements, because he was trained in the latter but not the former. He learned to read only as an adult, and he never learned to write; yet he took a keen interest in literature, learning, and even Church doctrine. In addition to his native Germanic tongue, he knew Latin and a bit of Greek. Through his personal example and by providing a hospitable environment for scholars, he fostered what historians have come to call the Carolingian Renaissance, a crucial stage in the formation of the western European cultural identity. This achievement, made possible by the extent and influence of his empire, justifies Charlemagne's reputation as the "father of Europe."

Charles V

(1500–1558)

HOLY ROMAN EMPEROR

As heir to the Castilian crown and the Holy Roman Empire, Charles V inherited rule over a great deal of Europe in 1519. His refusal to delegate power, his rejection of Protestantism, and wars to the east and west left a fragile, bankrupt empire in the hands of his successor.

Charles V (b. Ghent, Belgium, 24 February 1500; d. Yuste, Spain, 21 September 1558) ruled over about 28 million subjects in Europe, or some 40 percent of the continent's population, from the time of his election as Holy Roman emperor on 28 June 1519 until he gradually abdicated power in the fall and winter of 1555–1556. Moreover, during his reign, Hernán Cortés conquered Mexico (1519), and Francisco Pizarro subjugated Peru (1530–1532). These expeditions were carried out in Charles's name, as both King Charles I of Castile and Holy Roman emperor. They led to the creation of colonies in the New World, ruled directly from Spain in the interest of the Castilian crown.

A series of dynastic events made Charles the sole heir of an extraordinarily large number of countries. His father, Philip the Handsome, son of the Holy Roman emperor Maximilian I, of the house of Habsburg, ruled over the Low Countries and then in 1504 also became king of Castile, on behalf of his wife Joan; he died in 1506. At the death of Charles's maternal grandfather Ferdinand, in 1516, Charles was to inherit the crowns of Castile and Aragon from Ferdinand and Isabella (who died in 1504), thus uniting for the first time the two Spanish kingdoms under a single ruler. Moreover, the Aragonese legacy also included the kingdoms of Sicily, Naples, and Sardinia,

as well as the Balearic Islands. Control over all these territories implied hegemonic power over the western Mediterranean. In September 1517, Charles arrived in Spain to be inaugurated by the *cortes* (assemblies of estates) of his various kingdoms. Having been educated in French, and being surrounded by councillors from his northern territories, he experienced great difficulties in gaining control of his situation and having his authority accepted. As a reaction against decades of bad governance and the intrusion of foreign councillors, revolts broke out in various cities in 1520, lasting until 1522.

The death of Charles's paternal grandfather, Holy Roman emperor Maximilian, raised a new challenge in 1519. Although other German princes, especially Elector Frederick the Wise of Saxony, might have been chosen to succeed him, the House of Habsburg strove to keep the title in the family. And although Ferdinand (the younger son of Philip the Handsome) might have been more available than his brother, the king of Spain, Sicily, Naples, and a variety of other lands, Charles nevertheless insisted on his primogeniture with the argument that the fearsome expansion of the Ottoman Turks required all Christendom to unite. Important political concessions were made to the electors and huge sums were spent to bribe them.

Charles managed with great difficulty to keep his empire together, even adding to it the duchy of Milan in 1535, and winning control over or alliances with the other powers in Italy, but he obviously was a victim of imperial overreaching. He tried to keep all decisions in his own hands, keeping in close contact by correspondence with members of his family

Seisenegger (court painter of King Ferdinand V in Augsburg), *Portrait of Charles V* (1532). Oil on canvas. Kunsthistorisches Museum, Vienna.

and the high-ranking noblemen he had installed as regents, governors general, viceroys, and councillors in the territories where he was unable to reside in person. Further, he was convinced that he had to deal with the most urgent matters personally, which forced him to travel around Europe nearly constantly. This created long delays in decision-making processes in the other territories (in which he was not currently traveling).

The main challenge to his authority arose from his ambition of keeping all his subjects loyal to the Catholic Church in a time when religious reformers were rapidly gaining followers, while the church hierarchy proved highly unwilling to understand the need to reform itself. Charles finally lost this battle, especially in the German Empire, where several princes turned to the Reformation for reasons that had as much to do with faith as with their desire for autonomy. He was late to understand the gravity of the challenge Luther had launched against him personally at the Diet of Worms in 1521, and slow to react to it, mostly because of the multiplicity of his duties. He saw no other method of dealing with the Reformation movement than to postpone decisions, make provisional concessions, and try to convince the pope to convene a general council. When the Council of Trent finally opened in 1545, its first decisions were totally unacceptable for the Protestants, who had been strengthening their positions for nearly three decades. Charles was never able to accept the Religious Peace of Augsburg that his brother Roman King Ferdinand (since 1531) negotiated with the Diet in 1555, and he sent his letter of abdication to the Diet during its meeting in 1555. However, they did not choose his younger brother as his successor until 1558.

The second major challenge of Charles's reign was the external military threat from France and the Ottoman Empire, sometimes even in conjunction with each other. His nearly continuous efforts to build fortresses and to mount campaigns with ever larger armies exhausted his subjects' resources, including those of his colonies, and finally left his successor Philip II—who succeeded him in his Spanish and Italian kingdoms and in the Low Countries—with a bankrupt state. Charles's reign showed the impossibility of keeping western Christendom united politically and ecclesiastically, and his failure to understand this caused his demise.

Child Nurture

Human populations sustain themselves through child nurture, the passing on of skills and rules for behavior. Villages, in which children learn by imitating adults, have historically been more nurture-friendly than cities. Projections of falling populations worldwide reflect the disruption of nurture in industrialized societies; the biological and cultural continuity of humankind remains at risk until a viable urban substitute for traditional village communities can be found.

We commonly take the succession of generations for granted. Ever since our species diverged from ancestral life forms between 200,000 and 130,000 years ago, children everywhere grew up to become very much like their parents. Behavioral change was never wholly absent, but came so slowly that continuity of experience—a “cake of custom,” as nineteenth-century anthropologists called it—united successive generations. Despite enormous local diversity, human populations sustained themselves successfully in radically different climates and continents. Local disasters were never so great as to reverse the long-range trend toward population increase.

Nurturing Environments

This continuity depended on reliable forms of nurture that allowed for passing on of time-tested skills and rules for personal and collective behavior to the rising generation. As long as the great majority of human beings lived in small, semiautonomous groups—first itinerant bands of hunters and gatherers, then in agricultural villages and pastoral nomadic communities—nurture took care of itself. The daily round of everyday

life allowed, indeed required, children to watch and learn to help their elders as the adults around them did whatever needed to be done. Within each family, imitation of parents and older children came naturally. Instruction and correction was inseparable from everyday work and play. Accordingly, within a few years helpless infants were transmuted, as it were automatically, into useful assistants and then into responsible adults capable of nurturing children just as effectively as they had been nurtured themselves.

To be sure not all was serene. There were always times of crisis when food ran short and people died of starvation and disease. Farmers were rather more vulnerable than hunters and gatherers whose food sources were more various and who were also less exposed to disease. For farmers, bad weather or blight might cause crops to fail, epidemic disease might break out, or armed raiders make off with the harvest. As a result, death and depopulation often ensued locally, but survivors remained after even the most severe disasters. Time and again they started up again, producing the food they needed in accustomed ways and giving birth to children who carried on more or less as before.

The Burden of Civilization

The rise of cities and civilization, beginning after 3500 BCE in few propitious environments where population was unusually dense, put a new burden on village life. City dwellers did not raise the food they consumed; instead they compelled villagers round about to part with a share of their harvest in return for always imperfect protection from disaster. Initially, specialized priests undertook to safeguard

Indigenous man, woman & child, an engraving of a 1654 drawing. In village societies throughout history and across cultures, children learn by imitating adults.

the rural population from supernatural anger by collecting a share of the harvest to sustain monumental temples where they propitiated the gods with prayer and splendid ceremonies.

Subsequently, when human raiding became a more serious threat, specialized warriors, equipped with expensive armor and metal weapons, undertook to protect the rural majority from outsiders, demanding part of the harvest for their support in return. Priests and warriors then proceeded to negotiate an unstable, ever-fluctuating balance of power (and flow of income) within the cities and civilizations of Eurasia and the Americas.

Simultaneously, artisans and merchants also carved out urban niches for themselves: only so could priests acquire precious goods to please the gods; only so could warriors secure the armor and weapons they required. That, of course, added to the number of humans dependent on food transferred from villagers to urban consumers by a combination of rents, taxes, and, just occasionally, sale of a metal tool or the like to villagers in return for food or some needed

raw material they were able to provide for city folk to use.

Tumultuous political rivalries and sporadic organized warfare ensued in all civilized lands. Warfare cost rural populations dearly. Nevertheless, the fabric of civilized society was sustained across millennia by flows of food and of manpower from hinterland villages to cities nearby. Food transfers were central and conspicuous. Manpower was just as important but less obvious, since most migrants came individually and voluntarily.

Cities seldom or never sustained their population biologically. Intensified lethal infections were, or soon became, too great. Without effective garbage disposal, contaminated water was the norm; and strangers bringing supplies of precious goods from afar carried with them whatever new infections were in circulation, even across long distances. A second reason for urban failure to reproduce was that most humble urban occupations were inimical to marriage and family formation. Masters seldom allowed domestic servants to marry and raise children, for example. Sailors and caravan attendants were always on the move and unlikely to form families of their own. In general, most unskilled migrants from the countryside probably found it hard to acquire sufficient income to raise children. Newcomers were especially liable to lethal infection and early death because they lacked childhood exposure to many urban infections.

Nurture-Sustainable Villages

What made cities and civilization sustainable was that village farmers married young and usually raised more children than were needed to keep the village going. In village communities traditional division of labor between men and women depended on marriage. From a very early age children began to contribute to family income by helping in the house and fields. Moreover, in old age parents could count on their adult children to look after them even when they could no longer do much useful work. Finally, the uncertainties of life, especially in infancy and old age, meant that a plurality of children was needed

to ensure sufficient family help lifelong. With such incentives, sexual instinct sufficed to guarantee high birth rates in nearly all villages, even, or especially, under precarious conditions, when sudden death from famine, disease or violence was commonplace.

But persistent rural fecundity carried risks of its own. In particular whenever war, famine, or pestilence failed to wreak their havoc for a decade or longer, land shortages were likely to arise. As children matured, apportioning rights to cultivate specific fields and gardens among a plurality of potential heirs was always problematic. Marriage involved formal transfer of land rights from one generation to the next. Parents of both bride and groom nearly always contributed to the support of each newly married pair through some sort of negotiated dowry or bride-price system. But dividing land sufficient to support a single family among numerous children was usually impracticable.

Sometimes fertile and unoccupied land existed within reach, and for a generation or two surplus children could make a good life by bringing it under cultivation, but such circumstances were unusual. Long term, the effect was to expand cultivated areas and civilizations at the expense of less formidable societies, but thinly inhabited and accessible frontier regions filled rather rapidly. Land shortage was merely postponed, not solved.

Sometimes new crops or some new technique could produce more food than before, allowing families to survive on less land. But that too was exceptional, usually meant harder work, and seldom assured a satisfactory livelihood for extra children within existing village boundaries.

When commercial connection with the wider world came on stream, villagers could sometimes use spare time to work at home, spinning or weaving for example, or making something else for sale in town. That assimilated their lives with those of town artisans who were dependent on market prices to earn enough money to feed themselves. Hybrid farmer-artisans tended to become more numerous as transport improved. The stark alternatives earlier generations of peasants had faced when land shortages arose blurred accordingly but never entirely disappeared.

But the gradual intensification of commercial farming and spread of artisan activity to the countryside also weakened village solidarity and diminished local independence. Some rural families got richer; some lost their land and became wage laborers working for someone else. Consequently, the social rivalries and economic inequalities of city life spread to villages in some degree or other. Having many children became not a guarantee of family security but a guarantee of poverty.

Affects of Migration

Peasant rebellions were a desperate form of response to such circumstances. Nearly always they failed, after provoking the horrors of civil war. A more common rural response was to send extra children off to seek their fortune in nearby towns and cities. There they competed with other rural immigrants for unskilled work and only occasionally established families of their own. Few ever attained a satisfying life in their new environment, yet their presence often sufficed to maintain urban populations and made sure nasty jobs were adequately staffed. In early times, voluntary recruitment from the countryside often fell short, whereupon urban populations regularly resorted to compulsion, bringing enslaved strangers from afar to do work no one would do voluntarily.

The balance between forcible enslavement and voluntary migration fluctuated irregularly. In Eurasia slavery tended to diminish as hinterlands expanded and filled with a prolific peasantry. But when the Americas were depopulated after 1492, primarily by wholesale transfers of Eurasian and African diseases, slavery expanded once more. Millions of enslaved Africans were carried across the Atlantic and compelled to work in American mines and on sugar and cotton plantations. Black slavery remained a basic feature of American societies until 1865 in the United States and was abolished in Brazil only in 1888. Its aftermath still lingers among us.

The long-range civilized record shows that nothing guarantees a stable balance between human numbers and the means of subsistence. Epidemics and warfare could reduce local populations drastically—by

a third or more within as little as two or three years. Thereupon, the resilience of village living restored human numbers time and again. In the long term, sporadic discoveries of new, more productive crops and improved techniques of cultivation, together with the creation of other forms of wealth, permitted total human numbers to creep upward. That record is truly amazing. Across the millennia we enlarged our control over Earth's energy flows as no other species has ever been able to do, thanks to our changeable behavior and restless ingenuity.

Looking at the Future: Statistics and Trends

Recently, the multiplication of human numbers reached a climax that is almost certain to remain unmatched in time to come. Environmental limits seem sure to prevent anything like the four-fold increase of human population that occurred in the twentieth century. Shortages of fresh water and of cultivable soil are already apparent in many parts of the Earth. Even more to the point, urbanized populations are not reproducing themselves today. The reasons are somewhat different from those that used to prevail, but are no less compelling.

Beginning a discussion of the future requires the help of a few figures. First of all, world population continues to grow at a decreasing, but still very rapid rate. United Nations estimates project that between 2000 and 2050 human numbers will swell by 2.6 billions—"a net increase larger than the total world population in 1950" (Demeny and McNichol 2006, 255). Subsequent numbers also come from this source. But U.N. demographers also project that in developed (that is, wealthy and urbanized) countries births will fall significantly short of deaths across the same period of time. Europe is the principal region where populations are failing to reproduce themselves today. In 2005, the total number of persons living in Europe was about 728 million—including millions of recent immigrants from poorer lands. By 2050 that total is projected to shrink to about 653 million, due to shortfall in births.

Disruptive Patterns

What lies behind these statistical facts and projections is the disruption of traditional patterns of nurture in European villages. The process began long ago with the gradual expansion of commercial farming and the spread of new crops and methods of cultivation. More recently, two world wars, 1914–1918 and 1939–1945, disrupted rural and urban routines of life throughout Europe. Then after 1950, improved roads and electricity, together with radio, TV, and computers, brought familiarity with urban lifestyles to all, or almost all, European villages.

The effect on village communities was drastic. Innumerable children coming of age were no longer content to follow their parents' ways of life. Emigration to towns and cities seemed more attractive, and the countryside began to empty. In flat and fertile landscapes modern machinery allowed relatively few large-scale operators to raise crops that once had required hand labor. In poor hill villages fields were often abandoned and drastic—even total—depopulation ensued.

Simultaneously, the spread of new methods of birth control allowed sexual intercourse and childbirth to be dissociated more or less at will. The age-old pattern of early marriage followed by the speedy birth of a plurality of children swiftly disappeared. Consequently the rural reservoir of surplus children soon ceased to exist, and European cities began to attract migrants from across linguistic and cultural borders—often Muslims—to perform the low-paying jobs formerly filled by rural recruits from their immediate hinterlands.

A similar phenomenon exists in the United States, Canada, and other lands of European settlement overseas, even though rural villages scarcely existed in those lands, and by the eighteenth century individual farm families were already closely dependent on urban markets. All the same, in twenty-first-century United States, non-Hispanic whites no longer reproduce themselves at their former rates, even though immigrants bringing rural habits with them

Ferdinand Georg Waldmüller (1793–1865), *Children Making Their Grandmother a Present on Her Name Day*. With life's uncertainties, especially in infancy and old age, a plurality of children ensured sufficient family help.

from Latin America and other lands seem likely to sustain continued population growth for the nation as a whole as far ahead as 2050. The U.S. Census Bureau projects a growth of 50 million between 2000 and 2050, when the total will be 429 million (Demeny and McNichol 2006, 282).

Whether the world as a whole will eventually exhibit the pattern of demographic decay that prevails among Europeans today remains uncertain. But there are strong reasons to suppose that the recent worldwide reduction in birth rates will continue and perhaps gain velocity in the near future.

Falling Birthrates Worldwide

What explains falling birthrates worldwide is the fact that soon after the year 2000, for the first time in history, a majority of humankind ceased to live on the land and began to depend on food someone else had raised. Money incomes and a worldwide market in

foodstuffs made this possible, together with modes of transport and storage operating on a scale unimaginable before railroads and steamships began to use fossil fuels to carry all sorts of goods longer distances and far more cheaply than before.

Medical and sanitary advances after 1850 improved urban health markedly, and after 1950 it even looked as though urban “die-off” might be effectually counteracted by sanitary engineering and antibiotics. But cities, reshaped by wholesale application of modern forms of mechanical energy, were simultaneously becoming far more inimical to child rearing than before.

Changing—and Disappearing—Role Models

Before water power, steam power, and electrical power transformed what we still call manufacturing (Latin for “making by hand”), most urban artisans lived and worked at home, where many of the characteristics of village forms of nurture prevailed. That is to say children and adults intermingled closely on a daily basis, so children could watch their parents at work from infancy and learn most of the relevant skills simply by imitating their elders. In medieval cities guilds of artisans commonly lived close together so neighbors reinforced traditional patterns of nurture, just as happened in villages. Continuities were further confirmed by formal apprenticeship, whereby an established craftsman took young boys into his household for a period of years and taught them what they needed to know to become master craftsmen themselves.

But shopkeepers, transport workers, and a great variety of other more marginal occupations provided far less adequate nurture for the young. Even when manufacturing was still done by hand, therefore, cities were socially unstable by comparison with villages. In particular, poor and unmarried marginal drifters, often fresh from the countryside, constituted a significant proportion of urban populations, though they seldom show up in surviving records.

In the Islamic lands, similar forms of nurture existed among urban artisans. Urban China too was

The first half of our lives is ruined by our parents, and the second half by our children. • **Clarence Darrow** (1857–1938)

similarly structured. But sub-Saharan Africa and pre-Columbian American societies may have been different. Reliable statistics, even for Europe, are scant to non-existent.

All such long-standing urban patterns of nurture started to change whenever work moved from homes to factories and offices where children were not permitted to accompany their parents. To be sure, some early factories employed children, especially young girls, to tend spinning and weaving machines. But infants and toddlers were never welcome. Commonly mothers stayed home, keeping house and carrying almost the whole burden of nurturing small children.

As new kinds of factory machinery took over manufacturing, it took a good deal longer for urban children to start contributing to family income than before. Formal schooling became necessary to qualify for more and more jobs. So during the nineteenth century most European countries inaugurated compulsory public schooling. Insofar as such laws were enforced, more and more children went to school for an ever lengthening number of years. School teachers began to rival and sometimes conflicted with what parents had to teach the young. Formal schooling therefore both increased the cost of child-rearing and decreased parental influence.

But radical disruption of urban patterns of nurture waited until the twentieth century. Several factors came into play. After about 1920, new household conveniences—washing machines, vacuum cleaners, and innumerable others—made housekeeping a part-time occupation. Electric refrigerators, frozen and packaged food, and all the wonders of contemporary supermarkets magnified the effect after 1950. Women responded by taking paid jobs to increase family income, and when necessary, hired others to look after their children. Parental nurturing diminished, and distinctive forms of youth culture, often rejecting both school and parental norms, became far more powerful than before.

Rebellious Youth

New forms of communication propagated these rebellious forms of youth culture far and wide. Radio

and gramophone in the 1920s, TV and portable recordings in the 1950s, and computers and the Internet in the 1980s brought the American version of youth culture to world attention. Young persons everywhere—or almost everywhere—could sample and yearn for instant gratification, often entangled with drug-induced exaltation as exhibited by star performers of almost their own age.

These were teachers of a different stripe from those in school and at home. Beginning in the 1960s many young people embraced them as well as a variety of contradictory forms of rebellion—hippies seeking to live close to nature, religious fundamentalists aspiring to stricter sexual morals, and environmentalists foretelling imminent disaster if we do not change our ways at once. What all these movements had in common was rejection of older ways of life. But parental rules were what youths in practice were able to repudiate.

This was not difficult to bring about. Effective birth control pills became widely accessible during the 1960s. Simultaneously, in all the richer countries, governmental social security payments became available to old folk, and, as schooling became more prolonged, raising children cost more than ever. Not surprisingly, then, many young parents reconsidered giving birth to as many children as their predecessors had done. In response, urban birth rates plummeted in Europe and North America. Rural and urban birth rates fell drastically in Japan and China as well, though in China state policy seeking to enforce the limit of one child per couple played a far more intrusive role than elsewhere.

Accurate statistics for what is happening in cities of India, Southeast Asia, Africa, Latin America, and the Muslim lands are unavailable. Probably, long-standing religious and family customs prevail for the most part, and village life still embraces most of the population. These are the regions where population growth continues so vigorously, despite millions of emigrants departing for Europe and America. Yet falling birthrates everywhere—even in Africa—suggest that old patterns of family and community life are already weakening.

If these lands replicate the disruption of nurture that took place in Europe and North America in the

past fifty years, the world as a whole may well begin to see declining populations after 2050. Other factors are sure to come into play. Energy and other ecological shortages, epidemic disease, warfare, or the breakdown of long-distance economic exchanges may provoke sudden depopulation. On the other hand, new inventions—technological, social, and political—may make raising children easier and more rewarding.

But until a viable urban substitute for traditional village communities can be found, the biological and cultural continuity of humankind will remain at risk. Without more effective forms of nurture than prevail among us today, especially in cities but also increasingly in villages, our species is unlikely to survive very long into the future.

Childhood

Historians struggle to define the roles children have played in history, mostly because the documentation that exists focuses on Western offspring of elites and is seen through an adult perspective. Although childhood is shaped largely by local influence, some modern global forces put new pressures on children; a fundamental redefinition of childhood has been under way since the late nineteenth century, affecting how children can define their roles and how adults perceive them.

All societies focus heavily on children and childhood. Considering childhood on a global scale and in a global history context offers opportunities to distinguish between inherent, or natural, features of childhood and those imposed by particular economic, political, and cultural structures. It also challenges historians to think about the relationship between global forces and the phase of life in which individual personhood is determined.

At the same time, however, there are important limitations. The history of childhood is difficult to study because of the nature of sources. Adults speak about children far more than children speak for themselves, which distorts our view of childhood in the past. It is far easier, furthermore, to deal with childhood for elites than for ordinary people historically, for relevant sources are far more abundant. Nevertheless, some important ventures have already been made into the history of childhood, and there is growing interest in the topic among current historical researchers.

More is available, however, on childhood in Western history than on childhood in most other societies,

which at least for the moment affects opportunities for study, including comparative opportunities. Childhood is also closely shaped by local and regional factors—particular religions, laws, and so on. It has not been easy to see more global forces shaping childhood, at least before the nineteenth and twentieth centuries. There are few comments on the history of childhood in the pages of world history texts, a situation that may well change as further research occurs, opening new possibilities for a world history perspective on a vital topic. Happily, however, work on childhood in several other societies, such as China, is advancing rapidly.

Recognizing Childhood

Within Western history, fierce debates have raged over how much conceptions of childhood have changed over time, particularly in terms of children's position within the family. The classic work by Philippe Ariès, *Centuries of Childhood*, which really launched the study of the history of childhood, argued that premodern Western society had relatively little concept of childhood, viewing children as small adults and, as a result, often treating them harshly. Lloyd de Mause, a psychohistorian, picked up this claim when he argued that only in the twentieth century did children begin to be treated properly (a sweeping condemnation of the past that few would now defend). Other historians have claimed to find relatively little grief evinced when children died in the premodern West, partly because high birth rates cushioned any individual loss. From the eighteenth century onward, according to this classical school, childhood began to

Charles Dickens's *Oliver Twist* called attention to the plight of poor children in industrialized Europe. In this drawing, young Oliver pleads for mercy before a magistrate.

be more sharply differentiated as a separate stage of life, and bathed in greater sentimentality.

In contrast to this approach, a revisionist group, comprising mainly medievalists and early modernists, points to a clear recognition of childhood in earlier centuries, including distinct categories of legal treatment, along with high emotional investment by parents in individual children. It is clear, for example, that most families did grieve when children died, often viewing these events as decisive in family history—though this does not mean that the grieving process was the same as the modern emotional reaction. Debate continues, with some middle ground between the position that there has been no essential change in the conception of childhood and the position that there are massive modern/premodern contrasts; the more moderate position is probably the most accurate. Similar debates may apply to differences among societies, to the question of how many aspects of childhood are natural, and so uniform across the major societies in world history, and

how many significant variations must be identified and explained.

Children in Agricultural Societies

Much of world history is taken up with the development of agricultural societies and civilizations. We know several things about children in agricultural societies, and about comparative issues, even when further specific analyses remain desirable. First, most children in agricultural societies were put to work at a young age, and indeed the economic utility of children was vital to family calculations in any agricultural society. This remains true in agricultural societies today. One of the reasons birthrates rose when agriculture replaced hunting and gathering was because of a need for labor. This does not mean that children were worked excessively hard, but that they were expected to help, and job training constituted a major part of the socialization of both boys and girls. Only an upper-class segment, as well as a few children identified as particularly talented from the lower orders, might be spared from work in order to spend significant time in school.

Second, because families in agricultural societies were fairly large, with an average birthrate of five to seven children per family, children had considerable interaction with siblings, and older siblings, particularly girls, were expected to help care for their younger brothers and sisters. As death rates between infancy and two years of age ranged from 30 to 50 percent of the total in agricultural societies, children in those societies also had extensive, intimate experiences of death.

There were also, however, a number of differences among various agricultural societies. Schooling is one; differences in schooling depended both on the dominant culture and on available resources. Islam encouraged efforts to provide some religious education, particularly in the cities, especially to boys but sometimes to girls. Hinduism, by contrast, fiercely limited access—at least to religious literacy—to the top three castes. Chinese Confucianism encouraged

Pieter Bruegel the Elder, *Children's Games* (1560). Oil on canvas. This painting documents adult/child interaction in popular games played by the Dutch peasantry during the sixteenth century.

lots of education for a minority, but showed little concern for a broader base. But Confucianism as adopted in Japan under the Tokugawa shogunate (1600/1603–1868) produced widespread schooling, reaching up to 25 to 30 percent of all boys. Within Christianity, Protestantism encouraged efforts to promote literacy, whereas Catholicism, more reliant on the intermediary of priests, was traditionally less active.

Approaches to discipline also varied. American Indians were appalled at the amount of physical punishment dished out by Protestant immigrants. Denominations of Christianity that emphasized original sin, which no child could escape, tended to be strict. Hinduism, by contrast, encouraged a greater delight in children and their promise. Family structures also varied in ways that could affect childhood. The European-style family, introduced from the later Middle Ages (fourteenth–fifteenth century),

emphasized relatively late marriage and nuclear, rather than extended, families; children had a closer, possibly tenser relationship with individual parents than was true in the extended families that were characteristic of eastern Europe and most of Asia. Because there were few adults around, Europeans often hung young infants on hooks in the house, so that they would not get into trouble while their mothers worked. In contrast Chinese and African mothers typically took their children with them to work in the fields, wrapping them on their backs and maintaining close physical contact. Emphasis on work in subordinate positions helps explain the common emphasis on obedience for children in agricultural societies, even in school settings.

In between commonalities and contrasts, agricultural societies varied (though more modestly) when it came to issues of gender in childhood. All the societies were patriarchal, emphasizing boys, particularly

older boys, over girls. But some societies stressed the importance of boys more than others, to the point that in some female infanticide was used to get rid of unwanted girls and limit the total burden of children on individual families. This was true for long periods of Chinese history and also in classical Greece. Islam, however, worked hard against the older Arab practice of female infanticide, on grounds that both boys and girls had souls. Chinese Confucianism stressed more systematic inculcation of girls' inferiority than did Indian culture; one manual (written by a woman) urged that girl babies be placed at the feet of beds, to emphasize their lower position, while boys be allowed to sleep at the side of parents. There was also some variation in arrangements for marriage of older children. All agricultural societies stressed the importance of property transmission and adult supervision in marriage. In India, China, and some parts of Africa, marriages were arranged while girls were very young, whereas in regions where Christianity and Islam dominated, mate selection for children usually took place at a somewhat later age.

Childhood in Industrializing Societies

The world history of childhood shifts gears considerably as agricultural civilizations begin to be challenged by a more commercial world economy. Comparison remains important, but some wider generalizations are also possible. Western Europe and the new United States pioneered some of the crucial departures from the norms of premodern childhood, and while other parts of the world did not follow slavishly, there were some general patterns emerging by the later nineteenth century.

A gradual redefinition of the purposes of childhood, away from work and toward schooling, was a key change. The greater emphasis on education emerged in Europe and the United States as a result of Enlightenment beliefs in the educability and progressive possibilities of children. This view dovetailed with the long-term results of industrialization

which, after producing some initial factory exploitation of children, reduced the number of jobs children could do while increasing the need for literacy and numeracy in the labor force. From the 1830s onward, labor laws explicitly limited children's work. Other societies jumped on the educational bandwagon with varying degrees of speed. Japan, where schooling was already well developed, pushed for universal education from 1872 onward. Eastern Europe moved in the same direction, and in the post-World War II years under Communism, which disputed other aspects of the Western model, mass education became a major goal. Everywhere the numbers of children in school and the length of time devoted to education increased. Intriguingly, while girls lagged behind boys in educational access in some places, most mass education movements included girls, if only because of the need to improve the education of mothers as part of the wider association of childhood and schooling.

In the West, this fundamental redefinition of childhood was accompanied by heightened attention, at least in principle, to the innocence of children and to their lovable qualities. Birth rates began to drop, which expanded the emotional as well as financial investment in individual children. With the decline of infant mortality, particularly dramatic between 1880 and 1920, there were growing efforts to shield children from death and new movements for the legal protection of children. The concept of adolescence expanded the reach of childhood and resulted in the minimum legal age for marriage going up, as well as in growing attempts to regulate adolescent sexuality. By no means did all of this export to other parts of the world, but in most cases industrialization resulted in lower birth rates, which had a similar impact in increasing the attention lavished on individual children; this was true in Japan, for example, and, by the later twentieth century, in China as well.

By the twentieth century, and particularly after World War II, several global currents added to these patterns of change, though great diversity remained. Children's work received international attention. From the 1920s onward international organizations, such as the International Labor Office, formulated

The world history of childhood shifted gears considerably as agricultural societies were challenged by the world economy. Commercially sponsored beauty pageants for young girls are common in twenty-first-century Chinese malls.

standards that would limit the burden of work, particularly on young children. But the pressures of the global economy, which led manufacturers to seek ever cheaper labor, actually expanded the incentive for the use of child workers in some regions. By the later twentieth century half of all child laborers were employed in South and Southeast Asia. Economic pressures also accounted for a growing sexual exploitation of older children with parents sometimes selling daughters to aid the family economy in societies such as Thailand or parts of Eastern Europe, where the sex trade has grown; some global tourism focused explicitly on sexual activities, and girls, rather than adult women, were sought because it was believed that they would be less likely to be infected with HIV. Some desperately poor families also exploited children for exportable body organs, while in Africa the growing phenomenon of child soldiers pointed to another disruptive pattern.

Against these trends, a global human rights movement with a focus on children gained increasing momentum. The Save the Children organization, which emerged in 1919 after World War I and the Russian Revolution, sought to help displaced children across Europe. Its mission evolved after World War II to a more general campaign to assist children materially and psychologically affected by war—leading, for example, to the 1996 United Nations Study of the Impact of Armed Conflict on Children. More general attempts to define children's rights internationally led to the 1989 United Nations Convention on the Rights of the Child, ratified within a decade by all but two countries, Somalia and the United States. The Convention enunciated rights in law and in educational access. In 1999 the International Labor Organization followed with Convention 182 against the most exploitative child labor, including sexual exploitation. These initiatives sometimes won

superficial commitments that led to little change, but some imaginative implementations have also ensued, such as a 1996 “foul ball” campaign that forced the Federation of International Football Associations to refuse to endorse soccer balls sewn by children, or a 2003 decision to stop the use of child riders in camel races in parts of Arabia.

Another global phenomenon affecting children involves new patterns of migration, emerging from the late nineteenth century onward and involving long-distance movement into societies with radically different cultures—for example, Asian migrations to the West, Caribbean migrations to the United States and Western Europe, or African and Middle Eastern migrations to Western Europe. Generational tensions and identity issues, part of any migration process, have been exacerbated.

Finally, the spread of global consumerism has obvious implications for children and childhood. Children often lead in picking up consumerist cues, welcoming them in part because of their role in reducing parental and other adult authority. Children in many societies have become prime consumers of global goods, whether rock music or fast food. Global symbols like Disney, blue jeans, or Coca-Cola provide some currency for a global youth culture quite different from the more traditional cultures of older generations. Interestingly, even as Western and international agencies express concern about the sexual exploitation of children, consumer cues often emphasize the sexuality of older children—another tension in the modern global mix, and one that inspires resistance from more traditional sectors eager to defend customary modesty.

These changes, accelerating in the first years of the twenty-first century, do add up to a tidy package. Some modern global forces put new pressures on

children, particularly in some of the world’s poorer regions. Despite diversities, something of a fundamental redefinition of childhood has been under way for more than a century, affecting how children can define their roles and how adults perceive them.

China

For millennia China has influenced (and been influenced by) the rest of world. Advances in science and technology put China ahead of the West for a few centuries after 1000 CE, but China's dynastic governance (and occasional warlordism) temporarily set the country back. But in the twenty-first century China has undergone a series of remarkable transitions; its government has successfully reasserted unity and expanded its global influence beyond earlier limits.

China's prominent role in world history corresponds to its size and its age. In the twenty-first century China is second only to Russia and Canada in territorial extent; some 1.33 billion people living within China's borders make the country by far the most populous land on Earth. *Homo erectus* populations existed in China about 900,000 years ago, and modern *Homo sapiens* arrived about 40,000 years ago. Agriculture dates back more than 10,000 years; state-building and civilization arose, initially in the Huang (Yellow) River valley, beginning about 4,300 years ago, and attained lasting and distinctive forms by the time of the Shang dynasty (1766–1045 BCE).

Chinese civilization first influenced neighboring peoples in eastern Asia—Koreans and Japanese farther east, steppe nomads to the north and west, and tropical gardeners to the south. China has always retained primacy in that part of the world thanks to the skills, the numbers, and the economic and political prowess of its population. As transport and communication improved over time, China's influence reached ever more widely across Asia, and the Chinese continually enriched themselves by importing new skills, new knowledge, and new things from afar. Beginning

about 100 BCE, with the opening of organized caravan trade along the so-called Silk Roads, this process of interaction began to affect western Asia and even distant Europe, creating an Old World web that eventually expanded around the globe after 1500, creating the tumultuous world we know today.

Early China to 221 BCE

Chinese texts preserve a uniquely comprehensive political narrative. It begins with mythical divine rulers and continues with accounts of a merely human dynasty, the Xia (2100?–1766? BCE). Scholars

Wooden irrigation flumes, along with canals and dams, aided rice cultivation.

hotly debate whether archaeological evidence unambiguously proves the existence of the Xia dynasty. But in the 1920s, excavation at Anyang, seat of the last rulers of the Shang dynasty, uncovered thousands of “oracle bones” inscribed in a script close enough to modern Chinese writing to be interpreted by experts. These and other remains show that basic elements of subsequent Chinese civilization had already taken shape by 1300 BCE.

Anyang is situated where the Huang River of northern China traverses a region of soft, windblown loess soils. That was where early farmers had begun to raise millet, later supplemented by wheat and barley, come from Mesopotamia. The Shang armies also used horses, chariots, and compound bows, introduced from the western steppe.

Far-reaching changes came under the Zhou dynasty (1045–256 BCE). First of all, rain-watered agriculture

that had been basic for the Shang was supplemented and soon overshadowed by extending cultivation to the fertile soils of the river flood plain. This required massive building of dikes and canals to control and direct the flow of water. When successful, this water engineering assured ample moisture for the harvest and diminished north China’s dependence on uncertain summer rains. It also vastly expanded the area of cultivation generations of conscripts labored to extend dikes and canals up and down the river valleys and across the coastal plain of north China.

Drainage canals permitted early Chinese cultivators to irrigate their new fields and made it possible for them to raise rice. Rice grew naturally in shallow water along the lakeshores and river banks of southeastern Asia, where local gardeners began to harvest it as early as 8000 BCE. But artificial dikes and canals, like those constructed in the Huang Valley, artificially extended the area of suitably shallow water enormously. Millet and other older crops persisted, but by about 200 BCE rice had become an important staple for China’s rapidly growing population, as it remains to this day.

When river flood plains began to fill up with cultivated fields, the Chinese took on a far more strenuous task of leveling slopes, building dikes around small artificially leveled fields, called paddies, and channeling even very small streams to bring water to them. This allowed hillsides in what eventually became central and southern China to produce rice almost as abundantly as the naturally flat river flood plains did.

As this enormous engineering effort gradually expanded across the landscape—a process that took millennia, and may not have reached its final limits in the Himalayan foothills even today—China’s population began to assume the close-packed density and imposing numbers that still characterize the country. Human muscles, assisted by shovels and wheelbarrows (a Chinese invention), did almost all the work. It remains the most extensive, drastic, and successful remodeling of a natural landscape ever undertaken by humankind.

Impact of Rice Cultivation

Similar rice paddies eventually appeared in Korea, Japan, the Philippines, Java, and Sumatra, in all the great river valleys in Southeast Asia, and as far away as the Ganges in India. Wherever wet rice cultivation spread, dense rural populations arose and supported royal or imperial governments. Something like half of humankind came to depend on this sort of agriculture and still does. But because China's two great rivers, the Yangzi (Chang) and the Huang, drained such extensive watersheds, the country remained by far the largest and most populous among all the rice-growing lands.

Rice, like other grains, must be harvested and stored when ripe to feed everyone throughout the year and provide seed for next year's crop. Governments and a sizable class of landowners arose when it became feasible for them to collect stores of grain from the harvest in payment for taxes and rents; once-independent cultivators were thus turned into rent- and tax-paying peasants. Rice-growing peasants had more to spare than other grain growers since a single rice seed ordinarily produced several stalks carrying more than a hundred seeds in all, compared with a seed-to-harvest ratio of only about 6 to 1 for wheat in medieval Europe. That did not mean that Chinese peasants were rich. Instead, taxes and rents rose high enough to allow the transfer of extra food to city folk—rulers, landlords, artisans, and casual laborers. So from the time rice became basic for China, cities grew to be larger than was possible in rain-watered lands elsewhere.

Despite its unrivalled productivity, irrigated rice cultivation had serious costs. Standing water in paddy fields made malaria and a debilitating parasitic disease called schistosomiasis very common; for a long time the Yangzi Valley—today the most fertile and populous region of China—remained notoriously unhealthy and was less densely populated than the north.

In the north, man-made dikes confined the Huang, and the river's channel clogged with silt picked up as it flowed through soft loess soils. Like the Mississippi today, that silt soon raised the lower course of the

river above the level of the land outside the dikes. Efforts to forestall floods by building higher dikes could stave off disaster for a while, but sooner or later the river broke through and resulting floods became far greater and more damaging than before. The Huang thus earned the nickname "China's sorrow." No other river carries so much silt, and the Huang is correspondingly unstable. In historic times unusually high floods on several occasions have shifted its lower channel by several hundreds of miles.

Increasing Rule of Landowners

Enterprising local landowners initiated (and conscripted field workers to build) the large-scale water-engineering works that reshaped China. As newly irrigated fields came into existence, the income and authority of landowners grew; as local rulers they soon were strong enough to pay little or no attention to the distant emperors. From the start they quarreled among themselves. Centuries of upheaval ensued while agricultural production increased, as did the ills created by intensifying warfare among local rulers.

Confucian and other schools of thought competed in words as vigorously as rival armies did, defining much of what became classical rules of behavior for later generations. But ideas in and of themselves had little to do with the ultimate restoration of public order. Rather, when the Zhou dynasty died out in 256 BCE, the pretense of imperial unity was abandoned, and the contemporaneous Warring States period came to a climax in 221 BCE when a single warlord from the state of Qin on the northwest borderland subdued all rivals. His dynasty did not long survive. Instead, after another bout of warfare, China attained a more lasting imperial and cultural unity under the Han dynasty (202 BCE–221 CE).

Imperial China (202 BCE to 1911/12)

The Han dynasty became a model for other dynasties in later Chinese history. The advantages of imperial government uniting the fertile river valleys

As early as the Han dynasty, China established tribute systems in which the emperor presented gifts to nomad chieftains in exchange for obedience and loyalty.

of north and south China with shifting control over borderlands was so great, that whenever a dynasty collapsed, a new emperor and dynasty soon emerged after relatively brief civil wars. As the central government expanded over the centuries—and China's borders stretched to absorb territory occupied by diverse populations speaking different languages—officials recognized the need to create a system that facilitated communication.

Written symbols, however, can be used to record and communicate languages as different from Chinese as Japanese and Korean, just as the numerals 1, 2, and 3, pronounced differently when spoken in English, French, and German, are mutually understandable as visual representations. Eventually the characters of classical Chinese literature, as edited, elaborated and preserved by Confucian scholars—and then propagated by formal education among

untold millions of Chinese across two thousands years—provided a set of ideas and precepts that both restrained and guided rulers and also taught obedience to the emperor and his officials just as long as divine favor—the Mandate of Heaven—kept him on the throne. The Han dynasty was the first to patronize Confucian scholars, and the emperors spent much time performing ancestral rituals designed to maintain good relations with heaven and lesser spirits, as Confucius (551–479 BCE) had prescribed. Even when Buddhism won a large following at court and in the country at large, subsequent dynasties continued these rituals to be safe from supernatural harm.

The Temple of Heaven in Beijing, built in the fifteenth century. Emperors were both guided and restrained by the Mandate of Heaven, the divine sanction of just and wise rule. Photo by Joan Lebold Cohen.

The Confucian style of commitment to imperial unity was in turn sustained by the way bulky goods, which were paid as taxes in kind, could arrive at the imperial capital after traveling in barges along canals initially constructed for drainage and irrigation. At first the Yangzi Valley remained isolated from the Huang River network of canals, so resources from the south could not easily reach the imperial court in the north. But in 611 CE the Grand Canal opened, connecting these two principal river systems. Nothing close to such a capacious, cheap, and safe transport system existed elsewhere. The Chinese government and people prospered as a result, spreading rice paddies and building cities throughout the hills and valleys of the Yangzi watershed, more than doubling China's size and resources by the time the lengthy pioneering effort neared completion.

Massive expansion southward in turn allowed the government to cope, not quite so successfully, with the problem of safeguarding itself and its subjects. Enlarged tax income made it easy to elaborate rituals for propitiating heaven and other powerful spirits. Keeping steppe nomads at a distance and preventing their destructive raids was more difficult. Horses thrived on the grassy steppes; and nomad tribesmen spent much of their lives in the saddle, guarding their herds against outsiders and, when opportunity offered, stealing horses from one another, or invading Chinese borderlands to seize grain or anything else they found useful.

The Great Wall and Its Impact

Men mounted on horses moved far faster than infantry could ever hope to do. But horsemen could not easily overcome the obstacle of fortified city walls; thus the famous Great Wall of China was constructed across centuries in the hope of stopping steppe raiders. Infantry equipped with crossbows (a Chinese invention) could indeed repel steppe attacks from on top of the Wall as long as enough bowmen were already in place to meet them. But hundreds of miles of Wall and open country between its gaps needed more men on guard than even the Chinese Empire

The Great Wall, constructed over centuries to prevent raids from steppe nomads, has become an iconic symbol of China. Photo by Tom Christenson.

and its canal transport system could support day after day year round.

Two alternatives existed: hiring some nomads to stop their fellows from attacking by paying them with what they might otherwise have seized; or training and supplying enough Chinese cavalymen to meet and defeat steppe raiders. Both methods were tried over and over, without solving the problem lastingly. Hired nomads could change sides at any moment; but keeping horses in China was horribly expensive. In the absence of a supply of natural grass, a horse ate many times as much grain as a man needed, so matching steppe horsemen with enough Chinese cavalymen was very costly. More nearly successful was to establish peaceful relations with nomad chieftains, by giving them goods they desired as gifts in return for ritual recognition of obedience to the Chinese emperor. But such treaties, too, often broke down and raids began anew.

Nonetheless, over centuries the effect of raiding and gifting between China and the peoples of the

steppe was to familiarize nomads with more and more aspects of Chinese civilization, eventually spreading key Chinese inventions far and wide throughout Eurasia. Chinese armies and armed expeditions also extended Chinese influence westward from time to time, beginning in 101 BCE, when the Han emperor Wudi sent an expedition to the Ferghana Valley, in modern Uzbekistan, to bring back a breed of “blood-sweating” horses capable of carrying heavily armored men on their backs. For centuries thereafter caravans connected China with western Asia along what Westerners called the Silk Roads. As a result, communication within the Eurasian web attained a new velocity and regularity that increased little by little and reached a climax under Chinggis (Genghis) Khan (1126–1227) and his successors.

To begin with, China had much to learn from Indians and other peoples of western Asia. Buddhist holy men began to filter into China even before the Han dynasty collapsed; and during the years of civil strife and divided sovereignties that ensued, the new religion won many adherents, including Shi Huangdi, the emperor who founded the Sui dynasty and reunited China in 589. Buddhists retained imperial favor until 843 when Confucians succeeded in disbanding their monasteries and prohibiting their religion. But the Confucians had to borrow much from the Buddhists in order to refute them; so restored Confucianism came to resemble the other high religions of Eurasia more closely than before. Buddhist sects continued to exist in secret, especially among the poor and the oppressed, and often sparked rebellions when a dynasty began to weaken.

Buddhist art also affected older Chinese styles profoundly. The landscapes and portraiture of classical Chinese painting owed much to their Buddhist predecessors. More important for Chinese society as a whole was the fact that Buddhist monasteries introduced many Chinese to the advantages of buying and selling goods of daily consumption. In ancient China money played only a limited role for rural populations. Taxes, rents, and services were usually paid in kind, and peasants lived on what goods remained. Buddhist monks however, coming from India along the

Paper money originated in China in the twelfth century, but use in the West was not widespread until a shortage of coinage in the 1600s.

Silk Roads, were accustomed to selling the produce of landed estates pious believers deeded to them and then used the proceeds to buy whatever the monastery needed. Before their dissolution in 843, each monastery in China therefore became the center of a local market; Chinese townsmen and peasants far and wide soon expanded the use of money by buying from and selling to one another as Buddhist monks had done.

Cash and Carry

Use of money eventually became widespread enough that under the Song dynasty (960–1279) the imperial government found it convenient to collect taxes in money rather than in kind. Before a century had passed more than half the government’s income took the form of (first) metal and then paper currency. Consequently, millions of ordinary peasants started to sell part of

their harvest to pay taxes. Some even specialized, for example, by raising silkworms, and started to buy their food just like townspeople. Thereupon, goods of common consumption—rice, salt, iron, silk, and innumerable others—began to circulate along the waterways of China. Even a small difference of price made it worthwhile for merchants to carry goods to distant markets along the rivers and canals; and all the advantages of specialized production, which the eighteenth-century Scottish economist Adam Smith later analyzed so convincingly, came into operation among something like 100 million Chinese. China began to grow in population, wealth, and skill more rapidly than ever before, while the government fanned the whole process by spending its cash income on whatever it needed.

Simultaneously, agriculture intensified when a new species of early-ripening rice reached China from the south after 1000. Wherever water was available all summer long, this meant that Chinese farmers could raise two crops a year, thereby doubling production per acre. Needless to say, the effect was enormous. Work intensified, population increased and became denser than ever, since throughout the well-watered plains families could survive on half as much land as before. The social discipline of unending work to keep fields, dikes, and canals in order made the Chinese work force far more diligent and productive than most others.

This superiority began to show under the Song, when important new industries appeared, not least the manufacture of guns and gunpowder. Newly perfected porcelain began to rival silk among China's exports; and when the discovery of how to make coke out of coal solved a long-standing fuel shortage in northern China, large-scale iron works multiplied. Fragmentary tax records show that iron production almost quadrupled from 32,500 tons a year in 998 to 125,000 tons in 1078, but that pace was not long sustained, and by 1260 production had dropped to a mere 8,000 tons per year.

Guns and Gunpowder

Chinese officials shaped by the Confucian tradition distrusted captains of industry almost as much as

they distrusted soldiers. Officials feared that such persons, left to themselves, might become rich and powerful enough to threaten public authority. So the fact that officials closely supervised weapons manufacture from the start, and then monopolized the sale of iron agricultural implements in 1083, may have changed prices and made iron production unprofitable. What happened is uncertain, but we do know that most imperial tax income went to supporting armies along the steppe frontier, and as their steppe neighbors became more formidable, the Song government began systematically to reward the inventors of new and more efficient weapons. Gunpowder weapons accordingly came quickly to the fore.

The government needed all the help it could get, for in 1127 the Song were driven from northern China by a new tribal steppe confederation. Nonetheless, strenuous investment in naval vessels, defended by new technologies in guns and catapults, as well as by crossbows, allowed the dynasty to survive as the Southern Song (1127–1279), ruling from Hangzhou, a new capital to the south of the Yangzi River. Then another steppe confederacy under Chinggis Khan conquered north China in 1227; his grandson Khubilai (Kublai) Khan commissioned Chinese artisans to build a navy of his own and would later use it to overrun south China, thus founding the Yuan dynasty (1279–1368).

Mongol Empire

The massive commercialization of Song-dynasty China and accompanying improvements in weaponry soon spread far and wide within Eurasia. Steppe peoples were the first to feel the impact, as the rapid development of their military formidability demonstrated. Indeed, the Mongol Empire at its height extended across all of Asia to the shores of the Mediterranean and northward into Russia. No land empire since has equaled its extent. For two or three generations after the 1240s, thousands of soldiers, merchants, captives, and caravan attendants moved continually back and forth across the steppe.

The mingling of peoples provoked by the Mongol conquests was extraordinary. We know that when

a papal emissary, William of Rubruck, reached the Mongol capital at Karakorum in 1253 he met the wife of a goldsmith who had been born in Flanders a few miles from his own birthplace; and the Muslim traveler Ibn Battuta tells how he met a merchant from his native Morocco in south China about a century later. A Venetian gem merchant, Marco Polo (1254–1324), spent seventeen years in China. His memoirs, which were dictated while he was a prisoner of war in Genoa at the end of his life, became a sensation in Europe. Innumerable such encounters spread detailed knowledge far and wide about superior Chinese skills. It is striking to realize that the three inventions the English philosopher Francis Bacon (1561–1626) later declared to have made Europe modern—the compass, gunpowder, and printing (together with its essential partner, paper making)—all reached Europe from China by word of mouth, and without leaving any written record. Motifs of Chinese painting also traveled throughout the Muslim world, eventually so misunderstood that stylized drawings of the massive Yangzi gorges became perches for peacocks.

Borrowing from afar always involves transformation and adjustment to a new environment. That had been true of Chinese borrowing from India and western Asia in earlier times as they developed their own Buddhist sects and forms of mounted warfare. European, Indian, and western Asian responses to gunpowder, printing, and the compass were just as varied, but the new Chinese techniques affected warfare, shipping, and communication everywhere, even though Muslims at first rejected printing.

Han Chinese were never fully reconciled to Mongol rule under the Yuan dynasty, and when the Huang River broke through its dikes and devastated much of northern China before finding a new path to the sea, they knew that the Mandate of Heaven had been withdrawn from their foreign rulers. Plague also ravaged China in the 1330s, and the government mismanaged the paper currency by indulging in reckless inflation. Not surprisingly, public order broke down until, after years of fighting, a new (and non-foreign) dynasty, the Ming (1368–1644), united the country once more. As Mongol power collapsed,

caravan linkages across Asia diminished without breaking off entirely.

The Chinese began to explore alternative sea routes as soon as defenses along the northwest frontier seemed sufficiently secure, allowing the third Ming emperor, Zhu Di (known as the Yongle emperor, reigned 1402–1424), to embark on an ambitious program of overseas exploration and expansion into the Indian Ocean. Altogether, six armadas, dispatched between 1405 and 1433, carried hundreds of ships and thousands of men to the shores of the Indian Ocean, touching on the coast of east Africa and even penetrating the Red Sea. Wherever the ships appeared the Chinese admiral, Zheng He, collected rarities as gifts and demanded that local rulers recognize the sovereignty of the Chinese emperor. The scale of these expeditions dwarfed the four ships with which Vasco da Gama started his voyage to India in 1497, but unlike the Portuguese discovery of the sea route to India, Zheng He's voyages had no enduring effect. Although his naval expeditions won friends for the Ming, they did not bring in enough revenue to cover their costs. Recognizing that the voyages were unsustainable, the Confucian bureaucracy banned all maritime travel. The imperial navy was allowed to rot away, and the Ming focused on defending their land borders.

Overseas Trade Declines

Private overseas trade from Chinese ports dwindled as long as sailing remained illegal, but a Chinese diaspora had already begun to develop throughout Southeast Asia and continued to thrive until very recent times. So the Chinese never withdrew entirely from the seas. What might have been if they had anticipated Europeans by crossing the Earth's oceans and discovered both America and Europe sometime before 1450, as they were certainly capable of doing, beggars the imagination. This is perhaps the most dramatic turning point in world history—an abdication whose long-term consequences still reverberate.

Nevertheless, from their own point of view, China's rulers were wise in concentrating public effort on safeguarding their landward frontier while closely

He who cannot agree with his enemies is controlled by them. • **Chinese Proverb**

regulating trade with European and other foreign merchants who began to visit their ports after 1520, when the first Portuguese ship showed up. For little by little the Chinese began to prevail against the steppe horsemen.

Three circumstances go far to explain this seismic shift in China's relation with the steppe peoples. First, beginning in the time of the Mongol Empire, bubonic plague spread across Eurasia killing up to a third of the population on its initial onslaught. Probably the plague bacillus had emerged from one of its long standing homes in the Himalayan foothills when Mongol horsemen raided northern Burma (now Myanmar) in 1252–1253, and then carried it back to their homeland, where a new array of burrowing rodents—the normal carriers of the infection—offered the bacillus a new set of hosts.

Within a few decades the disease became endemic across the entire Eurasian steppe, infecting burrowing rodents of several different species; and after the initial catastrophic attacks on human populations in China, western Asia, and Europe between the 1330s and 1349, lesser outbreaks of plague recurred from time to time in all the agricultural lands of Eurasia. We have no written record of what happened among steppe dwellers, but it seems certain that their exposure was greater than among farmers since, wherever they pitched their tents, the reservoir of infection among burrowing rodents of the grasslands lay immediately beneath their feet. Nomad populations shrank substantially as a result and nomad strength in war diminished accordingly.

Second, with the development of more-efficient handguns after about 1550, and with better supply systems, Chinese (and Russian) armies further weakened the nomads. The Ming dynasty began to expand its power into the steppe, organizing mobile armies of foot soldiers, equipped more often with crossbows than with handguns, and supplied by wagons trained to form defensive circles in the face of nomad attack. These tactics proved very effective and soon allowed Chinese settlers to begin to move into the grasslands wherever moisture was sufficient to sustain crops.

Nonetheless, between 1644 and 1683 China suffered a second conquest from the steppes when Manchu cavalymen, taking advantage of quarrels among rival Chinese generals, seized Beijing and proclaimed a new dynasty, the Qing (1644–1911/12). The Manchus were already familiar with Chinese ways and were correspondingly more acceptable to their Chinese subjects than the Mongols had been. Their cavalry, supplemented by Chinese infantry, made a formidable force and allowed the Chinese to expand their power westward until they encountered the equally expansive Russian Empire. Thereupon, two treaties—signed in 1689 and in 1727—defined boundaries between them. The last steppe confederacy to resist the Chinese met defeat in 1755; and Tibet was subdued between 1755 and 1779, bringing China's imperial boundaries to limits that still prevail.

East/West Exchange

This expansion westward was also sustained by a massive growth in China's population. Here it was crops introduced from the Americas—potatoes, sweet potatoes, and peanuts—that made the most difference. Sweet potatoes, in particular, tolerated poor soils and could grow on higher slopes and other marginal locations where rice did not thrive. They therefore became very significant in south China, while ordinary potatoes played the same role on a somewhat smaller scale in the north.

Communication with Europe expanded and became far more precise after 1601 when a Jesuit mission was admitted to the Ming court. Surprisingly, the Chinese made the Jesuits responsible for correcting their calendar to fit the seasons properly. The emperor and his ministers believed that rituals assuring the harvest could only work when offered at the right time of year; and nothing mattered more than that. Later they also asked the Jesuits to cast cannon for their armies and to supervise a ground survey and then make a map of the entire empire.

Jesuit missionaries continued active at the Chinese court until 1706, and year after year reported

Chinese soldiers, killed by Anglo-French forces in one of the key battles of the Second Opium War, lie at Fort Taku, Tianjin.

everything they did to Rome. They made only a handful of converts, but nevertheless found much to admire in Chinese society, and European readers of their detailed reports often did so, too. In particular, the long-standing Chinese practice of recruiting government officials by written and oral examinations seemed very rational to learned Europeans, and several German states imitated the Chinese example early in the eighteenth century. A little later, Chinese decorative art, as transmitted by porcelain and embroideries, became suddenly fashionable as well. And radical eighteenth-century French writers, like Voltaire, thought the Chinese example of a country without priests or revealed religion was far superior to European superstition. In short, the two civilizations were exchanging ideas among experts as never before and on a scale that began to affect them both in far-reaching ways.

Overall, therefore, the Chinese government and economy prospered at home and abroad until the closing decades of the eighteenth century, when population pressure on the land began to provoke rebellions, and when frictions over foreign trade intensified. The British were unhappy that China restricted their trade to the port of Guangzhou (Canton) and only allowed them access to selected merchants who demanded silver currency for Chinese

goods like tea, silk, and porcelain. The Chinese rebuffed a British effort to negotiate a trade treaty in 1793 when Lord Macartney, whose primary mission had been to establish European-style diplomatic relations with China, refused to prostrate himself before the emperor as court ritual required. In the early 1820s, despite official efforts to prohibit it, trade in opium imported by the English East India Company created addicts in Guangzhou and adjacent regions. When the East India Company monopoly on English–China trade was abolished in the 1830s, tensions over opium continued to mount, leading to the First Opium War (1839–1842). The war intensified when the British navy showed up on the Chinese coast in 1841–1842, proceeded to bombard coastal ports into submission, and even interrupted traffic on the Grand Canal. A series of “unequal” treaties ending this Opium War (and one that followed in 1856–1860) transferred Hong Kong to British control, opened Chinese ports to European traders, established a uniform 5 percent tariff, and gave Europeans the protection of consular and mixed courts for settling disputes among themselves and with the Chinese.

Such humiliation was impossible for the Chinese people to accept, while European admiration for things Chinese turned into something like disdain

for their helplessness. At the bottom of Chinese society, desperate but ill-considered efforts to adopt European secrets of power began to spread among angry young men, as the Taiping Rebellion (1850–1864) showed. It was instigated, and for a while led, by a man who, after repeatedly failing the imperial examinations, met an American Baptist missionary from Tennessee and subsequently claimed to be the younger brother of Jesus Christ, sent by God to bring heaven to Earth and rid China of its corrupt Manchu rulers.

For a few years the Taipings met with widespread success, overthrowing the imperial administration in south China and almost capturing Beijing. But Britain and France sent armed forces to safeguard their treaty rights, and after occupying Beijing and sacking the emperor's summer palace in 1860, they joined forces with the local Chinese militias that defeated the Taiping rebels by 1864. By then, between 20 and 30 million Chinese had died, and much of the country had been laid waste. The dynasty barely

survived, harassed by increasing diplomatic and military pressure not just from Britain and France but also from Russia, a newly-united Germany, and most acutely from neighboring Japan. In 1900, the so-called Boxer Rebellion, provoked this time by an underground Buddhist sect, tried to drive the foreigners away, only to meet defeat. Desperate efforts at self-strengthening ensued, but starting to build a European-style army merely created a disloyal officer corps that joined rebellious students to overthrow the dynasty in December 1911; the Qing emperor agreed to abdicate in February 1912.

Post-Imperial China

Three figures dominated the tumultuous political scene in China after the fall of the Qing: Sun Yat-sen (1866–1925); Chiang Kai-shek (1887–1975); and Mao Zedong (1893–1976). Sun Yat-sen was trained abroad as a medical doctor, but turned into a revolutionary conspirator before becoming the first

Children in Communist China respond with emotion to an unseen speaker.

president of the Republic of China (1912–1949). As head of the Chinese Nationalist Party (Guomindang) he aimed to reshape Chinese society, but local warlords operating in many different provinces resisted his leadership; by the end of his life the Guomindang found itself sharing power with a rival Communist party, modeled in part on the Russian example.

Chiang Kai-shek, trained as a soldier in Japan and Russia, became head of a new military academy organized by the Guomindang before succeeding Sun Yat-sen. He quarreled with the Communists in 1927 and compelled them to withdraw from the area around Guangzhou in southeastern China; Mao Zedong had already begun to recruit an army of guerrillas among impoverished peasants in neighboring Jiangxi province. After their fabled retreat from Jiangxi in 1934–1935 (called the Long March), the Communists found refuge in the northwest at Yan'an; with Mao firmly in control, they launched plans for a rural revolution.

Chiang then set out to defeat competing warlords and was able to occupy Beijing before the Japanese army invaded Manchuria in 1931 and China proper in 1937. Chiang's armies eventually had to retreat up the Yangzi all the way to Chongqing, while Japan set

up a puppet Manchu emperor over the rest of China. Nonetheless the United States and Britain recognized Chiang's government throughout World War II and made Chiang's China (Republic of China) a founding member of the United Nations Security Council.

But Japan's defeat in 1945 reopened the struggle between Chinese Communists and the Guomindang. Despite American efforts to support Chiang, Mao's forces prevailed, setting up a new People's Republic of China in October 1949. Chiang and a remnant of his army withdrew to the island of Taiwan where their successors still remain in power.

The rebellions, wars, and general disorder before and after the end of the Qing dynasty closely resembled previous dynastic transitions. Many historians believe Mao's government behaved very like a new dynasty, even though succession depended upon a small circle at the top of the Chinese Communist Party rather than upon a small circle of Confucian officials serving a new emperor.

Internationally, Mao's victory at first seemed to strengthen the Communist cause enormously, and for a while U.S. politicians were much agitated by the "loss of China." Yet in fact Russian and Chinese Communists were rivals as much as allies from the start, and 1968–1969 border disputes even led to brief armed collision between the two governments. President Nixon took advantage of this rift in 1972 to travel to China in the hope of reestablishing diplomatic relations, thus recognizing its growing economic and political power. Liaison offices opened in Beijing and Washington D.C. in 1973, and formal diplomatic relations were inaugurated on 1 January 1979.

Since then China has gone from strength to strength. Mao's successors, notably Deng Xiaoping, relaxed efforts to collectivize China's farmland in 1981, allowing peasants to produce what they chose and to sell their surpluses at will. Parallel private competition with state-run factories soon provoked urban and industrial expansion on a quite extraordinary scale—as much as 12 percent annual growth in gross national product. Chinese-manufactured goods soon became cheaper and often better than

A portrait of Mao Zedong hangs prominently on a government building. More than three decades after his death Mao's image remains an icon of Chinese Communist rule.

anything available elsewhere. Exports swelled accordingly and other countries, with the United States in the lead, went deeply in debt by importing all sorts of consumer goods from China. In 2008 China played host to the Olympic Games, a crowning glory for a government that has never ceased to face foreign criticism for its suppression of human rights in Tibet and elsewhere.

Yet all is not well in the new China. Ecological pollution is widespread and acute. Population presses heavily on resources, and official efforts to diminish the birthrate by prohibiting couples from having more than one child strains traditional family life, despite the relaxation of the one-child policy in 2009. The vast Three Gorges Dam on the Yangzi may disrupt age-old methods of irrigation. Still other disasters may suddenly loom. Political discontent simmers in Tibet and perhaps elsewhere; but so far, at least, the Communist government has been successful in reasserting political unity, increasing wealth for many,

and expanding China's worldwide influence beyond all earlier limits.

Chinese Traditional Religion

Chinese traditional religion borrows elements from Daoism, Buddhism, and Confucianism, blending them into a system of beliefs centering upon the gods and spirits who are said to rule the physical world. The pantheon of the popular religion includes the spirits of the deceased and has a hierarchy similar to that of an empire.

The customary beliefs and practices of Chinese popular religion have constituted an integral part of Chinese civilization throughout the course of its five-thousand-year history. Even today, popular religion remains a vital force in many Chinese ethnic communities, thriving particularly in Taiwan, Hong Kong, and Southeast Asia, where it has never been actively suppressed by the political authorities. In general, the ideas and customs associated with this form of religious expression represent a syncretic popularization of the more literary and institutionalized traditions of Confucianism, Daoism, and Buddhism. Existing in relative harmony with these more established systems of belief, popular religion in China has evolved and flourished much more freely than similar folk traditions in the West, where the established religions, such as Christianity and Islam, are exclusivist and have historically suppressed heterodox religious movements.

The belief in the existence of gods and spirits (*shen*) that have power over the affairs of this world constitutes the essential feature of the differing forms of popular religion in China. These spirits are variously conceived of as the deceased members of one's family or community, as deified figures from history or literature, or as the spiritualized embodiments of natural and geographical forces. The most common

form of religious practice involves the maintenance of private shrines and community temples, where the prayers and supplications of the believer are frequently accompanied by ritual offerings of food or the ceremonial burning of incense. Various forms of shamanism and divination are practiced in an effort to attain a more sympathetic union between the human and the divine and thereby discern or influence the course of one's personal or community destiny. In short, the values and aspirations that have sustained popular religion throughout the ages are those related to the survival and preservation of the family and community, along with the desire to maintain the delicate harmony and reciprocity conceived to exist between the human and spiritual realms.

Household Rituals

Ancestor worship is one of the most common rituals associated with Chinese popular religion. Dating back to the ceremonial practices of China's ancient kings, it has evolved to constitute a popular expression of the deeply rooted Confucian ethic of filial piety. Traditional Chinese households maintained a domestic altar where ancestral tablets of stone, wood, or paper were inscribed with the names of the deceased to serve as the focus of offerings made to their spirits. Today, photographs often take the place of the more traditional tablets, but the desire for blessings, along with the family's obligation to ensure its deceased members a comfortable existence in the next world, remain the primary motivation of such practices. Those that died with no descendants to maintain their ancestral rites, or who perished

Traditional Chinese households maintained a domestic altar for making offerings to deceased ancestors.

under particularly violent or evil circumstances, were of great concern to the community in traditional times. These “hungry ghosts,” as they were known in popular legend, could resort to frightening forms of spiritual mischief if they were not properly propitiated. Many communities therefore established shrines specifically devoted to the ritual commemoration of these orphan spirits.

Another common expression of popular religion at the household level was the worship of the stove god (Zao Jun). Also dating back to very ancient times, this practice represents one of the most enduring cults associated with the Chinese folk tradition and shares many similarities to the worship of fire or kitchen gods in other traditional societies. As the benevolent preserver of the family hearth, the stove god was believed to oversee the moral conduct and ritual propriety of the family unit and to issue a yearly report on such matters to Heaven around the time of the traditional lunar new year. In this respect, the stove god was conceived of as a sort of policeman in a hierarchy of divine officials that ruled the spiritual realm just as the earthly authorities governed the affairs of this world. Worship of the stove god thus reflected the pervasive belief in Chinese popular religion that the spiritual world was organized in a bureaucratic fashion that paralleled

the centralized imperial administration of China’s dynastic rulers.

Public Rituals

Many other activities associated with Chinese popular religion served as civic ritual intended to preserve social harmony, reinforce local identity, or ensure the good favor of the gods and spirits in meeting the various challenges of community survival. One particularly prevalent cult associated with this sort of community ritual was the worship of the local earth god (Tudi Gong). A small shrine for this deity was maintained in virtually every neighborhood or rural locality in China, bolstering the sense of regional solidarity so characteristic of traditional society. The earth god was believed to protect the community from the potentially evil influences of wandering ghosts or malevolent spirits (*gui*), along with overseeing and reporting the activities of those inhabiting his precinct to higher deities. Thus, like the stove god, the earth god was seen as another component of the spiritual hierarchy that constituted what one modern scholar has described as the “imperial metaphor” of popular religion.

The city god (Cheng Huang) was next highest in the rank of divine officials accorded the task of supervising the spiritual affairs of the local community. Enshrined in a temple near the center of his jurisdiction, the city god was normally depicted in the traditional robes of a Confucian scholar-official. Indeed, the various city gods were frequently associated with a deceased notable honored in local history for his righteousness and efficacy as an official of the imperial government. The city god was even believed to be in command of soldiers that could be used to enforce his divine edicts and preserve the moral integrity of the community. These soldiers were themselves the recipients of ritual offerings by the local residents, who occasionally placed small portions of simple food on the thresholds of their homes to reward them for their service and to assuage their ferocity. On key holidays or anniversaries, it was customary to physically convey the statue of the

Making sacrifices at ancestral gravesites to honor deceased relatives was a basic part of religious ritual beginning in the Zhou dynasty (1045–256 BCE).

city god on an inspection tour of the region under his command. These ritual processions were often accompanied by great celebration and fanfare as the local residents reconfirmed their sense of community by organizing various festivities.

The Supreme Deity and the Influence of Daoism

The origin and essential nature of the Chinese belief in a supreme deity remains one of the most obscure and debated topics in the study of Chinese philosophy and religion. From the investigation of Shang dynasty (1766–1045 BCE) oracle bone inscriptions dating back to the second millennium BCE, it is clear that the Chinese considered Shangdi (“Ruler on High”) to be the supreme god of the spiritual realm. Because of its awesome and overwhelming powers, this deity could not be supplicated directly, and the divinatory practices of the Shang kings normally consisted of calling upon the spirits of deceased royal ancestors to intercede with Shangdi on their behalf. In the centuries that followed, this supreme deity became increasingly referred to as Tian (“Heaven”) and was regarded somewhat more abstractly, and in a less personified manner, than in earlier times. During the Zhou dynasty (1045–256 BCE), the

Chinese ruler became formally regarded as the Son of Heaven (Tianzi), a development that permanently linked the imperial institution with the chief deity of the spirit world. Thus, throughout most of Chinese history, the ruler was regarded as the primary intermediary between Heaven and Earth, and only he was permitted to worship or implore Heaven directly.

From the time of the Northern Song dynasty (960–1126 CE), the supreme deity of the Chinese has been popularly conceived of as the Jade Emperor (Yu Huang Shangdi), the supreme ruler of the heavens and the underworld and the protector of mankind. According to Daoist legend, the Song emperor Zhen Zong (968–1022; reigned 997–1022) experienced a visitation from the Jade Emperor in a dream, afterwards proclaiming himself the deity’s incarnate descendant. This official acknowledgement of the Jade Emperor placed the god at the pinnacle of the Chinese pantheon and formally sanctioned the popular conception of an elaborate bureaucratic order in the spiritual world that paralleled the imperial institutions of the world below. In Chinese popular religion, the Jade Emperor reigned supreme over all the Daoist, Buddhist, and other popular deities of traditional lore in addition to commanding the various spiritual forces of the natural world. Approached primarily through intermediaries, the

At the New Year, calligraphy hanging on homes in South China honors kitchen gods and other auspicious guardians who will keep the evil spirits away from the door. Photo by Joan Lebold Cohen.

Jade Emperor was often implored by the common people for good harvests and protection against natural calamities. He was also turned to for the remission of sins, in the hope that his pardon, as the ruler of the underworld, would secure a more favorable afterlife. This popularized conception of the supreme deity was, therefore, less abstract and more accessible to the masses than the Tian associated with classical Confucianism.

Many of the deities associated with Chinese popular religion, including the Jade Emperor, are derived from the various sects of folk (or religious) Daoism that emerged during and following the Han dynasty (206 BCE–220 CE). Differing significantly from the philosophical Daoism of the earlier classical tradition, folk Daoism placed great emphasis upon mastering the sublime forces of the natural and spiritual worlds with the ultimate goal of attaining everlasting felicity and physical immortality. Daoist immortals (*xian*) therefore became the primary subjects of religious

reverence, and their individual stories provided the legendary basis for an elaborate pantheon of divine beings. These Daoist “saints,” who collectively symbolized happiness and prosperity, included allegedly historical figures from a variety of social and occupational backgrounds, both male and female. The members of an especially noteworthy group, the Eight Immortals, were often venerated as the patron deities of various professions in a fashion quite similar to the veneration of patron saints in Western Catholicism. Daoist deities also included spiritual beings associated with the forces of nature or the agricultural cycle, such as the Lei Gong (the god of thunder), Yu Shen (the god of rain), and Feng Shen (the wind god). Daoist priests trained in the esoteric traditions of their sect were often called upon in times of drought or other natural calamities to perform rituals of exorcism to rid a region of malevolent spirits or to conduct magical ceremonies to restore harmony to the natural forces.

When joss sticks (incense) are burned as offerings, the aroma reaches gods and ancestors for their pleasure in the afterlife. Photo by Joan Lebold Cohen.

Buddhist Influences

Folk Buddhism was another source of many of the deities and ideas incorporated into Chinese popular religion. The most popular among these are drawn from the Mahayana Buddhist belief in bodhisattvas, supremely compassionate beings that have postponed their attainment of nirvana for the sake of assisting all others in the quest for spiritual salvation. The female bodhisattva Guanyin (called the goddess of mercy) was by far the most widely worshipped of these spiritual beings. Often supplicated in times of personal loss or tragedy, Guanyin was regarded as a benevolent savior for the masses, who in her infinite compassion would never fail to rescue or console her sincere devotees. Statues of Guanyin could be found in many Buddhist shrines and

temples throughout China, and households frequently maintained her image on their domestic altar. The spiritual comfort of turning toward the loving goddess Guanyin has many parallels to the deep devotion directed toward the Virgin Mary in Western Catholicism.

Folk Buddhism also influenced popular beliefs pertaining to life after death. One of the most essential features of popular religion in China is belief in a divine system of rewards and punishments, in which departed individuals are judged according to their merits in this life and sent either to a blissful abode in heaven or a tormenting corner in hell. These visions of heaven and hell, along with other notions regarding ghosts and the afterlife, have served for centuries as one of the most creative subjects in Chinese art and storytelling. In short, popular religion in China has

A supplicant puts fake paper money into a burning vat, believing that the “cash” will be delivered to ancestors who will have use for it in the afterlife.
Photo by Joan Lebold Cohen.

assimilated many of the concepts and deities central to both the Buddhist and Daoist traditions, informally combining and transforming them in a manner that has stimulated and inspired the popular imagination throughout Chinese history.

Tradition of Syncretism

The enduring appeal of popular religion among many ethnic Chinese communities around the world testifies to its lasting importance as a conveyor of China's accumulated cultural traditions. By incorporating, in syncretic fashion, key elements

of the country's diverse religious and philosophical traditions, it has consistently served to bring a measure of cultural harmony to potentially conflicting systems of belief. Popular religion in China thus illustrates the inherent tolerance and flexibility of Chinese civilization at the level of folk culture. Thus, while sharing some notable similarities with the veneration of saints and other aspects of popular religion in the West, Chinese popular religion has enjoyed a freer course of evolutionary development and has, therefore, more readily assimilated and preserved the diverse influences that have contributed to Chinese civilization throughout its long history.

Chinggis Khan

(c. 1162–1227)

MONGOL CONQUEROR

Chinggis Khan (popularly known in the West as Genghis Khan) was a tribal leader in the late twelfth and early thirteenth centuries. He first united Mongolia, then conquered northern China and much of Central Asia. The Mongol Empire eventually stretched from the Pacific Ocean to the Adriatic Sea.

Chinggis (Genghis) Khan was born with the name of Temujin. Although Chinggis Khan has a negative image in the West, he is one of history's most charismatic and dynamic leaders. After surviving tribal wars in Mongolia, Temujin built a tribal confederation that restructured Mongolia and established an empire that encompassed more territory than that of any other conqueror. His successors continued to expand it, making it the largest contiguous empire in history.

Born to the noble family of Yesugei and Ho'elun of the Borjigin Mongols, Chinggis Khan was betrothed as a child to Borte of the Onggirat, another Mongol tribe. Yesugei was assassinated on his way home from leaving Temujin with Borte's family, after which Temujin returned to his own family. Temujin endured many additional hardships in his youth, including tribal warfare and the kidnapping of his wife Borte, but slowly he recruited supporters and assumed a mantle of leadership among the Mongols.

After rising to power in 1185, Temujin experienced several setbacks, but eventually he emerged victorious. A key to his success was an alliance with Toghril Ong-Khan, ruler of the Keraites, a powerful tribal confederation. With Toghril's support, Temujin regained Borte and became a major power in Mongolia. Eventually, relations between Temujin and Toghril soured, but

Temujin was victorious in the ensuing war between them. By 1206 Temujin was the paramount power in

"The Inauguration of Chinggis Khan." This and the other historical illustrations in this article come from *Ghengis Khan*, by Jacob Abbott. New York: Harper & Brothers Publishers (1902).

Mongolia and received the title Chinggis (or, traditionally in English, Genghis) Khan (thought to mean Oceanic, or Firm, Resolute Ruler).

After uniting the various tribes of Mongolia into a single nation, Chinggis Khan went on to conquer much of northern China and Central Asia. His wars were as often occasioned by his desire for retaliation for perceived wrongs as for territory or riches. In 1207 the Mongols began operations against the kingdom of Xi Xia, which comprised much of northwestern China and parts of Tibet. This campaign lasted until 1210, when the Xi Xia ruler submitted to Chinggis Khan.

Chinggis Khan did not rest long. In 1211 he led his armies against the Jin dynasty, which ruled northern China. War continued against the Jin until 1234, well after Chinggis Khan's death. Meanwhile, in 1219, during the war in China, a caravan under the protection of Chinggis Khan was massacred in Otrar, a city of the empire of Khwarizm, which consisted of much of modern Uzbekistan, Turkmenistan, Iran, Afghanistan, and Tajikistan.

With his armies engaged in China, Chinggis Khan attempted to find a peaceful solution, but the ruler of Khwarizm forced the issue by refusing to turn over the governor of Otrar. Chinggis Khan left a trusted general, Muqali, to battle the Jin and led an army into Central Asia. The war lasted from 1219 to 1222, and the Mongols destroyed Khwarizm. Striking from several directions, Chinggis Khan's armies carried out a campaign that is still considered strategically remarkable even today. Yet despite having conquered Khwarizm, Chinggis Khan kept only the territories north of the Amu Dar'ya River so as not to overextend his armies.

In 1226 his armies invaded Xi Xia once again to quell an uprising there. During the campaign, Chinggis Khan fell from his horse and later died from internal injuries suffered in the fall. His followers completed the reconquest of Xi Xia and then buried Chinggis Khan in a secret location that remains a mystery, although several modern expeditions have attempted to find it.

Map showing the kingdom of Chinggis Khan. His strategic and organizational genius created one of the most highly disciplined and effective armies in history.

“Merchants Offering their Goods.” The Mongol Empire secured trade routes and encouraged merchants from all regions to travel and do business within the empire.

In the scope of world history, Chinggis Khan's achievements are many. An organizational and strategic genius, he not only created one of the most highly disciplined and effective armies in history, he also gave birth to the core administration that ruled his empire. His nonmilitary achievements included the introduction of a writing system to the Mongols, the promotion of religious tolerance throughout the empire, and unity among the Mongols. Furthermore, Chinggis Khan fostered transcontinental trade. The empire secured trade routes and encouraged merchants from all regions to travel and do business within the empire. Because of this, new goods, technologies, and ideas spread across Eurasia. But Chinggis Khan's most enduring accomplishment is the presence in the twenty-first century of a Mongol nation and culture. Mongols today still venerate him as the founding father of Mongolia.

Christian Orthodoxy

Although it has no central authority, the doctrine of Orthodox Christianity is based on holy tradition, especially the tradition established by the seven ecumenical councils that were held during the fourth through eighth centuries CE. The Eastern Orthodox Church initiated its separation from the Roman Catholic Church of the West in the ninth century, and its theology differs from that of the Western denominations.

The Orthodox Church is a communion of independent Eastern churches organized geographically, usually by country. Together they constitute the second-largest Christian denomination after the Roman Catholic Church. Orthodoxy sees itself as the one holy, catholic, and apostolic Church founded by Jesus Christ.

Eastern and Oriental Orthodox Churches

Most Orthodox churches belong to the Eastern Orthodox family of churches, with a smaller number belonging to the Oriental Orthodox family. In Eastern Orthodoxy, the churches are classified as either autocephalous (completely self-governing) or autonomous (mostly self-governing, but dependent upon a mother church). First among the autocephalous churches are the four ancient patriarchates that remain Orthodox; they are, in order of seniority, the churches of Constantinople, Alexandria, Antioch, and Jerusalem. These are joined by the eleven autocephalous churches of Russia, Serbia, Romania, Bulgaria, Georgia, Cyprus, Greece, Poland, Albania, the Czech Republic, and Slovakia, and the Orthodox Church in

America. The autonomous churches are those of the Sinai, Finland, Japan, China, and Ukraine.

The Oriental Orthodox churches are those that may be traced to disputes over the Third and Fourth Ecumenical Councils. The Assyrian Church of the East, sometimes erroneously referred to as “Nestorian,” is generally regarded as having not recognized the Third Council. Those churches generally regarded as having rejected the Fourth Council are the Armenian, Coptic (Egyptian), and Ethiopian churches, and the Syrian churches of Antioch and India.

Theological Authority

While Western Christians dispute whether the proper sources of theological authority are the Bible alone or the Bible together with the tradition of the church, Orthodox Christianity understands there to be one source, holy tradition. This tradition is rooted first of all in the Bible, and then in the seven ecumenical councils (including what is commonly called the Nicene-Constantinopolitan Creed, or Symbol of Faith, completed in 381 CE), and in later councils, the writings of the church fathers, the liturgy, the canons of ecumenical and local councils, and the holy icons.

When it comes to the formulation of church dogma, however, the Eastern Orthodox churches accept the validity of the first seven ecumenical councils. These meetings of bishops in the first eight centuries of the church’s history, all convened to settle theological disputes within the Church, are considered the most authoritative expressions of Christian doctrine. The First Council of Nicaea (325 CE) affirmed the humanity and divinity of Christ and composed the first two-

A page from Miroslav's Gospel (c. 1180) an illuminated manuscript resulting from the fusion of Western (Italian) and Eastern (Byzantine) elements. The text is now housed at the National Museum of Serbia in Belgrade.

thirds of the Nicene-Constantinopolitan Creed. The First Council of Constantinople (381 CE) affirmed the divinity of the Holy Spirit and added the final third of the Creed. The Council of Ephesus (431 CE) affirmed the unity of Christ and declared his mother, the Virgin Mary, to be Theotokos ("birthgiver of God"). The Council of Chalcedon (451 CE) defined the human and divine natures of Christ, as opposed to the "one nature" doctrine of the Monophysites. The Second Council of Constantinople (553 CE) continued the work of Chalcedon. The Third Council of Constantinople (680–681 CE) condemned the Monothelite ("one-will") heresy, affirming that Christ has two wills (divine and human). The Second Council of Nicaea (787 CE) condemned the iconoclasts ("icon breakers") and upheld the proper veneration of icons.

The Great Schism

The break between East and West, between the Eastern Orthodox Church and the Roman Catholic Church, is often dated to 1054 CE, but the history is more complex. The Great Schism was the result of an estrangement between the East and the West that developed over several centuries due to differences in culture, politics, and language, as well as theology. The chief theological controversies that exacerbated the estrangement and led ultimately to a break in communion had to do with the authority of the Roman pope and a change in the Nicene-Constantinopolitan Creed. Both issues led to the so-called Photian Schism of the ninth century and to the mutual excommunications that occurred in 1054.

The five centers of the church in the first millennium CE, the so-called Pentarchy, were Rome, Constantinople, Alexandria, Antioch, and Jerusalem. Rome, as the first capital of the empire and as the traditional location of the death of two Apostles, Peter and Paul, was honored by being accorded primacy. In the East, the proximity of the patriarchal sees to one another functioned like a system of checks and balances, allowing the East to maintain the polity of autocephalous churches in communion with one another. But Rome was alone in the West, and over time the office of the pope began asserting more and more authority, even to the point of claiming jurisdiction over the Eastern churches. The proclamation of papal infallibility in the nineteenth century added a further obstacle to reunification.

The Nicene-Constantinopolitan Creed declares that the Holy Spirit "proceeds from the Father." Beginning in Spain in the sixth century, however, some Western Christians began adding a word (*Filioque*) to the Latin translation of the Creed that results in the declaration that the Spirit proceeds "from the Father *and the Son*." Despite efforts to add this word to the creed at Rome, it was not officially added to the text until 1054 CE. The *Filioque* issue is really twofold. On the one hand, there is a possible dogmatic dispute. If by *Filioque* the West means that the existence of the Holy Spirit has two sources (the

Clergymen of the Eastern Orthodox Church. From *Costumes of All Nations: 123 Plates, Containing over 1500 Coloured Costume Pictures by the First Munich Artists*. London: Grevel and Co., 1913.

Father and the Son), then the East sees the resulting subordination of the Spirit to the Son as heresy. If the West means something else, however, such as the position of St. Maximos the Confessor (580–662 CE) that the Spirit proceeds from the Father and through (*dia*) the Son, then a resolution of the theological difference is possible. On the other hand, the East clearly believes that no one autocephalous church has the authority to change the Creed, which was the product of two ecumenical councils. So even if there is a dogmatic resolution, the Orthodox position would still require the elimination of *Filioque* from the Creed.

A Liturgical Theology

The etymology of the term *Orthodox* is twofold, having the meaning of either “right belief,” “right glory,” or both. This is suggestive of Orthodoxy’s fundamental assumption that worship is the primary

theological transaction. Thus it is the Church’s worship, especially its eucharistic liturgy, that is the locus of theology, and not the classroom or the library. The theologian is not the academic but the one “who prays truly,” in the words of Evagrius of Pontus (c. 346–399 CE). Orthodox theology is therefore best understood as doxological in character.

The Orthodox Church celebrates at least seven mysteries or sacraments: baptism, chrismation (confirmation), Eucharist, repentance (confession), marriage, anointing of the sick (unction), and ordination. The principal forms for celebrating the Eucharist are the Divine Liturgy of St. John Chrysostom (used most of the year), the Divine Liturgy of St. Basil (used ten times annually), the Liturgy of the Presanctified Gifts (used on weekdays during Lent and the first part of Holy Week), and the Divine Liturgy of St. James (traditionally used on the feast of St. James of Jerusalem, but there is a growing use of this liturgy on other days during the year). While refraining from speculation as to the metaphysics of eucharistic presence, Orthodoxy believes strongly in the real presence of Christ’s body and blood.

The Church year begins 1 September and includes the pre-Nativity fast (Advent); Nativity (Christmas); Theophany (Epiphany); Great Lent; Pascha (Easter); Pentecost; and the additional fasts preceding the feast of the Apostles Peter and Paul (29 June) and the Dormition (Assumption) of the Theotokos (15 August). The Twelve Great Feasts of the Church are the Nativity of the Theotokos (8 September); the Exaltation of the Cross (14 September); the Nativity of Christ (25 December); Theophany (6 January); the Meeting of Our Lord (2 February); the Annunciation (25 March); the Entry of Our Lord into Jerusalem (Palm Sunday); the Ascension; the Day of Pentecost; the Transfiguration (6 August); and the Dormition (Assumption) of the Theotokos (15 August). Most Orthodox churches reckon these dates according to the Julian calendar, although since the beginning of the early twentieth century, a number have adopted the secular Gregorian calendar for fixed dates. The Paschal cycle of movable feasts is still reckoned according to the Julian calendar.

*Vstriecha krestnago khoda
na prazdnik Vsiekh Sviatykh*
(Procession for the Feast of
All Saints) 1945.

In addition to the mysteries, the Church observes the canonical hours of prayer: vespers, compline, the midnight office, matins, the third hour, the sixth hour, and the ninth hour. As in the West, these are rarely celebrated fully outside of monasteries. However, most parishes celebrate Saturday night vespers and/or Sunday morning matins.

Theological Positions

In addition to differences from Western Christianity as to the sources of theological authority, the theology of the Orthodox East is characterized by numerous theological positions, also known as theological distinctives, that greatly affect its understanding of God, humankind, and the economy of salvation. Because Orthodoxy did not undergo Roman Catholic scholasticism or the Protestant Reformation that resulted, the East has avoided many of the theological polarities associated with the internecine struggles of the West.

Mystical Theology

For the Christian East, theology—dogmatic, moral, or otherwise—must be lived. “Mystical theology” is

the term that identifies the inextricable relationship between dogma and life, between the teaching of the Church and one’s personal experience. In the Orthodox view, theology that is not experienced is useless, and mysticism without theology is mere subjectivity. It is noteworthy that the East has given only three of its saints the title of “theologian”—St. John the Evangelist in the first century, St. Gregory of Nazianzus (329–389 CE), and St. Symeon the New Theologian (c. 949–1022 CE).

Apophatic Theology

The Orthodox tradition distinguishes between apophatic (negative) theology, and kataphatic (positive) theology. While each has a role within the Orthodox theological tradition, the apophatic is clearly preeminent. Following the lead of (Pseudo) Denys the Areopagite (fifth or sixth century CE), the East emphasizes the radical inability of human thought and language to describe God and “utterly excludes all abstract and purely intellectual theology which would adapt the mysteries of the wisdom of God to human ways of thought” (Lossky 2002). The theological ascent to God must be apophatic. Kataphatic theology, on the other hand, is a kind

Greek Orthodox churches, like this one in Warsaw in the early twentieth century, share distinctive elements of architecture, especially onion-shaped domes topped by crosses. New York Public Library.

of descent in which God manifests himself within the created order.

The Trinity

At the heart of all Orthodox worship, theology, spirituality, and life is the Holy Trinity—the Father, the Son, and the Holy Spirit. It is commonplace to say that Eastern theology begins with the three Persons and goes on to affirm the one Being, while Western

theology generally begins with the one Being and then proceeds to a consideration of the three Persons. The value of this generalization is limited, but it is accurate to say that the East has emphasized the three Persons of the Trinity more radically than the West. Perhaps the most famous Orthodox icon of all is the Old Testament Trinity painted by the Russian iconographer St. Andrei Rublev, c. 1410. It is a depiction of the three angels who appeared to Abraham in Genesis 18, an appearance understood by the East to be a Theophany (“manifestation”) of the Trinity.

Original Sin

Western Christianity’s understanding of many subjects, not least of them the question of Adam’s sin in the Garden of Eden, has been greatly shaped by the thinking of St. Augustine of Hippo (354–430 CE). Unfortunately, Augustine’s view of original sin was predicated on St. Jerome’s Latin (mis-) translation of Romans 5:12, which Jerome misunderstood to say that all humans bear the guilt of Adam’s sin, and not merely the consequence of that sin, which is death. To avoid association with Augustine’s view, Orthodox Christians generally prefer to refer to Adam’s sin as “ancestral sin.” Christian Orthodoxy also rejects the Calvinist notion that humankind is utterly depraved as a result of the Fall and the resulting denial of human freedom.

The Atonement

Western Christians since the eleventh century have largely understood the reconciliation between God and humankind in terms associated with St. Anselm of Canterbury (1033–1109). His “satisfaction theory” of the Atonement seems to portray God as requiring satisfaction for the sins of humankind, with Christ undergoing the required vengeance. In contrast, the Orthodox or “classical” theory sees the Cross as the victory of Christ over the forces of evil. More than that, however, the Christian East understands the salvific work of Christ as considerably wider and more far ranging than the Crucifixion alone. Humankind

was separated from God by our nature, by sin, and by death; Christ overcame these obstacles through his Incarnation (by which he assumed and therefore healed human nature), his Crucifixion (by which he overcame sin), and his Resurrection (by which he destroyed death and made all of humankind immortal).

Soteriology

Orthodoxy has been largely untouched by the Western disputes concerning justification and sanctification, instead understanding salvation as a matter of *theosis*, or deification. Tracing the idea from biblical texts such as 2 Peter 1.4, the Gospel of John, and the epistles of St. Paul, through the texts of patristic witnesses such as St. Irenaeus of Lyons (c. 120–203 CE), St. Athanasius of Alexandria (298–373), and St. Gregory Palamas (1296–1359), the Orthodox understand salvation as our becoming by grace what God is by nature.

Grace versus Free Will

A great part of the Reformation debate with Roman Catholicism centered on the relative roles of grace and free will in human salvation. Some Protestants, concerned to safeguard the efficacy of God's grace, went too far and denied human freedom. Orthodoxy overcomes this opposition with its understanding of synergy, the biblical idea (as in 1 Corinthians 3:9) that we are cooperators with God.

Moral Theology

Western moral theology, utilizing the insights of philosophical ethics, usually portrays the nature of morality as a function of nature (natural law), utility (various consequentialist theories), the character of the moral agent (virtue ethics), or simply as a matter of God's command or prohibition (voluntarism). While these elements play a role in the work of some Orthodox moral theologians, the patristic understanding characteristic of the tradition as a whole sees the moral life as a function of *theosis*.

Spiritual Theology

The classic text of Orthodox spirituality is *The Philokalia of the Neptic Fathers*, a five-volume Greek work edited by St. Nicodemus of the Holy Mountain (1748–1809) and St. Makarios of Corinth (1731–1805), published in 1782. The *Philokalia* (“love of the beautiful”) is a collection of writings on the life of prayer ranging from the fourth to the fourteenth centuries. It is associated with hesychastic (from the Greek *hesychia*, meaning “stillness”) spirituality and gives special attention to the Jesus Prayer (“Lord Jesus Christ, Son of God, have mercy on me”).

Science and Religion

Because Orthodoxy has emphasized a spiritual epistemology, or gnosiology, aimed at the deification of the creature rather than a totalizing narrative subjugated to biblical accounts, it has not been concerned with either the astronomical debates sparked by Galileo in the seventeenth century or the creation–evolution debate that began with the work of Charles Darwin in the nineteenth century but which was more characteristic of the twentieth century.

Churchill, Winston

(1874–1965)

BRITISH STATESMAN

Sir Winston Spencer Churchill, British politician and writer, is best known as his country's prime minister during World War II. In 1940, when Britain looked defeated, he defiantly rejected any deal with Nazi Germany. Determined to fight on, he inspired his people with oratory that called upon them to be heroes. At the time of supreme crisis, he promised nothing "but blood, toil, tears, and sweat."

Churchill's lifetime spanned a period that began when Britain's prestige was near its peak and ended when Britain had fallen to the level of a second-rank power and its empire had broken up. Churchill enjoyed a long, multifaceted, and sometimes controversial career. It started in the 1890s when he was a glory-seeking cavalry officer and journalist in India and concluded in the 1950s when as an old man he headed the British government in the first decade of the Cold War. In 1953 Queen Elizabeth II knighted him, and ten years later the U.S. president John F. Kennedy made him the first honorary American citizen.

Egocentric, energetic, and extravagant, Churchill often appeared larger than life. Although short in stature and unathletic in build, he seemed a giant. His image was that of a jaunty, confident, cigar-smoking, hard-drinking, bulldog-obstinate John Bull. Few people knew that he suffered from debilitating bouts of depression that he called his "black dog." Other than his wife Clementine, he had few close friends.

By birth, Churchill was an aristocrat, although without a personal fortune. Like most boys of his social class, he grew up spending more time with his beloved nanny than with his aloof parents. His

politician father, Lord Randolph Churchill, was a younger son of the Duke of Marlborough. His mother, born Jennie Jerome, was the glamorous daughter of a wealthy American. After doing poorly at Harrow school, the young Churchill attended the military academy at Sandhurst.

Churchill's time as an army officer was brief. He saw combat on the Indian frontier and in the Sudan, was a military observer in Cuba during conflict between Spanish troops and nationalist rebels, and during the South African (Boer) War was taken prisoner by the Boers and escaped. Except for a few months during World War I, when he commanded a battalion in France, he was a civilian the rest of his life, but a civilian who by holding political office commanded navies and armies.

In 1900 Churchill was elected to the House of Commons as a member of the Conservative Party. Objecting to Conservative proposals for protective tariffs, he soon switched to the Liberal Party, which defended free trade. The renegade Churchill was rewarded with increasingly important offices, beginning with the number two position in the ministry for colonies. He earned a reputation as a social reformer while president of the Board of Trade and home secretary. Shortly before the outbreak of World War I he became first lord of the admiralty. The failure in 1915 of a naval attack on Ottoman Turkey, followed by a disastrously unsuccessful land invasion at Gallipoli, led to Churchill's resignation. Demoted to the office of chancellor of the Duchy of Lancaster, he soon left the government altogether. Two years later he returned to high office as minister for munitions. Subsequently, he served his friend Prime Minister David Lloyd George as secretary of state for war and

It is a mistake to try to look too far ahead. The chain of destiny can only be grasped one link at a time. • **Winston Churchill (1874–1965)**

Prime Minister Winston Churchill of Great Britain (c. 1942). Library of Congress.

air and as colonial minister. Lloyd George's coalition government fell in 1922. By this time, the Liberal Party was divided and dying. Churchill made his way back to the Conservative Party. Prime Minister Stanley Baldwin was generous to the returning prodigal: Churchill served as chancellor of the exchequer from 1924 to 1929. This would be the last office he would hold for a decade. A multiparty national government dominated by the Conservatives, which came to power in 1931, kept Churchill on the back benches.

In the 1930s Churchill took positions that undermined his credibility. He led the fight against Baldwin's proposal to grant India a large degree of political self-government. Churchill was determined to preserve the integrity of the British Empire. When Edward VIII insisted on marrying Wallis Simpson, a divorced American woman, Baldwin and the leaders of the other political parties demanded that the

king abdicate. In contrast, Churchill wanted the king to keep his crown. Such eccentric policies isolated Churchill. He was regarded as impetuous and unreliable. This reputation made it difficult for Churchill to get a hearing when he warned about German rearmament and fiercely attacked appeasement of Adolf Hitler.

Nazi Germany's invasion of Poland in 1939 vindicated Churchill. He was reappointed first lord of the admiralty. When the war went badly, Prime Minister Neville Chamberlain resigned, and Churchill at age sixty-five replaced him. He assumed this office on the day that the German armies began their successful invasion of France and the Low Countries. After France sued for peace, Britain had no major allies until 1941, when Germany invaded the Soviet Union and Japan attacked United States possessions in the Pacific. Churchill took an active role in planning military campaigns. Remembering the enormous casualties of World War I, he favored a Mediterranean strategy and delayed a cross-Channel invasion of Nazi-occupied France. Despite his age and the discomfort of World War II aircraft, Churchill traveled frequently to confer with other political leaders. In addition to meetings with President Franklin Roosevelt in North America, he participated in other so-called summit conferences at Casablanca, Cairo, Teheran, and Yalta. Although fiercely anti-Communist, he developed a working relationship with the Soviet leader, Joseph Stalin.

Churchill's party lost the general election held in 1945. Although he was over seventy, his political career was not over. In 1946 he made his famous "iron curtain" speech at Fulton, Missouri, one of the defining moments that marked the beginning of the Cold War with the Soviet Union. During the 1940s Churchill favored some kind of limited economic and political unity for Western Europe. From 1951 to 1955 he again served as prime minister, retiring in his eighties.

Outside politics Churchill earned a reputation as a writer. Always in need of money, he wrote prolifically, mostly history and biography, often dictated to secretaries and researched by assistants. Some of

Winston Churchill, wearing a coronation robe, with his son and grandson in ceremonial dress. Photo by Toni Frissell. Library of Congress.

his books first appeared serialized in newspapers. His most important books include a biography of his father (1906); a history of World War I entitled *The World Crisis* (1923–1931); an autobiography up to the year 1904, entitled *My Early Life* (1930); a history of his ancestor, the first Duke of Marlborough (1933–1938); a collection of biographical essays, *Great Contemporaries* (1937); *The Second World War* (1948–1954); and his *History of the English-Speaking*

Peoples (1956–1958). In 1953 he was awarded the Nobel Prize for Literature.

Cinchona

Incas of the Andes were likely to have used the bark of the cinchona tree to combat fever, and Europeans later recognized it as a remedy for malaria, but many found it difficult to stomach and inconsistent in strength. After 1820, scientists' ability to isolate quinine, an antimalarial alkaloid, from its bark led to the cultivation of the tree in Java and India, until the advent of synthetic antimalarials after World War II.

Native to the eastern slopes of the Andes, the bark of the cinchona tree entered into the medical practice in Europe in the late sixteenth century as the cure for recurring fevers—that is, malaria. It is likely that the Incas had earlier used cinchona as a fever-reducing drug; the Spanish conquistadors are thought to have benefited from this indigenous practice when they introduced malaria from the Old World into the Americas during the course of their conquests. Popularized by the Jesuits, the use of cinchona bark increased in Western Europe over the course of the seventeenth and eighteenth centuries, eventually overcoming Protestant prejudice against the “Jesuits’ bark.” It gained a deserved reputation as a specific remedy for a particular set of physical complaints, long before the germ theory of disease.

Cinchona bark had its drawbacks, however. There were many different varieties of cinchona tree. The four principal alkaloids—that is, the organic bases containing nitrogen that had a physiological effect—varied greatly among the barks. Furthermore, the bark was difficult to stomach; Europeans generally took it mixed with wine.

From 1820, after the successful isolation of the cinchona alkaloids of quinine and cinchonine by French

chemists, demand increased for cinchona bark as the raw material for quinine, which became the most popular antimalarial medicine. Malaria was widespread in both the Old and the New Worlds, and new chemical manufacturing companies in North America and Western Europe sprang up to transform cinchona bark into the more easily digestible, alkaloidal forms of the antimalarial medicine. Andean specialists (*cascarillos*) harvested the bark; new roads were cut into the remote highlands of Bolivia, Ecuador, and Peru, and new towns were established to handle exports. The Andean harvesting methods, however, involved stripping off the bark, which killed the trees and ultimately put the future of the extractive industry at risk.

By the mid-nineteenth century, Europeans became increasingly concerned about the prospects for a continuing supply of cinchona bark from the Andean highlands. As Europeans embarked on their second great colonial expansion in the middle of the nineteenth century, the administrators of European empire laid plans to create a cinchona plantation industry within the Asian tropics. Thus began one of the great imperial European botanical ventures of the nineteenth century.

After Dutch failures in the 1850s to establish cinchona on Java in the South Pacific, in the early 1860s the British introduced cinchona to the Nilgiri Hills in southern India and to the highlands of Ceylon (Sri Lanka). These experiments were successful with two varieties known as *Cinchona succirubra* and *C. officinalis* that grew at different elevations. But these sizable efforts were then largely eclipsed by the dogged experimentation of the Dutch managers on Java, who procured seeds of another subvariety of cinchona known as *C. ledgeriana*. The Dutch experimenters

Illustration of *Cinchona calisaya* from a nineteenth-century book.

sampled the alkaloid contents of the barks of individual trees, and then destroyed all but the highest yielding. They also undertook an agronomic program of grafting high-yielding *C. ledgeriana* on to the hardier *C. succirubra* stocks. By the late nineteenth century, a large majority of the world's supply of cinchona bark was produced under the auspices of the Dutch on Java. The British cinchona plantations in India continued to produce bark for antimalarial medicines to be consumed within British India. Other European imperial powers—notably the French and the Germans—also set up cinchona plantations in Africa and in Southeast Asia, but these plantations produced relatively small amounts of bark, destined for the colonial tropical markets.

The demand for cinchona bark to make antimalarials was erratic. Malaria was a global health problem, but the antimalarials were expensive, and North

Americans and Western Europeans made up the lion's share of the market. Demand spiked during epidemic outbreaks and then receded. Plantation owners on Java often found themselves with an oversupply of cinchona bark, and when the price plummeted, some were forced out of business. The survivors of these market paroxysms entered into cartel agreements in a series of attempts to stabilize the global price of the bark.

During the 1920s, plantation owners and cinchona brokers formed an international cartel known as the Kina (the Dutch word for “cinchona”) Bureau, based in Amsterdam. It set the prices for producers and purchasers. In 1942, the Japanese conquered the Dutch East Indies and seized control of the cinchona plantations, severing the Allies' supply and provoking experimentation with other natural and synthetic antimalarials. After the war, the cinchona plantations on Java were reestablished, but the new synthetic antimalarials, such as chloroquine, had come to replace most of the demand for quinine from cinchona.

By 3000 BCE, the first system of cities, with Uruk at its center, emerged in Mesopotamia. Urban centers have played important roles in human history since, by exerting economic, political, and cultural influence over large populations. As the portion of the world population inhabiting cities has grown over the past several millennia, urban centers have become larger and more influential.

World history is sometimes viewed as the history of cities because urbanization has been coextensive with the portion of human experience commonly portrayed in world histories—that is, the past five or six millennia. Indeed, the study of world cities and their interrelationships can offer useful insights not just into the growth of a central form of human organization, but also into world history itself, especially in terms of these three questions: (1) How are world cities defined and identified? (2) Over the entire time span of world history, which cities were world cities, and can they meaningfully be regarded as the centers of the world system of their time? (3) What are the major outlines and trends in the system of world cities?

What Is a “World City”?

World cities can be defined as cities of world importance, actually and potentially. The source of that importance might be either a city’s size or its position in the functioning of the world system. *Size* can be reckoned principally in terms of population numbers (compared with other cities of that same era)—and with distinctions made among world cities of the ancient,

classical, and modern periods—because over historical time cities have grown larger by orders of magnitude. The term *world system position* might, in the most obvious case, refer to a place in the global economy, either in a commercial role or a productive capacity. For instance, the capitals of powerful or strategically important states and the military garrisons they might harbor will be politically important, and religious centers will attract interest and visitors from afar. There have also been cities noted for their cultural assets and the excellence of the learning they afford. Large cities have often been multifunctional; large populations, in turn, provide fertile soil for innovative enterprises. It is hard to find a single, dominant world city over the past several millennia, but sets of urban centers can be identified and examined for their form and composition, and for the connections among them (for example, were they imperial or nonimperial?).

Identifying world cities primarily by size, both spatial and temporal, is useful because in a survey of this scale it’s not practicable to make an empirical, detailed, and documented assessment of world system position. The ancient era (about 3000 to 1000 BCE) takes into account cities with settlements whose population may be estimated (for instance, on the basis of archaeologists’ site reports) to be in excess of 10,000; the population of most such cities are in the range of 10,000 to 100,000. The classical era (1000 BCE to 1000 CE) considers urban centers with populations of 100,000 or more, most typically in the range of 100,000 to 1 million. For the modern era (since 1000 CE) the focus is principally on cities with populations in the range of 1 to 10 million.

Until quite recently the prevailing view held that a statistical description of urbanization prior to about

This Japanese woodblock print by Utagawa Kunitoku shows various modes of transportation used in Tokyo in the nineteenth century, from carriages and rickshaws to tricycles and trains. Library of Congress.

1800 was impossible. But new sources have opened up—for instance, in archaeology and social and economic history—that make that task less difficult. The pioneering effort in this regard has been Tertius Chandler's *Four Thousand Years of Urban Growth* (1987), a product of decades of research that brought together a mass of material on cities between 2250 BCE and 1975 CE. Complementing and extending that work has been George Modelski's *World Cities: -3000 to 2000* (2003), which provides fuller coverage for the first four millennia but deals more lightly with the data from 1000 CE onward; it also reports on world trends in urbanization.

The Ancient World

The first city system emerged in southern Mesopotamia in the fourth millennium BCE in what the archeologist Vere Gordon Childe dubbed the “Urban Revolution.” This group of urban settlements

centered on Uruk, clearly a major cult center; Uruk was probably also a focus of political activities and was almost certainly the center of regional exchanges whose reach extended from Iran in the east, to the upper Euphrates in the north, and to Egypt in the west. By 3000 BCE there existed in this area (and nowhere else) some half-dozen units that satisfy this survey's criteria for an incipient world city system. Uruk was at that time the largest among them and the largest city in the world at that time, with a population possibly reaching forty thousand. And this is just one reason for calling it the first world city, because it is also known, from archaeological and literary evidence, that Uruk was the likely locus of the invention of writing and of calendars, innovations that proved to be of epochal significance.

This was the Uruk nucleus of an emerging system of world cities. The first basic, identifiable trend was the emergence, by the mid-third millennium BCE, of a viable and productive center in Sumer, the heartland

of cities, which was then organized in the form of some two-dozen autonomous city-states. An increasingly costly competition for regional leadership animated those states (for example, by about 2300 BCE, the competition between Umma and Lagash), which made it possible for Sargon of Akkad, from outside the Land of Sumer, to step in and subdue them. The reign of Akkad and Sumer came and went, and was followed by a native dynasty based on Ur. As late as about 2000 BCE something of a numerical parity existed between Sumer and non-Sumer cities, but a short time later the former land of cities completely dropped out of sight. By contrast, important cities rose in Egypt (Memphis, Thebes, and Heliopolis), in north Mesopotamia (Mari), and in the Indus Valley (Mohenjo-Daro and Harappa).

The second basic trend was the experience of dispersal, or more precisely, the spread of urban practices throughout Eurasia that coincided with what in several areas were described as “Dark Ages”—for instance, in Sumer, in the Harappan region, and in post-Mycenean Greece. By the end of the ancient era (and the Bronze Age), three of the four major regions of the “Old World” had been fertilized by the Urban Revolution: West Asia (for instance, Babylon), the Mediterranean (Mycenae), and East Asia (Yin, near Anyang, a major Shang capital). The less-than-successful experiments in the Indus Valley, in the Ukraine, and even in Peru would ultimately bear fruit, too. This dispersal was in fact a form of redistribution, because while Sumer lost cities and was virtually deurbanized, urbanism rose elsewhere and the number of world cities remained about the same as it had been a millennium earlier (twenty-two in 2000 BCE became twenty-three in 1200 BCE). In other words, the ancient era witnessed rapid urban expansion at the center in its first half, followed by deceleration and dispersal in the second.

The Classical World

The principal tendency of the classical era was the rapid formation and subsequent consolidation of strongly regional but also interconnected urban

systems in the four main regions of Eurasia: East Asia, South Asia, the Mediterranean, and West Asia. A separate development also occurred in the Americas. In the first three of these regions a thriving system of independent city-states developed, which then succumbed to imperial rule; but in West Asia, the sequence is reversed, and in Mesoamerica, the Mayan system of city-states collapsed by itself into incoherence.

In East Asia, virtually all the principal urban growth occurred in China. Haoqing (near Xi'an) was the Western Zhou (1045–771 BCE) capital and ceremonial center that bridged the ancient and classical periods. After its destruction in 771 BCE, the political center shifted to Luoyang, and in this Eastern Zhou era (770–221 BCE) that followed, urbanization took off with considerable flourish. One Chinese historical record credits ninety-one cities as likely founded before 771 BCE, the number rising to 466 in the Spring and Autumn period (770–476 BCE) of Eastern Zhou. City building was apparently part of state building, with the term for “state” (*guo*) denoting a walled city. While many of these cities were quite small, in no time a system of independent and flourishing states arose, each anchored in a major city with merely nominal and ceremonial links to Luoyang.

That, in turn, left the field open to immensely destructive wars, in what came to be known as the period of Warring States (475–221 BCE). The most ruthless and warlike of these states, Qin, conquered all the others and founded the first imperial dynasty 221–206 BCE). But that proved short-lived, and the Han dynasty (206 BCE–220 CE) that replaced it quickly built a great new capital, Chang'an (Xi'an), while continuing Luoyang in a secondary role. Chang'an and Luoyang each had their good and bad times (the former was largely destroyed in 189, sacked in 315, plundered in 756 and 763, and subjected to a bloodbath in 881; the latter was utterly destroyed in 189 and 190, sacked in 311, and declined after 907), but they continued to alternate as China's leading cities right until the end of the classical era, when Kaifeng assumed a central place in the Northern

Citizens of a nineteenth-century Chinese city stroll along a protective wall.

Song (960–1126). By that time Kyoto (Japan) and Sorabol (in Silla, Korea) also joined the ranks of world cities in eastern Asia that accounted, in the classical era, for about one-third of the world's major urban potential.

The South Asian experience paralleled that of East Asia, albeit on a smaller scale, in that the first millennium BCE saw a flourishing of cities in a context of autonomy, in north India in particular, a process that was then set back by the founding of imperial structures and by external incursions. Out of a cluster of tribal units an urban landscape emerged in the Ganges Valley that in turn coalesced into a system of independent polities that became the seedbed of Buddhism. However, a recent study of the sites of the capitals of sixteen of these early historic states showed them to be in the range of 50 to 200 hectares, suggesting populations smaller than their counterparts in China of that time and falling below our threshold.

Over time, one of these became the dominant power and formed the core of an empire centered on Pataliputra, on the Ganges, a large city that greatly impressed a Greek ambassador about 300 BCE. In the second half of the classical era the focus of north

India shifted to Kanauji, which became the capital of the Guptas and continued as the centerpiece of regional politics until it was sacked by Muslim armies in 1018 and then destroyed. In the south, Buddhism gained an early foothold in Sri Lanka at Anuradhapura and came to radiate its influence throughout Southeast Asia, including Sri Ksetra in Burma (now Myanmar), Palembang in Srivijaya, and Angkor in Cambodia.

The Mediterranean was the focus of the other major urban network of the classical world, equal in weight to East Asian. The Mediterranean network began to form later in the ancient era but quickly expanded via three great waves of urbanization: the Phoenician, the Greek, and the Roman. In about 1000 BCE Tyre sent a first colony to Cyprus, and soon its settlers founded Carthage, which in short order became the powerhouse of the western Mediterranean. Pliny the Elder, the encyclopedist, put its population, prior to the start of the wars with Rome, at 700,000, probably too high but indicating its reputation. The second wave came from the Greek world, under the sponsorship of individual cities. For example, Corinth initiated the foundation of Syracuse, on

The harbor of Hong Kong, a major center of trade and commerce.

Sicily, whose defeat of the Athenian expedition tipped the scales in the Peloponnesian war, and which may have been, about 400 BCE, the largest city in the Greek world.

But the greatest impetus to Hellenization came from the conquests of Alexander of Macedon (Alexander the Great), the founder of numerous cities. The most important of these was Alexandria, which became the capital of the post-Alexandrine rulers of Egypt, the Ptolemies, who fashioned it not only into a center of political power, and of trade and shipping, but also equipped it with a great lighthouse on Pharos Island, a beacon to ship-farers and a symbol of enlightenment for a city boasting of a *museion* with its huge library. A city that was home to many nationalities, Alexandria became the first exemplar, in Stoic thought, of a *cosmopolis*, a city of the world, a higher formation than a mere *polis*.

The last wave was that of the Romans, builders of an empire, but also builders of cities. Rome annihilated Carthage (but within a century put a new city in its place) and conquered Alexandria, to become

the imperial capital of this new Greco-Roman world. It grew to huge proportions, to become the world's most populous city, its citizens, untaxed, living off free bread, slave labor, and other spoils of empire. The sack of Rome in 410 CE marked the start of the collapse of Western Rome and the definitive onset, in this part of the world, of the second Dark Age.

Which was the city whose population was the first to attain 1 million? The estimates for Alexandria, at about 100 BCE, tend to put it in the 500,000 range, but some scholars claim that it might have reached 1 million between 200 and 100 BCE, which would make it first. But a more conservative guess would be Rome about 1 CE. The next city to reach "millionaire" status was Tang era Chang'an, at between 700 and 800 CE.

Early in the classical era, powerful west Asian empires, in particular the Assyrian and the Persian, pressed upon the Mediterranean world, probably pushing the Phoenicians out to sea and impressing the Greek world. But the collapse of the Persian realm diminished the vitality of that region and reduced its

Table 1.

*These are partial lists of the number of cities.

urban potential, and it was not until the Muslim conquests of the seventh century that new political and urban space opened up to become what is now called the “Muslim world.” Arab cavalry armies overthrew the Sasanian Empire and overran large portions of the Eastern Roman Empire based in Constantinople.

Urbanization became one of the hallmarks of the Muslim world. Many cities were conquered, such as Alexandria and Antioch, others were destroyed, such as the Sasanian capital, Ctesiphon, and yet others founded, among them Fustat, and later Cairo, al Kufah, and Basrah, as well as Baghdad and Rayy (later to become the seed of Tehran), together with Kairouan and Cordova (as a capital) in the west. By 900 CE, the Muslim world had the densest urban network; it was a principal precinct of the world system on the eve of the modern era.

Each of the four regional processes in Eurasia in the classical era had its own developmental trajectory, but these processes were not isolated phenomena but were entangled in several ways, though seldom in a complete fashion. They can be seen as a world city system with two chief lines of communication: the overland Silk Roads, via Central Asia, and the maritime Spice Roads, via the Indian Ocean. Both in effect bound east Asia to the Mediterranean. The world cities basically formed one system, with routes that served as links among the cities. These were not just trade routes but also the paths taken by new ideas and social innovations such as Buddhism.

The one area of significant urban development that stands apart was in the Americas, between

400 and 800 CE in particular, cities in Mexico (Teotihuacán), the Mayan lands (Tikal, Caracol), and possibly even Peru, created a conceivable nucleus of a regional city system. But the system was short-lived and largely collapsed after 800. Anthropologist David Webster questions the urban character of the Mayan cities in particular, and suggests that they were actually “king-places” or “regal-ritual” cities whose single-functionality was one reason for the fragility of the system when it was exposed to environmental stress and persistent warfare.

The Modern World

For the modern era, this survey returns to a unitary vision because the threshold criterion rises to 1 million, in other words, to “millionaire cities” that, at least initially, were few in number. (See table 1.)

The table depicts a process that over the course of one millennium raised the number of modern world cities from one, to 300, a rate of urban expansion never previously experienced. What is more, most of that expansion occurred in the last one or two centuries.

To start with, the urban landscape at the turn to the second millennium continued as it was in 900, with a central role for the Muslim world and strong Chinese participation. But then, soon after 1200, disaster struck. In a space of two or three generations, the Mongols captured all the “millionaire cities” and seized control of the Silk Roads, even while laying waste to north China and Central Asia, destroying and massacring

A view of central São Paulo. Now the largest metropolis in South America, the city sprawls over 7,800 square kilometers and is the corporate headquarters of Brazil's most important firms.

the inhabitants of Beijing, Merv, Samarkand, Herat, and Baghdad. When they faded away, one century later, this was still the “Asian age,” but the spirit had gone out of it, and the Silk Roads withered.

Viewing the table of modern world cities, an “Asian age” might still be seen right up to 1800 because all the world’s major cities were then Asian, if not actually Chinese. But on closer inspection that is less of an indicator of wealth and power than a symptom of stagnation because the table shows, before 1800, no evidence of growth, only some form of musical chairs. The growth that mattered was happening at the other end of Eurasia, in Western Europe, but it was, for a while, still under the radar. The growth factor initially rose from the city-states, Genoa and Venice, and in the Low Countries, whose experience was by 1500 translated into that of nation-states. Portugal, Spain, and the Dutch Republic assumed increasingly important global roles spearheaded by their enterprising cities—Lisbon, Antwerp, and Amsterdam. These were experiments in new forms of global organization that reached maturity with the experience of Britain. By 1800 London broke through to the “millionaire city” league, which suggests that innovation is not just a product of city size.

The list for 1900 offers a clear picture of the urban structure that shaped the world of the nineteenth and twentieth centuries: the strong British stake earned in

the Industrial Revolution, with London, Manchester, Birmingham, and Glasgow; the then-new, and rising, United States’ challenge, with New York, Chicago, Boston, and Philadelphia; the traditional great powers of Europe, with Paris, Berlin, Vienna, Moscow, and St. Petersburg, and somewhat marginally, Tokyo, Beijing, and Calcutta.

By 2000 the urban landscape was much changed. The figure reported in table 1, some three hundred cities for that year, means that the population of world cities became too numerous to be shown in that small table. In that year, all the world’s regions were now fully represented. The largest single share was that of east Asia which, at over one-third, was not really surprising, for this is about what its share was in the classical era. Overall, the world city system had moved into a new configuration and scholars are now at work to clarify the nature and composition of this new system.

Major Trends

Over the past several millennia cities have emerged and have grown bigger and better, and their weight in the social makeup of the human species has kept on rising. By the start of the twenty-first century, one-half of the world’s population was living in cities, and 10 percent in world cities alone (compared to about 1 percent in the ancient and 2 percent in the classical worlds). What is more, because of the concurrent rise in the same time frame of the overall population of this planet, from maybe 6 million to over 6 billion, the absolute number of people living in cities is the highest ever.

The world cities have composed, over the millennia, the center of the emerging world system, but their story can never constitute the entire picture, for it neglects all those living outside the great urban centers, those in the peripheries and in the hinterlands of world history. In fact, the process of interaction between the centers and the peripheries has been a major and recurrent feature of the world system. Thousand-year-long sequences of concentration, which brought city building, may have alternated with periods of redistribution that show stable if not

Tianjin, a municipality in northeastern China, is home to the country's sixth largest urban population.
Philip Baguet.

stagnant urban conditions, and these, in the past two instances, gave rise to Dark Ages. This raises the question of whether the urban expansion and concentration recently and prominently underway might not be heralding the onset of a new age of redistribution.

The world cities might be thought of as making up a complex, interlinked system in a condition that might be termed “urban entanglement.” In approaching this

system, the useful starting point is the presumption of connectivity; in other words, what needs to be demonstrated is isolation and lack of contact rather than the reverse, which is currently the standard. If world cities have formed a system, then that system might be thought of as having emergent properties over and above the characteristics of its members, such as the alternation of phases of concentration and redistribution just mentioned.

More generally, the world city system might be viewed as a component of world system evolution. The eras of world history (ancient, classical, and modern) could be considered as phases of that process, and such eras display quantitative features (such as changes in magnitude) as well as qualitative changes (such as the scope of the network). Therefore, world urbanization, which is a key component of globalization, might also be usefully studied as an evolutionary process.

Citizenship

Citizenship in a polity not only signifies membership in that community, but also the rights and duties that come with it. The ideal of citizenship grew from ancient Greece and Rome, but it has varied with the world's shifting political paradigms, expanding to allow more people into its framework.

The core meaning of *citizenship* is membership in a community. Beyond that core meaning, conceptions of citizenship have changed greatly over time and place, as to the nature both of the community and of the membership in question. Classically and enduringly, citizenship has been about a *political* and often a *legal* relationship: a citizen is a member of a polity by virtue of reciprocal rights and duties shared in common. As a membership status and as a behavioral norm, then, citizenship bespeaks an equality of citizens; but citizenship also thus entails inequality, in distinguishing citizens from noncitizens.

Classical Origins

The historic origins of citizenship lie distinctively in ancient Greece and Rome. Unlike the advanced civilizations that developed in the river valleys of ancient Mesopotamia, Egypt, and China, the classical civilizations of Greece and Rome were founded on the primacy of the city-state regime. The city-state (*polis*) of fourth-century BCE Athens produced the first classic theorist of citizenship, Aristotle (384–322 BCE), who expounded Athenian citizenship as a matter of “democratic” self-governance, with citizens (*polites*) at once “ruling and being ruled.” Notably, however, most

of the adult inhabitants of Athens—women, slaves, and even resident aliens such as Aristotle himself—were not eligible for citizenship. Citizenship was thus a privileged legal status and a restricted participatory civic ideal. In the Roman republic, with its earliest territorial expansions in the fourth century BCE, the government began to extend the status of the citizen (*civis*) far beyond the city of Rome itself, in order to secure Roman rule. Expansions of the republic, however, increasingly precluded an active political role for most citizens, who had no opportunity to participate in the institutions of government, which remained centered in Rome. Even in the late republic of the first century BCE, however, an ideal of “civic virtue”—of the citizen’s devotion to the polity—shaped Roman public culture, as exemplified in the classic legacy of the philosopher, politician, and lawyer Marcus Tullius Cicero (106–43 BCE). During the ensuing centuries of the Roman Empire, however, citizenship became principally a formal matter merely of imperial jurisdiction and administration. With the decline of centralized imperial rule in the fourth and fifth centuries CE, the classical idea of citizenship went into eclipse.

Medieval Eclipse and Neoclassical Renaissance

During the medieval period it was not only the collapse of centralized government that diminished the significance of citizenship in the European West; the rise of Christianity brought a profound challenge to the classical primacy of citizenship as a societal ethos. According to the great Church father Augustine

Voting is the least arduous of a citizen's duties. He has the prior and harder duty of making up his mind. • Ralph Barton Perry (1876–1957)

The Roman Senate. Although the republic extended the status of “citizen” far beyond the city limits, government institutions remained centered in Rome.

(354–430 CE), in his masterpiece of Christian cosmology *The City of God*, men’s allegiance to a “heavenly realm” posed a superseding alternative to all earthly allegiances. Furthermore, throughout medieval Europe the growth of feudalism brought regimes of decentralized government based on networks of inherently fragmented political allegiances. Citizenship, as it had in Athens, once again came to refer typically to association with a city or town. Citizenship meant the enjoyment of “liberties” as privileges or immunities granted to the members of a local urban community in its corporate capacity, for example, the English borough, the French *bourg*, and the German *burgh*.

The revitalization of urban life in parts of Europe eventually brought enhanced meaning to citizenship, notably among the preeminent city-states of Renaissance Italy. The commercial and civic vitality of such cities and the revival of the study of Roman law in leading universities fostered a neorepublican ideal of participatory citizenship. This neoclassical conception of citizenship in early modern Europe was elaborated in a rich literature of “civic humanism,” most famously, from the pen of the Florentine politician and scholar Niccolò Machiavelli (1469–1527).

Sovereignty, “Civil Society,” and Revolutions

Dating from the early modern era, the rise of powerful nation states found legitimization in cogent theories of monarchical sovereignty, such as those of Jean Bodin (1530–1596) and Thomas Hobbes (1588–1679). Such theories held that political identity lay in the direct personal relationship of every “subject” to the “sovereign.” Even in regimes of absolute monarchy, however, modern individual identity tended over time to become more than a matter of the political status of the “subject.” Commercial development brought increasing political and extrapolitical significance to individuals’ economic and social endeavors in the milieu of “civil society”; and the activities of civil society promoted attitudes of citizenship that supplemented and complemented the civic identity of the “subject.” This incremental reconception, from “passive subject” to “active citizen,” was also promoted by the very statism of centralizing national regimes, not least, for example, in their efforts to routinize general taxation. But, even more important, in England, America, and France, respectively, revolutionary neorepublicanism generated profound reconceptions of citizenship.

In reaction to absolute monarchy, including struggles for religious toleration and freedom, notions of popular sovereignty began to cohere in various theories of rights, whether legal or natural, that focused on the political importance and integrity of the individual. In England among the propertied elite, there emerged a developing political culture of individual “patriotic” vigilance against arbitrary government that climaxed in antimonarchical revolutions in the seventeenth century and that became institutionalized in the eighteenth. During the European Enlightenment more generally, various “social contract” theories accorded an essential civic role to the individual, for example, in Jean-Jacques Rousseau’s (1712–1778) morally impassioned vision of the *citoyen* as the individual constituent of “sovereign” government, and in Immanuel Kant’s (1724–1804) seminal philosophy of modern liberal individualism.

In medieval Europe citizenship was determined by a hierarchal series of allegiances leading to the monarchy. From top, left to right: (1) Knight of the Garter, (2, 3) warriors, (4, 5) serving men, (6) male citizen, (7) female citizen, (8) minstrel, (9) lady of rank, (10) Richard III, (11) Margaret of Scotland, (12) knight, and (13) the Earl of Warwick.

It was, however, in the late-eighteenth-century republican revolutions in America (1776–1783) and France (1789–1799) that modern democratic conceptions of citizenship were first constitutionalized and institutionalized. Drawing on but also transforming English constitutionalism, the new American nation reconceptualized citizenship as a matter of the constitutionally guaranteed fundamental legal rights of individuals. And American law increasingly emphasized the central idea of volitional allegiance as the essence of citizenship. An American law of naturalization, even more liberal than its English precedents, thus developed to supplement the long-

standing tradition of citizenship as a status typically acquired on the basis of birthplace (*ius soli*) or parentage (*ius sanguinis*). Inspired in part by the American Revolution, the epochal French Revolution, in its natural rights theory, exalted the ethos of citizenship. Moreover, the distinctively antifeudal animus of the French Revolution infused subsequent European ideals of citizenship both with intensified nationalistic sentiments and with burgeoning aspirations for social and economic equality.

Nationalism and Twentieth-Century Vicissitudes

The nationalism and egalitarianism of the French Revolution, together with the individual-rights ideology of American constitutionalism, shaped ideas of citizenship throughout the Western world for most of the nineteenth and twentieth centuries. Especially in parts of Europe, identities based on race or folkways variously informed ideas of citizenship. Such particularization of the concept of citizenship accorded with the historicism predominant in much European thought, especially as influenced by Georg Wilhelm Friedrich Hegel (1770–1831). At the same time, however, the egalitarian dynamic in citizenship took on increased meaning, especially insofar as representative democratic regimes fitfully expanded the scope, and extended the distribution, of the legal rights of citizens. Amid this growth of representative government, the right to vote became especially emblematic of modern citizenship.

Nevertheless, in addition to the inequality entailed by the distinction between citizen and noncitizen—for example, in national legal regimes of immigration restriction and regulation—modern citizenship has admitted of egregious internal inequalities. In various countries, attributes such as gender, race, and religious affiliation have long into the modern era remained the basis for denying to many adult members of society some of the most important incidents of full citizenship, including property rights and the right to vote. Even more pervasively, according to the critique of Karl Marx (1818–1883) and many later

A poster from 1919 urges immigrants to become American citizens. Library of Congress.

variants of Marxian theory, the economic regimes of capitalism of the modern West have commonly institutionalized a model of “bourgeois citizenship” that, despite incidents of formal equality, nevertheless entails profound material inequality among the citizenry.

In the first half of the twentieth century, totalitarian revolutions and two world wars brought cataclysmic disruptions of the emergent culture of modern liberal democratic citizenship. As the political theorist Hannah Arendt (1906–1975) and others began to remark at mid-century, modern citizenship has importantly come to mean the right to have rights; but in various contexts—for example, under the government of fascist or communist dictatorships, and, quite differently, among certain stateless and disaffected populations living without the protections of effective government—the personal guarantees of liberal democratic citizenship have at times been marginalized or rendered nil.

Modern Welfare State and Liberal Democracy

In the aftermath of World War II, especially in conjunction with a European reinvigoration of the modern welfare state vision, there was a return to politically engaged theorizing about the progressive capability of the concept of citizenship. Formative work in this vein includes the classic article

“Citizenship and Social Class” published in 1950 by T. H. Marshall (1893–1981). Marshall posited an historical schema of the development of the rights of citizenship in Europe in which three categories of rights—civil, political, and social—were successively ensured to citizens in an evolutionary process of legal and political reform. And in Marshall’s influential view, the history of this evolutionary progress of reform attests to the inherent potential of the concept of citizenship for generalizing, indeed, universalizing conditions of substantive equality.

The concept of citizenship remains a central concern among theorists of liberal democracy. Neo-Kantians, such as John Rawls (1921–2002) in America, and “critical” theorists such as Jürgen Habermas (b. 1929), have led vigorous contemporary debates about citizenship. And liberal “communitarian” theorists such as Michael Walzer (b. 1935) have focused on the idea of citizenship in trying to appreciate the integrity of discrete political communities today in an international arena in which both armed conflict and rational globalization seem endemic.

Complexities and Expansions

Indeed, nothing is more characteristic of the contemporary significance of citizenship than the evident complexity and expansibility of the concept. For example, in well-established “federal systems,” such as those of the United States and Germany, national and state governments, respectively, accord distinctive status and extend independent benefits that create “dual citizenship” in those countries. There are also countries, such as Canada and Israel, which liberally allow dual *national* citizenship with other countries. And the growing integration of the European Union has heightened interest in what “multi-national” and “international” citizenship should and could mean today, legally and culturally. Moreover, there is even a vibrant new school of thought that seeks to promote both an ideal and a program of “world citizenship.”

Yet the variety of the complexities of modern citizenship includes even more than systemization

through regimes of federalism, internationalism, or cosmopolitanism. In an increasingly pluralistic world, where the populations of so many countries include ethnic and other “minorities,” citizenship can or should be necessarily “multicultural.” Conceptions of citizenship can be intercultural, as well: in China, for example, modern thinking about citizenship blends Western and Japanese influences with Buddhist and other indigenous traditions. And in but one paradoxical example of illiberal “modernization,” some newly independent southern African countries have drawn on traditional European notions of patrilineal citizenship in order to enact laws that burden women with civic disabilities that depart from precolonial regimes of greater gender equality.

In the modern West and throughout the world, the meaning of citizenship continues to change with the vagaries and initiatives of legal, political, economic, and social change. It is clear, however, that citizenship generally remains both a desired status and a cherished ideal. Indeed, the prospect for the twenty-first century is that, in a world culture of growing claims for political and social inclusion, citizenship will take on ever greater significance as a strategic concept in the public life of communities, from the smallest to the largest.

Civil Disobedience

Acts of civil disobedience have their roots in religion and the desire to honor a “higher law.” Today the term *civil disobedience* refers to any public, nonviolent act against authority. Such acts are not committed for personal gain, and maintain a goal of righting an injustice or abuse of governmental policies and laws.

Civil disobedience refers to a deliberate offense against authority committed openly to protest an unjust, arbitrary, cruel, pointless, or immoral law or policy of the government. It rests on the assumption that there is a “higher duty” or “higher cause” than civil authority. Civil disobedience, however, does not refer to just any kind of deliberate violation of law or government policy. Street crimes such as robbery and burglary are committed from motives such as personal gain and malice. The civil disobedient, on the other hand, is not interested in private or personal gain; rather, the purpose of civil disobedience is to protest an injustice or a wrong.

Defining Elements

The philosopher John Rawls formally defines civil disobedience as “a public, nonviolent, conscientious yet political act contrary to law usually done with the aim of bringing about a change in the law or policies of the government” (1971, 368). The important defining elements of civil disobedience in this definition are *public*, *nonviolent*, *deliberate unlawfulness*, and *conscientious*.

A Public Act

Civil disobedience refers to action that is of a *public* political nature. Acts of disobedience to family and school do not qualify as acts of civil disobedience. Rather, in engaging in openly announced defiance of particular laws or customs, activists are interested in demonstrating that they are withholding allegiance from the state until its alleged abuses are corrected. In addition, civil disobedience is often engaged in with prior notice as well as openly, since the protestors want as much publicity and attention as possible so as to draw attention to the injustice or wrong that is the subject of the protestors’ acts.

A Nonviolent Act

Civil disobedience contrasts with acts of “warfare against the state” such as assassination, sabotage, terrorism, riot, insurrection, and revolution. Civil disobedients engage in a kind of resistance within the accepted political structure, a violation of the law without loss of respect for law and the other basic political institutions. Civil disobedients want their acts to be *nonviolent* so that they can convince the majority of their fellow citizens that the acts are indeed conscientious and sincere and that the acts are intended to address what they perceive as an injustice or wrong.

Deliberate Unlawfulness

The civil disobedient can use one of two types of *deliberate unlawfulness* to protest an injustice or

Disobedience is the true foundation of liberty. The obedient must be slaves. • Henry David Thoreau (1817–1862)

Congress of Racial Equality conducts a march in memory of African American children killed in Birmingham bombings, All Souls Church, 16th Street, Washington, D.C. Library of Congress.

wrong. Direct civil disobedience is a type of deliberate unlawfulness that violates the very law that is the target of the protest. White people sitting in the “black section” of segregated buses in the 1950s is a good example of direct civil disobedience. More characteristically, the civil disobedient uses indirect acts of civil disobedience; that is, the act of civil disobedience violates some other law whose reasonableness is not in question. For example, one does not protest capital punishment for murder by committing murder. Rather, one may protest such perceived wrongs by the disruption of traffic into a correctional facility where an execution is scheduled.

A Conscientious Act

This element excludes motives of private or personal gain or malicious emotion as the primary reason for

the action. For example, Mohandas Gandhi subverted colonial rule in South Africa and India with acts of passive disobedience. By so doing, civil disobedients suffer inconvenience, expense, threats, real danger, and eventually punishment. Their willingness to suffer these consequences helps to demonstrate that the purpose of the acts is to protest an injustice or a wrong.

Political Authority and Civil Disobedience

Judeo-Christian traditions and political philosophy teach that there is a principle of obligation higher than that of human authorities of the political communities, and that in a conflict between the higher and the lower, the higher takes precedence. Three classic statements on civil disobedience by Henry

Martin Luther King Jr. advocated civil disobedience as a way to prod government into a dialogue that would lead to a solution.

David Thoreau (1817–1862), Mohandas Gandhi (1869–1948), and Martin Luther King Jr. (1929–1968) can illustrate this relationship between political authority and civil disobedience.

Thoreau's essay "Civil Disobedience" is perhaps the best-known American statement on the right of the solitary individual acting alone against a government that had allegedly abused its authority. Its immediate historical context was America's war with Mexico. In protest of that war, Thoreau refused to pay his taxes, a gesture that led to his spending a night in jail. In "Civil Disobedience," Thoreau argues that it was individuals and not the government that created the conditions for liberty. Moreover, societal reform does not occur through politics. The regeneration of society, Thoreau insisted, must begin with self-regeneration not political participation.

Mohandas Gandhi was a Hindu religious leader and social reformer in India who advocated the use

of noncooperation and passive resistance to achieve social and political reform. He believed that it was not sufficient to rely on persuasion or appeal to authorities to voluntarily change their unjust ways. The condition that justifies civil disobedience is the fundamental violation of human rights. But Gandhi thought that individuals should resort to civil disobedience only after careful consideration and only those who are qualified should practice it. To be qualified, a person must already have acquired the habit of willing obedience to laws; those who have not learned to obey laws for the right reason do not have the right to disobey the law.

One of the best-known statements on civil disobedience is the "Letter from the Birmingham Jail," written by Martin Luther King Jr. King wrote this letter following his arrest for refusing to halt a large civil disobedience campaign. King called upon citizens to become more involved in politics in order to secure the voting rights that had been denied to black citizens. He believed that civil disobedience presupposes recognizing political authority. King also conceived of civil disobedience as a crisis-heightening tactic that would prod government into a dialogue that would lead to a solution.

Contemporary Issues

The historical tradition of civil disobedience lies in religious conscience. Acts of civil disobedience arose because of the individual's need to remain true to the dictates of "higher law." Although the tradition of civil disobedience motivated by religious conscience has not disappeared, it is no longer the primary source for its manifestation. The modern discussion of civil disobedience often occurs against a background of acknowledged just constitutions, democratic parliaments, and valid laws. The citizen, in engaging in a disobedient act, makes claims that are based on the nature of his membership in a society.

Civilization, Barbarism, and Savagery

Victorian-era anthropologists widely accepted the terms *savagery*, *barbarism*, and *civilization* to describe the perceived progression of human society from the most primitive forms to the most advanced. Such distinctions, however, reinforce xenophobic views used throughout history to justify hostile acts toward dissimilar cultures.

Civilization, barbarism, and savagery are three powerful notions. At least since the eighteenth century, they have played an important role in the human sciences, even as the vocabulary for these notions has shifted over time. During this same span of time, these notions have also played a central role in numerous ideologies of empire, exploitation, and genocide. Ultimately scholars of world history and other social theorists must ask whether intellectual uses of the terms *civilization*, *barbarism*, and *savagery* can ever be free of these sociopolitical uses and consequences. Or is it the case, as the French anthropologist Claude Lévi-Strauss (1908–2009) has suggested, that to affirm the distinction between civilization, on the one hand, and barbarism and savagery, on the other, is to take a fateful step into practicing forms of barbarism and savagery, in the sense of behaving toward Others in the fashion imagined to be characteristic of barbarians and savages?

Before Anthropology

The term *civilization*, as the embracive term for humanity's cumulative achievements through time, did not appear before the second half of the eighteenth century, when it emerged in both French and Scottish

intellectual traditions in the context of rising confidence in the progressive character of human history. Yet, for centuries before that, words derived from the Latin *civilitas* were used, often in association with *barbarism* and/or *savagery* (and their grammatical variants), to differentiate a speaker's own properly organized society from the inferior life-ways of Others. As this formulation indicates, in these primary, or uncontested, uses of these terms, one finds a consistent conflation of the distinction between Self and Other with the distinction between superior and inferior peoples.

Though the terms *barbarism* and *savagery* circulated as contrasts for *being civilized*, the two terms of inferiority had roots in distinct axes of comparison. *Barbarian* entered Greek as a term for peoples who, it was held, lacked intelligible speech. *Savagery*, on the other hand, emerged from the Latin *sylva* and referred specifically to those who lived in the woods, with human life in this habitat being taken as the antithesis of the "civil" society of cities. Yet etymologies, even true ones, are socially significant only when people are aware of the origins of words; etymologies do not automatically come into the meaning of a word when it is used. Indeed, during the centuries before the time when Victorian anthropology codified a distinction between *savagery* (as the earliest stage of human development) and *barbarism* (as the stage after *savagery*), the terms were used largely interchangeably, without their distinct "roots" making much difference in their usage. Yet it does seem as if these "roots" shaped the overall pattern of their referential use prior to the Victorian era and thereby conditioned the way the terms were later formalized

in Victorian anthropology as sequential stages of human progress. During the centuries of “European expansion,” between c. 1500 and the Victorian era, peoples who inhabited forests and jungle were far more likely to be encountered overseas than on the Eurasian margins of Christendom. Consistent with this, the term *savage* came to be linked more tightly than the term *barbarian* to the peoples of the lands of “exploration” and “discovery,” notably Africa and North America. In this way it seems that *savages* came to be the more extreme contrast with *civilized* society. Finally, it should be noted—given that so few white people in the United States are aware of the fact—that at many moments during the history of the Americas, the term *savage* has had an expressive force and significance comparable to that of *nigger*.

We should also record, however, that nearly from the outset of early modern “discovery” and “exploration,” there were potent protests against the use of *barbarians* and *savages* as terms for Others. In 1550, for instance, Father Bartolomé de Las Casas (1474–1566) attacked the jurist Juan Ginés de Sepúlveda’s claim that Indians were “barbarians,” although, significantly, Las Casas’s famous *Defense* was based on a systematic myopia in regard to many of the ways in which Aztec society was unlike that of “civilized” Christians. Moreover, consistent with his largely assimilationist vision, Las Casas conceded that Indians were “barbarians” on the basis of religion, because of their lack of Christianity. Some three decades later, however, the French essayist Michel de Montaigne (1533–1592) offered a more radical critique of the conceptual distinction between *civilized* and *noncivilized*. In his essay, “On Cannibals” (1580), he wrote: “I find that there is nothing barbarous and savage in this nation, by anything that I can gather, excepting, that every one gives the title of barbarism to everything that is not in use in his own country.” Montaigne’s essay shows us that the struggle against Euro-centered ethnocentrism is not an invention of our time but is instead longstanding—preceding even the formation of what we today know as “Europe.”

Victorian Anthropology

It is during the final decades of the nineteenth century, in the classic works of Victorian social evolutionary anthropology (e.g., Morgan, 1877), that we find the most thorough attempts to render *civilization*, *barbarism*, and *savagery* as stabilized terms of a formal and objective scientific discourse. This instance of scientizing both presaged and overlapped the production of “scientific racism.” In Victorian anthropology, *savagery* and *barbarism* were differentiated as sequential stages of social evolution. This schema reflected a much broader and quite sharp increase in the use of time as an idiom for conceptualizing human social variation, which arose in the wake of the “revolution in human time,” itself located at the end of the 1850s and the beginning of the 1860s. In the new understanding of time, the beginning of human existence was located vastly deeper in the past than in the biblical chronology of some six thousand years. Concomitantly, recorded time suddenly appeared to be no more than a miniscule segment of the entirety of human existence. In this new intellectual context, Victorian anthropology identified living “savages” and “barbarians” with the newly recognized expanse of prehistory—peoples lacking writing with the time before writing—in support of elaborate models of generalized stages of human social evolution that, scholars held, preceded the advent of civilization.

Within anthropology, this pairing of living Others and prehistory, along with the knowledge produced in this way, came under scrutiny from Franz Boas (1858–1942) and his students. Social change, the Boasians argued, did not proceed along a singular or universal path, as Victorian social evolutionary theory required. Moreover, other societies in the contemporary world were not the equivalents of earlier stages of European societies but were instead the present-day outcomes of quite different trajectories through time, reflecting other cultural values. The diversity of human societies in the world could not be mapped on to a singular path of human social

Allen's Law of Civilization: it is better for civilization to be going down the drain than to be coming up it. • Paul Dickson (b. 1939)

evolution, but instead, exhibited a “great arc” of human possibilities (Benedict 1934, 24).

Language provided a crucial test of these issues for the Boasians. Starting from painstaking analyses of myriad non-European languages, the Boasians concluded that the existing languages of the world were equally “evolved,” as judged by their capacities for effective communication and conceptual abstraction. Linguistic differences were real—and took forms far more fantastic than could have been imagined without ethnographic research—but different languages could not, with any validity or objectivity, be sequenced. In sum: the view that Others lack intelligible speech, or are otherwise barbarians, is an ethnocentric illusion—exactly as Montaigne had argued 350 years earlier.

The Boasian critiques turned cultural-social anthropology sharply against social evolutionary models. In addition, through undergraduate teaching and the public circulation of some of their work, the Boasians fostered a nontrivial degree of self-consciousness among a wider public about the ethnocentrism present when others are deemed *savages* or *barbarians*. Yet, it is also important to recognize the incompleteness of the Boasian displacement of social evolutionary thought. One important index of this incompleteness is the vocabulary that they endorsed (by example, at least) as a substitute for *savages* and *barbarians*—notably the term *primitives*. *Primitives* carries a social evolutionary vision of the human career in time: it points unabashedly to a much earlier past, and it associates both simplicity and a lack of development with temporal earliness. In this way it is a sanitization, more than an exorcism, of the Victorian anthropological meanings of *savagery* and *barbarism*. Moreover, what we too often overlook in evaluating this sort of shift in labeling is that if we use a new term to refer to the same set of elements as a previous term or terms—as when people use *primitives* to refer to peoples previously known as *savages* and/or *barbarians*—we leave intact the underlying classificatory distinction, in this case the distinction between *civilized* and *precivilized*. In other words, when we reproduce patterns of reference, we also reproduce categories of language and thought.

Disciplinary History

Although social evolutionary thought was to a significant degree displaced within anthropology by the Boasian critiques, it is also the case that such thought was transposed into other sites, within and outside of the academy. Disciplinary history is a key example. Although the new chronology of the 1860s made historical time but a brief portion of human time and thereby established a novel meaning of *history*, historians of the late nineteenth century steadfastly disregarded the new understanding of human time. In this way, history as a scholarly activity avoided affiliating itself too closely, or at least too quickly, with the rejection of biblical authority represented by both anthropological models of *civilization*, *barbarism*, and *savagery*, on the one hand, and Darwinian theories of speciation, on the other. This situation changed during the first decades of the twentieth century with the work of James Harvey Robinson (1863–1936), the primary exponent of the “new history.” The long chronology was a central and abiding concern in Robinson’s work. For Robinson, it provided a vantage and scale that dwarfed the details of history on a smaller scale and thereby made visible the overall trajectory of the human career: it was the “building of civilization.”

That Robinson’s embrace of the long chronology brought social evolutionary thought into his “new history” is particularly evident in his entry “Civilization” in the 1929 edition of *The Encyclopedia Britannica*. There Robinson bypassed the work of Franz Boas, who had been his colleague throughout Robinson’s twenty-three-year career at Columbia University, and endorsed the “ingenious analogies” drawn by “anthropologists” between “Tasmanians, Australians, Eskimos, etc.” and “the Neanderthal race.”

Consistent with this, Robinson was a central figure in the complex process that resulted in civilization, even more than the nation-state, becoming the most prominent unit of historical analysis in undergraduate teaching in the United States during much of the twentieth century. During the 1920s and early 1930s, it was primarily Robinson’s students, along with a small number of other historians greatly influenced

by him, who took the lead in introducing and institutionalizing what quickly became the standard survey of Western civilization (known as “Western Civ”). In so doing, these curricular innovators drew heavily on both Robinson’s essays and, even more directly, his graduate-level teaching at Columbia. In particular, Western Civ echoed Robinson’s “new history” in both its reliance on the long chronology and its presentation of history as the movement of the civilizational Self away from and ahead of primitive Others.

It is important to note, however, that even as Western Civ embedded social evolutionary thought in its narrative of history, it also promoted a broadly cosmopolitan ethos and worldview. With its focus on “the West” as a civilizational area, Western Civ encouraged its addressees (U.S. undergraduates) to identify with something above and less parochial than “the nation,” in contrast to the more narrowly patriotic form of history taught in secondary education. So too, the Western Civ narrative depicted Western civilization as drawing on sources from all over the map of Europe. It thus offered a welcoming tale to the children of immigrants who, during the 1920s and 1930s, were diversifying the student bodies on U.S. college campuses, supplementing and quickly outnumbering the children of the established Protestant elite. Finally, in the Western Civ narrative, civilization was something possessed not by virtue of birth, but rather by means of the transmission of knowledge—as in formal education and schooling. Western Civ thus offered an account of history that, allegorically, rejected the notion of ascribed status and affirmed the ideal of merit-based system of achievement. In sum, although Western Civ was always intensely Eurocentric (by virtue of identifying the West as the primary site and agent of the building of civilization), in its heyday it was also “cosmopolitan” and “progressive” in these nontrivial ways.

That social evolutionary thought had been elaborated as an explicit theory in Victorian anthropology was, ironically, an important condition of possibility for its critical examination by the Boasians. The movement of social evolutionary thought into history

produced much less critical examination, both in Robinson’s day and since. In part this is because social evolutionary thought was brought into history as an embedded schema, rather than as an explicit theory. In addition, even as history departments made Western Civ their primary introductory-level course, most historians worked, in their scholarship and other courses, with dramatically shorter segments of time in their research and upper-level courses. In so doing they set aside, but did not explicitly examine or critique, the social evolutionary vision of Western Civ. It would be an error, however, to overlook the extent to which the geographic coverage of history departments, and many other facets of the organization of historical knowledge, are shaped by the distinction between *civilization* and *precivilization*.

An important exception to the prevailing disciplinary practice of side-stepping this complex issue can be found in the field of African history, as evidenced by Steven Feierman’s essay, “African Histories and the Dissolution of World History” (1993). A primary target of Feierman’s discussion is the very notion of *civilization*. The civilization concept, says Feierman, involves “a complex of elements” that historians and other social theorists have claimed are mutually reinforcing: “political and economic hierarchy, towns, commerce and intercommunication, writing, the plough, high densities of population and historical dynamism” (Feierman 1993, 177). But when we broaden our research to include African histories, we find numerous cases in which these “interrelations do not hold” (Feierman 1993, 177). No basis exists, then, for continuing to treat these elements as the components and indices of a distinct stage (or even form) of human sociality. As Feierman concludes: “The elements have no explanatory significance if treated as a check list” (Feierman 1993, 178).

Moreover, if we stubbornly hold on to the civilization “complex” and insist on using it to perceive African histories, we will overlook and misrecognize quite different linkages. For example, Feierman discusses how trade in the Kongo during the seventeenth century—involving, on an annual basis, ivory from

as many as four thousand elephants and as much as 36 metric tons of copper—was supported not by anything recognizable as a “state,” but rather by a dispersed “healing association” or “drum of affliction” (Feierman 1993, 178). The overall point then is that the civilization concept serves us poorly when examining African histories, and this is sufficient to conclude that it lacks universal applicability and validity.

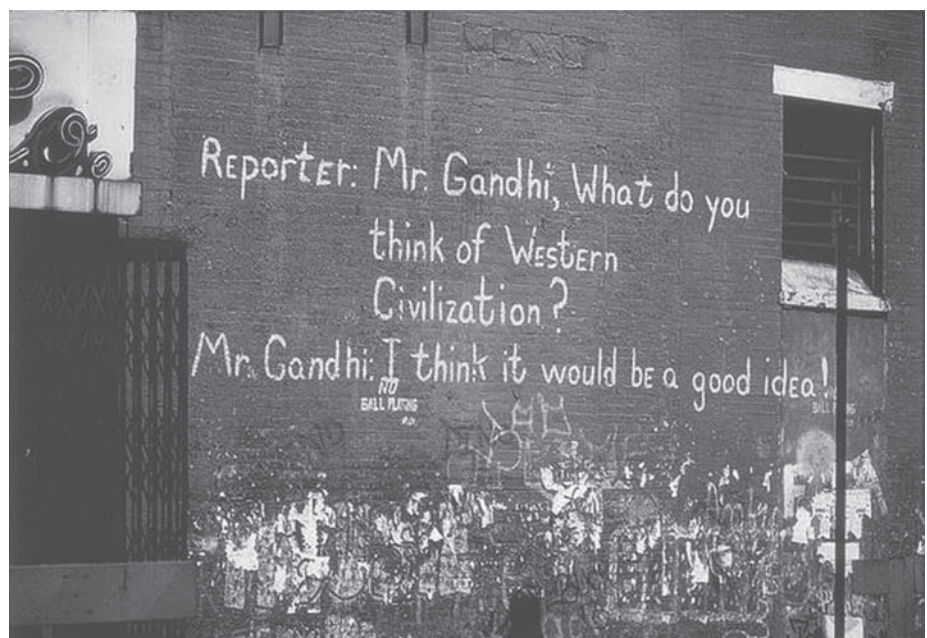

Contemporary Political Uses of Civilization

Research in both cultural-social anthropology and African histories thus contests the coherence of the *civilization/precivilization* binary. In addition, both fields have documented the recurring use of this distinction in support of projects of astonishing brutality, often in the name of “modernization” and “progress.” Nonetheless, the distinction remains a potent one, and has been used with particular verve by leading figures in the neoconservative movement, which, particularly in the United States, gained so much power after the 1960s.

The administration of President George W. Bush (in office 2001–2009), for example, repeatedly invoked images of a struggle between “civilization” and “barbarism” to conclude that the United States must wage war, rather than peace, in response to the violence of September 11, 2001, and other terrorist acts. Critics, however, argued that such rhetorical demonizing served to preempt a recognition of the modernness of so-called Islamic fundamentalism and of the primary factors that fuel global terrorism today, notably: (1) a widespread sense of desperation in many societies in response to the global maldistribution of political agency and the consumption of resources, (2) the global trade in weapons, including weapons of mass destruction, resulting largely from the Cold War, and (3) resentment in Islamic societies toward the U.S. government’s uncritical support for Israeli state policies of oppression toward Palestinians. The Bush administration’s goal of vanquishing the “barbarians” in our midst did not, critics argued, engage these root causes of terrorism.

A second context in which the neoconservative movement invoked *civilization* in recent years is

This popular, mass-produced postcard—its urban graffiti immortalizing an alleged exchange between Mohandas Gandhi and a reporter—attests to a critical sensibility in our world about use of the term “civilization,” and specifically about the term’s identification with the West.

in response to the movement to expand marriage to include same-sex couples. In February 2004, for example, George W. Bush endorsed an amendment to the U.S. Constitution to limit marriage to heterosexual couples, arguing that marriage so defined is “the most fundamental institution of civilization,” as demonstrated by “millennia of human experience.” (The most recent congressional votes on the amendment, as of 2010, took place 2006; the House of Representatives, which voted on the proposed amendment, did not garner enough votes to pass it; the Senate, which voted only on closure motions regarding the amendment, voted against considering it for ratification.) In response, the American Anthropological Association, drawing on its Boasian heritage, passed a “Statement on Marriage and the Family,” which reported that anthropological research offers no evidentiary support for Bush’s claims in this regard.

The distinction between civilization and precivilization is sufficiently established in contemporary knowledge of humanity that many, and perhaps most, world historians would question the idea of doing without it. Greater care and reform may be warranted, but not, on such a view, relinquishing the very idea of civilization. Yet for others, the intellectual and social-political record of civilizational thinking is sufficiently grim that, at the very least, the time has come for a moratorium on the use of notions of *civilization*, *barbarism*, and *savagery*—however euphemistically expressed.

Climate Change

Fluctuations in global temperatures throughout history have been accompanied by changes in sea levels and altered weather patterns, both of which have been linked to mass migrations, famines leading to disease, the collapse of some civilizations, and the growth of others. These cycles of warm and cold are affected by energy exchanges between oceans and the atmosphere, fossil-fuel emissions, and solar energy.

Many world historians explain changing Earth history in terms of its changing climate. Scientists however focus more directly on the causes for long-term climate change. They are: the exchange of energy by the oceans and atmosphere, fossil-fuel emissions, and solar energy. With global temperatures on the rise since 1860, climatologists predict that they may continue to increase by as much as 2°C during this century. Evidence of global warming appears in a melting Arctic ice cap—a reduction in volume of 3 to 4 percent each decade since the 1970s. As a result, sea levels have been rising since 1900 with the rate of change accelerating in the last half century. Contracting ice sheets and rising sea levels submerge coastal areas that affect the natural migration of some plants, animals, and microbes. According to the United Nations' Intergovernmental Panel on Climate Change (IPCC) report titled *Climate Change 2007*, "Warming of the climate system is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global mean sea level." During warming phases in the northern latitudes, migrating forests replace northern tundra and formerly marginal lands may become suitable

for cultivation and food production. The costs to millions and possibly billions of people who live near the rising seas, slightly above, at, or below sea level would be devastating as rising temperatures and volatile weather in the tropics and middle latitudes would displace them from their homelands.

Climate fluctuations from warm, temperate, and interglacial to cold, arctic, and glacial can occur rapidly within a century and without much warning. The final collapse of the last Ice Age occurred about 9500 BCE and marked the beginning of the current global warming period. This rapid atmospheric warming, possibly the most significant climate event in the last forty thousand years, caused abrupt rises in global sea levels. Warming and glacial melt at about 7500 BCE flooded the Black Sea basin. The biblical "flood" may have been a reference to this natural catastrophe. Although many gaps exist in our knowledge about climate warming and cooling, efforts to unravel the complexities of the global climate have focused on specific events that trigger changes in the weather.

The Atlantic Circulation Energy Exchange

The world's oceans serve as a heat transportation system absorbing much of the heat from the solar energy penetrating the atmosphere. As rising temperatures increase freshwater snowmelt, the salinity of the oceans decreases, affecting their circulation. Decreasing the volume of heavy salt water disrupts the great Atlantic Deep Water Circulation, which brings warm tropical water across the equator toward the North Pole. These warm waters become the "gulf

Polluted runoff is the greatest threat to U.S. coastal waters; accordingly, fossil fuel emissions are one of the leading causes of long-term climate change.

National Oceanic and Atmospheric Administration.

stream” that warms the New England coast and brings moisture and warmth to the British Isles. Without it, these coastal regions would become several degrees colder, turning fertile soil into permafrost.

Since the oceans transport heat, abrupt small increases in temperature or increases in fresh glacial melt lower the density of the water, namely its capacity to sink, slowing down and in severe instances stopping the circulation. According to some climatic models, turning off or slowing down this current, often called “a huge heat pump,” has cooled down the northern temperate regions and been responsible for many of the abrupt climate oscillations during the last 100,000 years.

El Niño

For the past forty years the salt content of the North Atlantic has declined continuously. But recent failures to simulate the relationship of these rapid climate changes to the Atlantic circulation have led scientists to search for another climatic event

that may contribute to either hemispheric or global climate change. They have concluded that the tropical Pacific Ocean and its El Niño episodes in combination with the Atlantic circulation may provide an answer.

As the world’s largest ocean, the Pacific covers about 181 million square kilometers, with the widest band along the tropics, where solar energy is converted mostly into heat. Ocean currents and wind velocity serve to distribute this heat. During some years, atmospheric and sea temperatures are abnormally warm for reasons that are not completely understood. These reasons may include sunspot activity, the effects of the Atlantic Deep Water Circulation, and the fact that the world’s oceans now consume a larger carbon load caused by fossil-fuel emissions.

Some climatologists believe that these anomalies may trigger El Niño oceanic conditions, meaning that the flow of cold water from South America to the warm Pacific pool decreases or ceases entirely. In the absence of the easterly wind shears that drive the surface cold water to Asia, westerly winds push the warm Pacific pool toward the Americas. Hot and humid air travels with this warm pool, soaking previously arid equatorial islands and the coastal regions of the Americas from Peru to the west coast of the United States with torrential rains. With accelerating westerly winds, precipitation extends into the Western Hemisphere from the Americas and Eurasia to the Russian plains. Drought strikes India, China, Indonesia, and Africa.

The impact of El Niño on the distribution of heat and precipitation around the world is well known. What remains unknown is the relationship between Atlantic and Pacific oceanic events on the global climate. Ocean temperatures and salinity influence circulation. In fact, some North Atlantic deep water may enter the equatorial Pacific and cool the water temperature and the atmosphere as it does in the Atlantic Ocean and in this way defuse the catastrophic climatic effects of El Niño. If the cold water circulation of the Atlantic slows or stops, however, then there exists no known constraint on El Niño’s harmful effects.

circulation, raised atmospheric temperatures, and created volatile weather.

By 1100 CE the warm period was giving way to the little Ice Age and mega-El Niños were in decline. With less energy transfer to activate the tropical oceans, one last major El Niño reached landfall in northern Peru in 700 CE. These pre-Spanish Conquest El Niños, similar to other major climatic events in world history, caused major political and cultural dislocations in the lives of native people. Floods in coastal areas and drought east of the Andes Mountains forced populations to relocate, rebuild, and adapt to the volatile weather systems that visited South America throughout this warming period.

El Niño's Impact on World History

Prior to the Spanish conquest of the Incas in 1500 CE, advanced civilizations of native farmers and fishermen spread out along the northern Peruvian coast. These Native Americans, called the Moche, built pyramids, crafted pottery, and made gold ornaments to celebrate their spiritual and material achievements. The remains of their irrigated canals and mud-brick buildings attest to their advanced civilization. The sedimentary evidence found in riverbeds, in coastal lagoons, and by examining the fossil remains in these sediments reveals that repeated episodes of El Niño disrupted Moche civilization. Floods and droughts forced the Moche to abandon established sites for newer ones. With more energy from the overheated oceans, mega-El Niños activated water and wind

El Niño in Recent History

Research into the history of the El Niño weather phenomenon stems from the discovery that the El Niños of the 1980s had worldwide effects. Because of drought conditions during that decade, peasants were forced to leave northeastern Brazil, political instability occurred in some sub-Saharan countries, and food shortages became commonplace in India, China, and Japan. El Niño weather systems prove unmistakably the connectedness of the global climate system and its specific effects on biological entities, historical developments, and local and regional weather patterns.

The El Niño events of 1982–1983 reinforce theories and knowledge about the energy exchanges of the world's cold and warm waters, especially in the

El Niño Watch: A satellite image shows the Pacific Ocean stabilizing, 11 July 1998. NASA.

Indian, Pacific, and Atlantic, by absorbing solar energy and releasing heat into the atmosphere. The destructive forces unleashed by El Niño episodes suggest that the world's oceans reach a point of energy overload and need to discharge their accumulated heat. In this way an unpredictable global climate system is brought back into delicate balance.

As we have seen, scientists have identified three basic causes of global climate change—the exchange of energy by the oceans and the atmosphere, fossil-fuel emissions, and solar energy. Much remains to be discovered about its causes and effects, however. Solar energy output has periodic and sometimes irregular patterns of intensity. Periods of high intensity occur during eleven-year cycles and those of low intensity take place about every three and one-half years. Although the similarities in the pattern are not conclusive, some scientists argue that El Niño returns at intervals of high intensity. Finally, no substantial body of

evidence points to a relationship between the warming of the Pacific waters in recent decades, a trigger for El Niño, and atmospheric pollution. Since much is unknown about El Niño, it remains an area of great interest for scientists and historians because of its potential effects on the global climate and global population.

The Role of Fossil-Fuel Emissions

Rising global temperatures translate into increased atmospheric water vapor, a greenhouse gas, as more of the world's warming ocean water evaporates, causing more precipitation. Releasing the energy sequestered for millions of years in fossilized plants and animals by burning coal, oil, and gas elevates concentrations of another greenhouse gas, carbon dioxide (CO₂), in the atmosphere. Most of these emissions come from three key sectors: electricity generation,

Due to climate change, sea levels have been rising since 1900 with the rate of change accelerating in the last half century. Researchers from NOAA's National Geodetic Survey conduct a shoreline survey. National Oceanic and Atmospheric Administration.

transportation, and the heating and cooling of residential, commercial, and public buildings. Electric power generation globally contributes 41 percent of all CO₂ emissions. During periods of industrialization, the burning of fossil fuels and the process of deforestation have increased the carbon dioxide load in the atmosphere by about 25 percent. Within the last hundred years, 40–50 percent of the world's pioneer forests and uninhabited lands that change CO₂ into oxygen by the process known as photosynthesis have been transformed into agricultural production and commercial and residential construction. Also caused by the burning of fossil fuels, other fast-growing greenhouse gases such as methane (CH₄) and chlorofluorocarbons (CFCs) with greater heat-absorbing qualities than CO₂ have affected atmospheric

temperatures. From 1850 to 2000, the human contribution to the increased concentration of CO₂ by burning fossil fuels, deforestation, and agriculture was about 1.7 trillion tons. About 40 percent of this CO₂ remains in the atmosphere and it is increasing at a rate of about 0.5 percent per year. The life span of CO₂ molecules in the atmosphere is one hundred years, meaning that the emissions from the first Model T automobile that became available to consumers in 1927 and every vehicle built since remains a part of the human-induced global carbon load.

Global warming occurs more rapidly in frigid regions rather than in the temperate and tropical areas because arctic air lacks water vapor. This characteristic makes CO₂ a more important greenhouse gas where the air is cold and dry. In warmer, humid air, water vapor is a more important as a transporter of heat than CO₂. Because warming is unevenly distributed across the planet, what exactly CO₂ contributes to global warming remains debatable.

During the current warming phase one can expect the physical properties of CO₂ to contribute to more rainfall, higher atmospheric and oceanic temperatures, more clouds, and higher wind velocity. The biological effects of CO₂ are noteworthy, contributing to longer growing seasons in the temperate and tropical climates. Arid and semiarid lands mainly unavailable for agriculture may receive sufficient moisture to increase food stocks for a global population whose growth rate will stabilize at between 9 and 12 billion people by 2050. The specific impacts of human population growth on the global climate system remain unknown, however.

The Role of Solar Energy

Two additional forces drive the global climate system. One cited often in the scientific literature but recently challenged is the Milankovitch explanation. The Serbian astronomer M. M. Milankovitch argued that the eccentric orbit of the Earth established its major global climatic cycle of 100,000 years. During that time the planet goes through a full interglacial/glacial cycle. Within this longer pattern, another

41,000-year cycle controls the amount of solar energy reaching the Earth's higher latitudes. It is caused by the tilt of the Earth on its axis.

A much shorter cycle caused by the “wobble” of the Earth on its axis occurs either at 23,000- or 19,000-year intervals and affects the amount of radiation striking the low latitudes and the equator. Milankovitch argued that during the last 800,000 years, Earth experienced eight complete glacial/interglacial cycles. The Ice Ages lasted for 90,000 years followed by 10,000-year periods of warming. Accordingly, the current interglacial phase should be coming to an end.

Since the Milankovitch explanation accounts for only 0.1 percent change in the total solar energy reaching the Earth, however, some climatologists have looked elsewhere for a more coherent driving force behind climate change. They argue that fluctuations in solar energy follow a cyclical pattern of sun-spot activity. Using this pattern, they have identified a pattern of eight cycles during the last 720,000 years of the Earth's history. They are ninety thousand years in length, from full glacial with -0.3 percent of solar energy output to full warming with $+0.3$ percent. Given the dynamic changes in the Earth's history and the gaps in our knowledge about its physical and biological properties however, predictions about future global climate changes remain illusive, despite the existence of this cyclical pattern.

Impact of Climate Changes on World History

A warming phase during the last major ice age from 33,000 to 26,000 BCE may have eased the migration of anatomically modern humans from Africa and southwestern Asia into Europe, replacing the resident Neanderthals. Before rising global sea levels eliminated the passage from Siberia to North America, this warming phase allowed human hunters to cross the frozen Bering Straits. In successive waves, possibly beginning as early as 32,000 BCE but no later than 11,000 BCE, they followed the hunt and populated the Americas.

As the last glacial maximum was ending about 13,000 BCE, a time when rising temperatures on Greenland approximated current ones, the retreat of the glaciers was interrupted by two little ice ages, the Older Dryas at 12,100 BCE and the Younger Dryas at 10,800 BCE. (A dryas is an Arctic flower that grew in Europe during the last Ice Age.) Evidence that the warm water circulation failed to reach the northern hemisphere around 12,700 BCE and inaugurated the Younger Dryas suggests that glacial melt entering the North Atlantic at the end of the last glacial maximum either slowed or stopped the Deep Water Circulation. It transformed the northern temperate regions into a little ice age for the next 1,300 years. The landscape of the British Isles became permafrost, with summer temperatures dropping below 32°C and winter ones below -10°C . Icebergs floated to the Iberian coast and long periods of drought affected Asia, Africa, and the midcontinent of North America. The slowdown of the Atlantic circulation may have been responsible for the changing hemispheric climate.

Climatic Impacts on Indo-European Civilizations

Little ice ages have punctuated world history during these warming phases. As a result of cooling, the once fertile pastoral civilization of the Sahara collapsed, forcing the migration of its inhabitants to the Nile River valley about 5500 BCE. This settlement along the Nile coincided with the millennia-long rise of the ancient Egyptian civilization. Between 5000 and 4500 BCE, the Egyptians established their first empire and within centuries built the great pyramids at Giza. The Harappa civilization in the Indus Valley flourished as well, constructing public buildings and private dwellings of mud and fired bricks and using geometric plans to organize its cities.

From 4500 to 3800 BCE, a “global chill” interrupted human progress with seemingly endless periods of drought. The global climate may have been colder than at any time since the Younger Dryas. As happened during earlier periods of cold and arid

conditions, the human population migrated south, escaping from the most extreme climatic conditions. Farming populations, the descendants of Indo-Europeans who in progressive migrations had brought farming technology into western and northern Europe from Southwest Asia many thousands of years before, were forced by the cold climate to retreat southward. They retreated to warmer regions along the Mediterranean and southeastward to Ukraine, to southwest Asia, India, and into northwest China.

Another protracted cold period brought drought to the irrigation-dependent “fertile crescent” civilizations of the Tigris, Euphrates, and Indus valleys between 3250 and 2750 BCE. In fact, some archaeologists suggest that the lush, naturally irrigated landscape in modern southern Iraq may have been the location of the biblical “Garden of Eden.” Recent archaeological research has verified that the collapse of the great agricultural Akkadian Empire in northern Mesopotamia (3200 to 2900 BCE) coincided with a major volcanic eruption and a subsequent climate shift from moist and cool to dry and hot that lasted for more than a century. These concurrent events forced this ancient population to leave the north and migrate into southern Mesopotamia (modern Iraq).

The Rise and Fall of the Mayan Civilization

Another global cold spell that lasted from 2060 BCE to 1400 CE had beneficial effects turning tropical and subtropical regions into cooler and dryer climates. In Central America, the Mayan civilization expanded its agricultural productivity northward into the Yucatan, now part of Mexico, and built pyramids and cities in areas formerly thick with tropical vegetation and malaria-bearing mosquitoes. They remained there for about a thousand years.

Years without rainfall caused a series of collapses in Mayan agricultural productivity. Sedimentary records suggest that droughts began 1200 CE and revisited the region for the next five hundred years. They abandoned some cities in 1240 CE and the remaining ones in 1190 CE, when another severe dry

period hit the area. Other causes may have contributed to the demise of the Mayans but the relationship of climate change to the collapse is a compelling one. After this particular global chill ended, the hydrological cycle gained strength as the climate warmed. The tropical forest returned along with the mosquitoes and forced the remaining Mayans to abandon their homes and to migrate southward. The fact that Mayan ruins are discovered now in the dense tropical rain forests of Central America is evidence of more recent global warming.

With the stronger hydrological cycle of the last 150 years, pioneers have cleared forests for agriculture, growing seasons have expanded, and more food has become available for a growing population. The relationships between climate change, the migration of human and animal populations, and the rise and decline of civilizations will require more detailed study before global climate change becomes more accepted as a causal factor in world history.

The Little Ice Age

Evidence from sediments and ice cores reveal that a little ice age (shorter than the typical 80,000 to 90,000 years) of long duration from approximately 1300 to 1850 CE swept across the northern hemisphere. Viking outposts in Greenland populated during the Medieval Warm Period (1000–1300 CE) succumbed to the freeze between 1200 and 1300. Food production plummeted in preindustrial Europe. Even in the best of times, where diets consisted mostly of bread and potatoes, daily food consumption seldom exceeded 2,000 calories. Widespread malnutrition was followed by famine and the outbreak of infectious diseases.

The bubonic plague followed the great European famine in 1400. Between 1100 and 1800, France experienced frequent famines, twenty-six in the twelfth century and sixteen in the nineteenth century. Increasing cold temperatures shortened the growing season by at least one month in northern European countries and the elevation for growing crops retreated about 18 meters. Not all populations suffered equally during this ice age, however. For those living

along major rivers and coastal areas, fishing provided the animal protein lacking in the diets of the majority. In New England, 1815 was called “the year without a summer.” After 1850 and without warning this little ice age came to an end. Increased solar energy, the impact of industrialization on the atmospheric concentrations of greenhouse gases and changes in the Atlantic Deep Water Circulation have been identified as causes, either alone or in combination.

Climate Change: The Future

Examining climate events in history and reviewing the scientific findings of the present suggest that no single cause can adequately explain significant climate oscillations. The convergence of many changes in the world’s oceans, atmosphere, and land causes the disruptions and outbursts that we identify as significant climate events. These events possess such complex and unpredictable characteristics that to date the most advanced computers and global climate models (GCMs) have been unable to predict future climate events.

Despite our fragmentary knowledge of past climate events, knowing what to do in the future presents us with a great challenge. Population growth into coastal areas and onto marginal lands makes catastrophes more likely during periods of abrupt change. Increases in material consumption and energy use will continue to place stress on global ecosystems. The goal of sustainable growth in the developed world and the expectations for the same in the developing world remain elusive. In the words of Vaclav Smil (1990, 23), “If concerns about planetary warming will help to bring some sanity into the craven pursuit of economic growth and personal affluence throughout the rich world, and if they will aid in promoting control of population growth and responsible development policies in the poor world, then a warming trend might actually be an effective catalyst of desirable changes.”

Clothing and Costume

Although clothing serves a basic human need for protection from cold and hostile elements of the environment, it has also been used as a visual cue for determining gender, profession, social and economic status, and birthplace. Clothing has been radically influenced by social contexts and by the technologies available for making it.

As early humans moved out of Africa and into colder, more hostile climates they were confronted with the problem of keeping warm. Without a thick coat of hair to protect them from the elements they had to create an artificial means of retaining body heat in order to survive. From this basic need developed the rich and varied dress of the world's peoples. As societies began to develop, many other factors determined the specific dress of a region or a culture, including the technological levels, relative affluence, class and hierarchy, migration, war, religion, and industrialization. Historically dress has provided people with a visual cue that allows for the instant determination of ethnicity, class, gender, profession, economic status, and even place of origin. It forms an important element in social, technological, and economic history and can be an excellent basis for the study of culture. People have used dress throughout history to both accentuate and obscure the body. Most cultures have particular dress for ceremonial occasions and life celebrations, thus dress holds a central role in ritual, social, and political life.

Early clothing was dictated not only by climate and environment, but also by available clothing materials. The earliest forms of dress were probably animal skins, at first used in their original shapes and later

modified to fit the human form. The invention of textiles increased the scope and variability of early dress. Despite the wide diversity of dress globally, early humans developed a limited number of basic garment shapes. The first woven garments were probably simple rectangles or squares of fabric draped or wrapped around the body. These multipurpose garments could be used as a skirt, cloak, or even as a shelter or bundle for carrying possessions. Its descendants include the Roman toga, the Indian *dhoti*, and the Indonesian sarong.

A hole for the head in the middle of the basic rectangle increased the possibilities for covering the body. This garment could be worn loose, like the Peruvian poncho, or belted around the body. The sides could be sewn up to form a closed garment, like the Greek chiton. The addition of sleeves created the T-shaped tunics of the Roman and early European medieval periods and even the humble T-shirt. By slitting the T-shaped garment down the front, coat-like overgarments such as the Arabian *abbaya* were created. In the steppes (vast, usually level and treeless tracts) of Central Asia nomads refined the coat by adding triangles of fabric to the front opening that overlapped the chest area. This garment, the cross-fronted tunic, influenced early Chinese and Asian dress and can be seen today in the Afghan and Central Asian *khalats* and even the Japanese kimono. Any of these basic garments could be worn in combination or in addition to skirts or pants to further cover the body and protect it from the elements.

After the basic necessities were taken care of, dress became more elaborate, formalized, and regulated. It began to differentiate one group, class, culture, or religion from another. Clothing that mirrored social

Traditional Korean clothing is designed to be light and airy; here two women in billowing dresses pose for a photographer in 2004.

divisions and defined subcultures allowed an instantaneous visual determination of the wearer's place and status. Any deviation from the norm could be read as a change of identity or status and determine who was friend or foe. Dress became even a tool of governmental social policy—to promote national solidarity, to define the limits of accepted society, and even to force modernization. The Russian czar Peter the Great's insistence on nobles wearing Western dress, and the Turkish soldier and statesman Kemal Atatürk's dress reform for Turkey, were attempts to achieve modernization through clothing reform.

Gender

Gender is an important component of dress. Most cultures have specific styles that differentiate or reinforce gender divisions and enforce gender and social stability. For Western societies gender dress has meant skirts for women and pants for men. This differentiation is not a global standard, and women often wear pants, whereas in other regions men wear "skirts," usually in the form of sarongs, hip-wraps, or kilts. The symbolism placed on a garment by a

particular society makes a garment "male" or "female." Gender-specific dress can accentuate physical differences between the genders and/or emphasize erotic areas of the body, often by deformation of the body by padding, corseting, or other means. In many cultures women's dress directly reflects the wealth of their husbands or fathers, making dress an economic indicator. Some forms of women's dress, such as foot binding in China, have become symbolic of women's reduced position in paternalistic societies. The Islamic veil, to many Westerners, symbolizes the subjugation of Islamic women. But for many Islamic women the veil is a symbol of religious identity. It is also an example of the strength of custom. Veiling predates the Prophet Muhammad by six hundred years or more and is not a requirement of the Qur'an. As Islam spread, religion and local customary practices became inextricably linked. Deveiling campaigns in the former Soviet Union, republican Turkey, and modern France have met with resistance by religious women who view the veil as an important part of their religious identity.

Dress also has served to identify and define class and to mark social divisions. Divisional dress predates the rise of consumerism and is tied to a desire

A pictograph of Sioux warriors killed in the Battle of Little Bighorn memorializes slain warriors identified by their costume, paint, and body adornment.

for upward mobility. Elaborate garments for the ruling elite highlight personal and national prestige and wealth and set the ruling elite apart from the rest of society. At the same time prescribed dress for those participating in royal courts limits their participation outside the rarefied atmosphere of the court. Expensive fabrics, trimmings, and extravagant cuts elevated the wearer above the working classes. This elevation came at a price. Women's fashionable dress in Renaissance Italy, with its ultrawide sleeves, restricted movement, as did the heavy woolen folds of the Roman toga. Court ritual in China required the emperor to comply with elaborate rules and highly specific dress requirements for rituals. He was both elevated and restricted by the same dress that reinforced his power.

Dress also can be used to enforce the status quo. Sumptuary (relating to personal expenditures) laws that govern the clothing of particular classes developed in early times. They are most numerous where class tension exists. During the early Ottoman Empire sumptuary laws were seldom published, implying that the social boundaries between classes were generally accepted. In early modern Europe, however, the frequent publication of such laws coincided with the struggle for power between the nobility and the rising middle class.

Just as dress can denote status, it can also denote subjugation. An example is the queue (a braid of hair usually worn hanging at the back of the head) and Manchu clothing that were imposed by the conquering Qing dynasty (1644–1911/12) on the ethnic Chinese. Clothing of subjugation can take on symbolic meaning and come to represent the political system that institutes it. Its removal also can take on political overtones. One of the symbols of the 1911 Chinese Revolution was severing the queues, although Manchu clothing was mostly retained because of its practicality.

Occupations

Within social divisions dress often became a marker for occupations. Specialized garments developed to protect workers or their clothing from the dangerous elements of their profession. Dress such as the blacksmith's apron or the baker's hat became integral parts of the craft or professional identity. In some cases, such as academic dress, specific garment details became institutionalized and continued as a marker long after their original purpose was gone. Today the color of one's collar is used to denote hierarchy in the Western workforce. Occupational custom could be so strong that workers had to fight for the right to wear more practical attire. U.S. nurses and female hospital workers faced both custom and gender boundaries in their battle to wear pants instead of skirts and white hose at work.

Dress can be an external expression of one's religious beliefs. For Christians, dressing the body

Rituals and ceremonies of many religions call for special clothes. Two Catholic girls wear traditional white dresses and veils for their First Communion.

is directly tied to the concept of original sin. For Orthodox Jews, Muslims, and people of many other religions, dress symbolizes their membership in a religious community and sets them apart from the surrounding societies. Religious attire may be differentiated by color, cut, fabric, or even, in some cases, the absence of dress itself. Like academic dress, clerical dress often contains stagnated forms of historical garments. Ritual dress for religious elites shows the power, prestige, and the wealth of the religious establishment. Modernization has altered Western religious dress, making it more secular in appearance.

A difference between urban dress and rural dress has probably existed since the development of cities, but industrialization and its accompanying mass migration of labor to the cities have made this difference even more striking. “Fashion” generated in the cities was part of the reason, but the availability of finer cloth and manufactured clothing also separated urban from rural. Workers adopted “city clothes” to

fit in and show their connection with their new environment, and a mix of urban and rural dress illustrates the mixed consciousness of early industrial workers. Strangely, fashion sometimes reverses this pattern, with urban residents adopting the clothing of the countryside in a nostalgic attempt to recapture a simpler past.

Modern manufacturing, communication, and advertising have increased the importance of fashion and the speed at which it changes and spreads, even creating an international fashion of T-shirts, blue jeans, and sport shoes that defies gender, nationality, and class. Although a Western “institutionalized fashion cycle” began in the courts of fourteenth-century Europe, fashion has likely been around nearly as long as clothing. Since prehistoric times, humans have shown an interest beautifying their clothing with beads, feathers, and other sorts of trim. They have also shown an interest in changing clothing styles, although at a much slower pace than today. Roman writers described the importance of fashion during their time, and during the Tang dynasty (618–907 CE) in China, feathered skirts were so popular that certain species of birds were threatened with extinction.

The words *native* and *traditional* are often used in dress history to imply something that is static and unchanging. These two words are often used interchangeably with the word *authentic*, implying freedom from modern contamination and a continued cultural longevity. Dress, however, like material culture in general, does not develop in isolation. It develops with internal and external forces. Modern concepts of “traditional dress” are often based on festival or ceremonial clothing and are divorced from what people actually wear on a day-to-day basis. Even such festival or ceremonial clothing is a hybrid of indigenous styles and outside or modern influences. African traditional clothing, for example, is a result of centuries of contact and borrowing from African, European, and Arabic cultures. Within these “traditions” runs a current of nuanced and ever-changing fashion that may be unnoticed by outside observers. Many wearers of “traditional dress” willingly trade customary fabrics for modern human-made

ones and incorporate “nontraditional” objects into their clothing in order to appear more fashionable.

The Hawaiian muumuu was concocted by missionaries to “civilize” the native population by covering its nakedness. “Native” dress in Central and South America, as well as in Central Asia and Africa, shows strong colonial influence, especially the multi-tiered flounced skirts. Western hats and garments of all sorts were adopted by indigenous peoples because of a desire to “fit in” or to mimic the ruling powers or in some cases because of market considerations. Native Americans adopted European garments and, like the workers of the industrial cities, combined them with their regular dress, creating a picture of mixed consciousness. Industrial development made fabric cheaper and often replaced native weaving styles and economy. The introduction of artificial dyes replaced natural dyes and increased the range of colors used in native clothing.

In some cases “traditional” dress has even been fabricated. The Welsh national costume for women was invented during the 1830s when Welsh advocate Lady Llanover (Augusta Waddington) romanticized Welsh country dress and published drawings and paintings of her fantasy costumes. By the twentieth

century this fictitious “Welsh dress” became a popular festival dress and tourist attraction. The Scottish and Irish “cultural revival” styles of the twentieth century are other examples of the fabrication or manipulation of existing styles for political purposes.

Dress forms a rich and varied component of global history. It can be used to illustrate economic development, social hierarchy, gender, modernization, and a multitude of other factors in human history.

Coal

Coal, a readily combustible sedimentary rock, fueled the Industrial Revolution of the nineteenth century. It was burned for heat to generate the steam that powered locomotives and machines, and it was an essential ingredient in the smelting of ore. Even though petroleum replaced coal as the most prevalent fossil fuel during the 1960s, coal and coke coal are still used for power generation and metallurgy.

People have known about coal since antiquity, but they did not begin to use coal for fuel on a large scale until the nineteenth century. The physical labor of humans and animals, firewood, and vegetable coal were the main energy resources until the first energy transition to the use of fossil fuels. The “wooden hunger” suffered by Europe during the seventeenth and eighteenth centuries as a consequence of high wood-energy consumption rates by metal foundries led to technical innovations known as “miners’ friends,” including steam pumping, which enabled the exploitation of coal mines and became the precursor of the steam engine. Such innovations allowed large quantities of coal to be extracted for use as coke fuel in smelting ovens.

The Industrial Revolution occurred mainly in the carboniferous basins of Europe, and coal was the main fuel for locomotives and other steam machines. The level of economic development in industrialized countries determined the chronology of their transition to the use of fossil fuels. A minor correlation existed between coal consumption and levels of industrialization during the nineteenth century. During this period the British fleet played an important role

in the expansion of coal use worldwide as British cargo ships monopolized the movement of coal.

In the nineteenth century, the work carried out in coal mines was done manually, frequently by children, and only pumping was mechanized. The mechanization of mine pumping spread to other aspects of mining works at the dawn of the twentieth century. Since then surface exploitation has increased, and the number of manual workers has decreased. Consequently, productivity has increased as labor conditions have improved and accidents have decreased.

Great Britain was the first society to use coal on a large scale for its everyday needs. A number of factors contributed to this. First, Britain had a lot of coal, much of it very conveniently located. Second, it was badly deforested relatively early, making the switch to coal imperative. Third, technological developments, especially in metallurgy and precision boring, facilitated the development in England of the world’s first economically viable steam engines, which were essential to pumping water out of the coal mines. Without steam power, it has been estimated, British coal mining could not have expanded beyond its level in 1700; instead it multiplied sevenfold by 1815, and almost a hundredfold by 1900. Coal mining elsewhere grew even faster in the late nineteenth century, albeit from a smaller base.

During the nineteenth century people were already becoming concerned that the supply of coal might run out. For example, the English economist and logician W. Stanley Jevons was concerned that the exhaustion of Britain’s coal supply might contribute to the decline of the British Empire. While new discoveries of coal might have helped to expand the empire, the

Camels in Beijing transport coal in the late nineteenth century. China's coal production has increased since the 1980s to help satisfy energy demands of rapid industrialization.

pollution caused by burning coal in domestic and industrial use endangered human health. For example, the high concentration of London smog during the period 4–10 December 1952 killed more than four thousand people.

The second major energy transition was to petroleum, but this transition did not end the use of coal. In fact, after the oil crises of the 1970s, a recovery in the use of coal took place. During the nineteenth century and until 1914, the eve of the World War I, coal provided about 90 percent of the primary energy from fossil fuels consumed in the world. Between 1930 and 1960 that percentage decreased from 70 to 50. The prevalence of petroleum was not settled down until the 1960s.

In the twentieth century two main markets for international coal trade appeared: (1) the steam coal market for power generation in Asia and (2) the coke coal market for use by metallurgists. Since 1978 world steam coal production has risen by more than 35 percent. The high price of petroleum since that time has fostered the recovery of coal applications in power-generating stations. In other words, the high petroleum prices during the 1970s meant that many power stations had to again use coal as a primary energy. However, coke coal production maintained its level during the 1970s.

Since the nineteenth century the geography of coal production and trade has changed considerably. In 1900 world production totaled 0.6 billion metric

This nineteenth-century machine, developed in Great Britain, accurately measured and weighed coal delivered to factories.

Coal loaded onto this lake freighter in 1943 at the Pennsylvania Railroad coal docks in Sandusky, Ohio, was intended for shipment to other Great Lake ports. Photo by Jack Delano. Library of Congress.

tons; the top producer was Europe with 0.45 billion metric tons (United Kingdom, 0.18 billion metric tons). World coal production rose steadily from 1 billion metric tons in 1946 to 3.6 billion metric tons in 1996. The United States produces 1 billion metric tons per year. China's production has grown since the 1980s to help satisfy the demands of the country's rapid industrialization. South Africa and Australia, basically export oriented, also have increased their production.

Ten countries have more than 90 percent of the world's known extractable coal reserves, which leads to a significant maritime trade given that coal is generally transported by sea. The threat of the exhaustion of supplies that worried W. Stanley Jevons has not eased. It is estimated that recoverable coal reserves are around 800 to 900 gigatons. At the current rate

of extraction this would last approximately 130 years. Given the annual increase in the rate of coal consumption, however, known coal reserves are more likely to be depleted in fifty to sixty years.

Coal remains the largest source of energy for the generation of electricity worldwide. But it is also one of the largest anthropogenic sources of carbon dioxide emissions. In the twenty-first century this represents a serious concern given the relationship between carbon emissions and the phenomenon of global climate change. Governments and the coal industry are working on new technologies such as "clean coal" and geosequestration but the future remains uncertain. In light of the dangers posed by climate change and associated environmental concerns there is a significant push on to find alternative cleaner sources of energy.

Coffee

As coffee spread from its native Africa to the Middle East, then to Europe and other parts of the world, it was transformed from the drink of a select few to a product for mass consumption. Throughout its rich and varied history, coffee has been associated with prayer, luxury, colonialism, and slavery. It has stimulated all manners and modes of conversation, energized the workforce, and affected myriad aspects of human life.

Coffee's indirect journey—from Africa to the Middle East, across the Indian Ocean to Europe, then to Latin America and the United States, and lately as far as Australia and eastern Asia—reflects its different uses throughout history by distant and distinct peoples. Coffee was first consumed by hunters and warriors; it became over time an aristocratic luxury, then a bourgeois treat, and finally, for many caffeine lovers, a necessity—only to reemerge in the late twentieth century as an object of distinction in the age of specialty beans and brews. Coffee production, marketing, and consumption have been intimately involved in the creation of the modern world, for good and for bad. Coffee has helped fuel the expansion of the modern world economy and has helped energize the industrial workforce. It also prolonged the use of slaves while industrializing food production and enriched colonial empires while heightening awareness of fair trade practices.

Origins

Although the origins of the term *coffee* are disputed, most scholars today agree that it probably derives from the corruption of an Arabic word *qahwah*, which

was a derogatory word for liquor, a prohibited beverage in Islam. Numerous species of trees and bushes and many more cultivars produce the “bean” for coffee, which is actually a seed more like the pit of a cherry. (“Bean” is a corruption of the Arabic word for coffee, *bunn*.)

Coffee appeared naturally in various parts of Africa. *Coffea arabica*, the most common and valuable species, spread from Harrar (today in Ethiopia), where beans were harvested from wild trees. There it was sometimes served as a hospitality drink flavored with salt, butter, or spices, or used as an energy pill for hunters, who included it ground with balls of fat to provision their trips.

Coffee's first appearance in history is disputed. Some scholars point to questionable passages in the *Odyssey* and the Bible as evidence of coffee's great antiquity. Others cite references in Arabic texts from around the year 800 CE. As far as world history is concerned, we can safely put the beginnings of coffee as a commodity at the end of the fifteenth century, but in Yemen, not in Ethiopia.

The Shadhili Sufi sect of Islam, based in Yemen, are generally accepted as the group who popularized a drink made from roasted and ground arabica coffee beans suffused in hot water. They certainly did not set out to stimulate world trade. On the contrary, they sought to flee the material world to reach spiritual fulfillment. The caffeine in coffee served to keep them awake in their religious chanting rituals, which they celebrated at night. But as worldly people with day jobs, they spread the popularity of the drink in the secular world as well.

By the middle of the fifteenth century coffee was so associated with Islam that the Coptic Christians of

Louis Haghe (lithographer) and David Roberts (artist), *The Coffee-Shop of Cairo*. By the middle of the 1500s the centers of coffeehouse culture were Istanbul, Cairo, and Damascus. New York Public Library.

Ethiopia forbade it. But Muslims found coffee—and the coffeehouses that sprang up to serve it—enticing. It was particularly well suited to the observation of Ramadan, the month of obligatory fasting during daylight. Coffee and the coffeehouse created a public nighttime activity. Muslims on pilgrimages to Mecca for the Hajj acquired the coffee-drinking custom and spread it as far to the east as Indonesia and India, west to western Africa, and north to Istanbul and the Balkans. Despite this growing market for coffee, until the end of the 1600s almost all coffee in world trade was grown in the small, irrigated gardens cut into Yemen's steep hillsides. Production was small, (12,000 to 15,000 metric tons per year) and the price high, enhanced by Ottoman taxes and the cost of transporting by camel caravans or boats.

Spread to Europe and Its Colonies

Coffee drinking spread nonetheless. By the middle of the 1500s the centers of coffeehouse culture were Istanbul, Cairo, and Damascus. Men from many walks of life enjoyed the drink and the cafés, which were centers of artistic, intellectual, political, and mercantile life (women only drank coffee in the home or at special baths).

European Christians adopted the habit of drinking coffee initially because it was associated with the

splendor and wealth of the Ottoman Turks, whose empire was at its height in the sixteenth and seventeenth centuries. Served in porcelain cups, newly arrived from China, and on plates made from Mexican silver, spiced with sugar from the Caribbean (Muslims had used cardamom rather than sugar) and joined with tobacco from the Americas, coffee was a mark of distinction for the rising masters of the world economy, who sipped it in luxurious salons.

Coffea arabica became a middle-class drink in England, where a Greek merchant was probably the first to open a coffeehouse in Oxford and then in London in the mid-1600s. The Puritan English became leading European consumers of coffee until tea overshadowed it in the 1700s. Northern Europeans adopted the coffee habit, and Amsterdam became the principal coffee market. This led the Dutch to seek to control production as well as commerce. Beginning in the 1690s, Yemen's leadership position in production was gradually dislodged when the Dutch transplanted coffee to their colony in Java (today in Indonesia). The French began growing coffee in the Indian Ocean island of Réunion and the British in Ceylon (today Sri Lanka). The eighteenth and nineteenth centuries witnessed the apogee of coffee colonialism. Almost all coffee was grown in Dutch, French, and British overseas colonies, with the French colony of Saint Domingue (today Haiti),

The coffee is prepared in such a way that it makes those who drink it witty: at least there is not a single soul who, on quitting the house, does not believe himself four times wittier than when he entered it. • **Charles de Secondat Montesquieu (1689–1755)**

Coffee plantation in Singapore in the late nineteenth or early twentieth century. Photo by Frank and Frances Carpenter. Library of Congress.

becoming the world's largest producer, exporting some 40,000 metric tons in 1789.

European control of the trade led to an intensification of the use of African slaves to grow the crop. Although slavery had been known in Ethiopia and Yemen, coffee producers seem to have been peasants, as they were in Java. But in Java, and later in Ceylon, growers and workers were often coerced into coffee cultivation. In Réunion and then the Americas, which had already imported millions of African slaves to grow sugar, coffee became connected with human bondage.

The nineteenth century saw another great transformation of the world coffee market as two new players entered the arena: Brazil (a coffee-producing nation) and the United States (a coffee-consuming nation). Brazil turned to coffee production after a slave revolt on Saint Domingue almost ended the island's coffee production. World prices skyrocketed. Brazil, independent after 1822, was the world's primary coffee producer by the 1850s. Its vast fertile fields and the importation of over a million African slaves (slavery was not abolished in Brazil until 1888) allowed Brazilians to lower production costs and reduce the world price of coffee. By late in the nineteenth century, coffee became increasingly a mass beverage available to the working class in both the coffee-buying and coffee-growing countries. This trend was particularly

noticeable in what became the world's largest coffee market, the United States.

As a tea-drinking colony under the British, the United States turned to coffee under the influence of the low price of Brazilian coffee and the immigration of millions of Europeans, for whom coffee was a status symbol. Per capita consumption grew in the nineteenth century from well under a pound in 1800 to thirteen pounds in 1900. World coffee imports grew fifteen-fold during the nineteenth century with the United States responsible for almost half the expansion of consumption. In terms of the value of international commerce, coffee trailed only grains and sugar as a world commodity in 1900.

Twentieth- and Twenty-First-Century Trends

The cultivar *Coffea arabica*, which had been virtually the only source for the world coffee economy since its inception, was joined by *Coffea robusta* at the end of the nineteenth century. Native to equatorial Africa, robusta matured faster and, more importantly, was resistant to the leaf blight, *hemileia vasatrix*, which destroyed the coffee plantations of Java, Ceylon, and the Philippines in the last decades of the nineteenth century. The robusta permitted those countries to return to coffee cultivation and spurred more dramatic changes in the world coffee economy of the twentieth century. Late in the twentieth century new variants of the arabica and the robusta that were shorter, more resistant to disease and direct sunlight, and with higher yields were developed. They led to more intensive farming, with five to six times more bushes per hectare and greater investments in fertilizers, pesticides, and processing equipment on smaller, monocultural plots.

The processing and marketing sides also reflected the greater dependence on capital. In 1900 green (raw and unroasted) beans sold according to their port of provenance comprised the great majority of coffee traded. Importers sold them to wholesalers, who roasted and ground the beans themselves or sold the green beans to consumers, usually housewives,

A coffee grower in Jamaica shows off berries ready for harvest. Photo by Carleton H. Graves. New York Public Library.

who did the final roasting, grinding, and brewing at home. Gradually packaged, industrially roasted and trademarked coffee took over the market. The vacuum-sealed can allowed local companies to become regional, and after World War II, national. The invention of decaffeinated coffee and instant coffee, which became popular after mid-century, increased the processors' share of the final retail price. Chain stores and supermarkets further concentrated production among an ever smaller number of huge roasters and food conglomerates. In the last decades of the twentieth century, mergers and takeovers allowed a few gigantic diversified companies to dominate production in many parts of the world. Large investments in advertising and market power to secure shelf space in supermarkets allowed the concentration of the industry to continue.

Until after World War II the largest share of the final price of green coffee went to coffee growers and merchants. As processing and marketing technology grew, a greater share of the final price was pocketed by the processors. Calculations vary greatly, but whereas growing countries by one estimate earned about half of the final price in 1950, today they take in only 10 to 15 percent, though marketers of what is

known as fair-trade coffee offer above-market prices to growers.

As early as 1906, growers began making efforts to protect their market share and to bolster prices on the world market, a trend that culminated in the 1961 International Coffee Agreement (ICA). The agreement was partially a result of Cold War fears that the 1959 revolution in Cuba would repeat itself in the poor and troubled coffee-growing countries of Latin America. For twenty-eight years the ICA negotiated quotas and prices with growers and buyers to insure that growers received a living wage. When the collapse of the Soviet Union in 1991 ended the Cold War, fears of Communist revolutions waned, and the United States decided to push for global free trade. Coffee support prices were among the first victims as the United States withdrew from the ICO. A handful of major food conglomerates became the masters of the world coffee economy.

Latin America, especially Brazil, is still the leading supplier. But its dominance has been challenged since the 1960s by Colombia and Africa, especially the Côte d'Ivoire, though production has fallen of late because of internal unrest. Vietnam, grower of low-quality robusta, suddenly became the world's second largest coffee producer, while Indonesia and India have once again become major producers. The 2010 World Coffee Conference in Guatemala focused on bringing large and small growers together to discuss trends in production, demand, and social and environmental sustainability. Because coffee-bean producing plants are notoriously sensitive, and small changes in temperature and precipitation can have big impacts on coffee quality and quantity, a warmer climate will encourage more coffee farmers to plant the heartier robusta varieties, which are caffeine-rich but bitter, instead of the mild, tasty arabica coffees preferred by people in the United States, the world's largest coffee consumer.

The per capita use of coffee in the United States, however, has steadily declined since the 1960s as consumers increasingly imbibe caffeine in soft drinks. Brazil is today the world's second-largest consumer, and Japan has become the world's fifth largest.

Chinese import of coffee doubled between 1997 and 2002, and it is still on the rise. Ironically, coffee, which originated in Africa and gained popularity in the Middle East five hundred years ago, is now seen in eastern Asia as a symbol of Western modernity.

Cold War

The division of conquered Germany, shortly after World War II, into a democratic Western state and a communist Eastern state signaled the start of the Cold War—a fifty-year series of political conflicts between capitalist and communist blocs. The collapse of the Soviet Union near the end of the twentieth century signaled the end of the Cold War.

Following the end of World War II in 1945, a new kind of war, a so-called Cold War, broke out. This new war centered on ideological and political conflicts, particularly the conflict between capitalism and communism. This Cold War, which turned hot several times, particularly in Korea and Vietnam, endured for nearly fifty years and affected most of the globe as countries increasingly had to choose sides with one of the superpowers (the United States and the Soviet Union) in an increasingly bipolar world. During conferences at Yalta (1943) and Potsdam (1945) it became clear that the individual nations that made up the allied powers had very different views regarding the shape of the postwar world.

On 5 March 1946, former British prime minister Winston Churchill made a speech in Fulton, Missouri, (now known as his Iron Curtain Speech) in which he defined the terms of this new conflict. According to Churchill, “From Stettin in the Baltic and Trieste in the Adriatic, an iron curtain has descended across the Continent.” In this speech, Churchill harshly criticized the actions of the Soviet Union. From this moment on, the same Stalin who had been called Uncle Joe during the war effort was now once again transformed into a dangerous and dictatorial enemy.

Cold War in Europe and the United States

In the United States, Cold War policies were set out in several early government documents. The first of these, which came to be known as the Truman Doctrine, was promoted in a speech on 12 March of 1947. In this speech, President Harry Truman declared, “I believe that it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures. I believe that we must assist free peoples to work out their own destinies in their own way.” In June of 1947, Secretary of State George Marshall set out the European Recovery Program (later known as the Marshall Plan), which provided for economic aid to back up the ideology of the Truman Doctrine. In his article in *Foreign Affairs* the diplomat and historian George Kennan set out the final plank in the Cold War platform of the United States. The “containment policy” that Kennan espoused became the rationale for most United States foreign policy behavior in the next forty years. Kennan’s policy of “containing” Communist nations later gave rise to the Domino Theory, that is, the idea that if one country fell to communism, others would follow (particularly in Asia).

The earliest strain in the Cold War came in Germany as the United States and Western nations merged their zones to create a West German federal government and worked to rebuild West Germany while denouncing the Soviet Union’s policies in East Germany. The introduction of a new currency in West Germany led to a Soviet blockade of West Berlin, which lay within East Germany and thus within the Soviet zone of occupation. In response to the

Winston Churchill, Franklin D. Roosevelt, and Joseph Stalin at the Livadia Palace in Yalta, 9 February 1943. National Archives.

blockade, the Allies managed to supply West Berlin through a massive airlift that lasted for over a year. Ultimately, Germany was divided between east and west and in 1961 the Berlin Wall went up, physically dividing the city of Berlin into two zones of power.

The Cold War also led to the creation of NATO (North Atlantic Treaty Organization), an organization that provided for the mutual defense and assistance of Western European nations against any hostile action by the Soviet Union. The Soviet Union responded by creating an alliance with Eastern European countries, known as the Warsaw Pact.

Asia

The agreements made at Yalta had provided a structure for postwar cooperation in Asia but these initial agreements soon fell apart. The Soviet Union had agreed to enter the war in the Pacific three months after the defeat of Germany and Stalin abided by this agreement. Roosevelt had agreed to allow the Soviet Union to establish a base at Port Arthur, China, in exchange for Stalin's agreement to sign a treaty of

alliance with Chiang Kai-shek's Republic of China. A Communist movement, viewed as a direct attempt by the Soviet Union to achieve the worldwide revolution that had been advocated by Lenin, had emerged in China in the 1930s. The Communist and non-Communist (Nationalist) parties in China had attempted to cooperate after the Japanese invasion but had been largely unsuccessful and both groups were anticipating a renewed struggle after the defeat of Japan. In 1949, the Nationalist government fled to Taiwan and Mao Zedong proclaimed the People's Republic of China. The United States refused to recognize Mao's government, instead maintaining ties to the Nationalist government in Taiwan. The United States lamented the "loss of China" and vowed to take whatever steps were necessary to prevent the spread of Communism throughout Asia.

The situation in Korea also deteriorated rapidly. The removal of Korea from Japanese control had been one of the stated objectives of the allies in World War II. Prior to the surrender of Japan in 1945, the United States and the Soviet Union had occupied the country, temporarily dividing it at the thirty-eighth

National Archives.

parallel. The allies planned to hold elections after the restoration of peace and allow the newly elected government to rule an independent Korea. However, tensions between the United States and the Soviet Union had led to the establishment of separate governments in North and South Korea. The Communist government in North Korea, with the approval of Stalin and the Soviet Union, invaded South Korea on 25 June 1950. As a result of a boycott of the U.N. Security Council by the Soviet Union, the United States was able to pass a resolution that labeled North Korea as an aggressive nation and called for U.N. forces to be sent to Korea. The U.N. forces, led by the U.S. general Douglas MacArthur, defeated North Korean troops and expelled them from South Korea. Subsequently, MacArthur and the U.N. forces crossed the thirty-eighth parallel and adopted a new mission, which aimed to unite all of Korea under a non-Communist government. China had issued several warnings that they might intervene if U.N. forces crossed the thirty-eighth parallel but these warnings were ignored. When the Chinese made good on their threat to supply both men and matériel, U.N. forces had to retreat back into South Korea. A defensive line was established near the thirty-eighth parallel.

Peace negotiations dragged on without result and the Korean War eventually ended in a stalemate. At the end of the war, Korea remained divided.

The other major “hot” war in the post-World War II period was also fought through the lens of Cold War tensions. The initial war in French Indo-China began as a result of the French decision to try to reestablish control of their colony after the war. War broke out between the French and Ho Chi Minh’s Indo-Chinese Communist Party in 1946. After the French fortress at Dien Bien Phu fell to Communist forces the French agreed to negotiations and the Geneva Conference in 1954 brought an end to the first Indochina war. The United States had sent considerable aid to the French in order to prevent the spread of Communism, while pressuring the French to agree to Vietnamese independence at a future date. The Geneva agreements had called for elections in Vietnam but as it became clear that free elections would most likely result in a Communist victory, the United States sought other solutions. The United States was increasingly unwilling to risk another Asian domino to the Communists. Thus, the United States supported Ngo Dinh Diem, who refused to agree to the elections called for by the Geneva Accords. Despite U.S. assistance South Vietnam was

on the verge of collapse by 1963. The United States responded by sending military advisers and increased material supplies. In 1965, the United States under President Lyndon Johnson began to send U.S. troops to Vietnam. President Nixon, under increasing pressure to end the war, bombed not just Vietnam but also Laos and Cambodia. The Treaty of Paris in January of 1973 ended the conflict. Two years after the war ended, South Vietnam fell to the Communists.

The spread of the Cold War to Asia led Southeast Asian nations to form an alliance in 1954, the Southeast Asia Treaty Organization (SEATO). This alliance was an effort to cooperate economically and also to resist further Communist encroachment in Southeast Asia. It included representatives of Australia, France, Great Britain, New Zealand, Pakistan, the Philippines, Thailand, and the United States.

Africa

Africa was more indirectly affected by Cold War tensions. Both the United States and the Soviet Union

directed economic assistance plans and policies aimed at securing Cold War alliances. But in the postwar world, African nations were occupied by the struggle for independence and faced significant challenges upon obtaining independence. Independence was achieved earlier in north and central Africa, where there were fewer white settlers, than in South Africa, where the white-dominated government struggled to maintain its position of power and the policies of apartheid.

The Middle East

The Middle East achieved its independence after World War II. Regional differences, territorial disputes, and the British mandate that divided territory between Palestine and the newly created nation of Israel contributed to instability in the area. The Arab-Israeli conflict also contributed to violence in the region. Arab nations cooperated in an attempt to defeat the Israelis and reclaim the territory occupied by the citizens of that nation. The emergence of

various militant religious groups radically altered the nature of many Middle Eastern governments, particularly in Iran. During the Cold War, regional problems were further complicated by the political interests of the United States and the Soviet Union, both of whom valued the region, partly because of the vast oil resources in the Middle East. Its strategic location and vast production of petroleum made the Middle East of value to all industrialized nations. The United States contributed money and material aid to the Israeli government and intervened in the area in an attempt to maintain its interests, both economic and military, in the area while the Soviet Union fought and lost a war in Afghanistan.

Latin America

The United States had inaugurated a policy of nonintervention in Latin America in the 1930s but reversed this policy after World War II. Communist movements and fear of the spread of Communism in addition to economic interests in the area were primarily responsible for the change in policy. In Guatemala, Jacobo Arbenz Guzmán came to power and began to reduce the influence and interests of U.S. businesses. The United Fruit Company, controlled by U.S. interests, noted that the Communists were involved in the changes and asked for assistance. A U.S.-led military operation successfully deposed Arbenz Guzmán and the new government repealed his land reform measures and jailed and murdered Communists. A small guerrilla movement of Communists and other nationalists emerged and violence continued for three decades.

In 1959, Fidel Castro came to power in Cuba, enacting a social and political revolution in Cuba based on Marxist ideas. He also initiated land reform, seizing all land from owners who had more than 165 acres. Economic sanctions by the United States and other countries who refused to trade with Cuba caused a rapid decline in the Cuban economy.

Cuba became a key nation in the Cold War struggle between the United States and the Soviet Union. The United States attempted to overthrow Castro by

landing Cuban exiles at the Bay of Pigs in 1961. After this failed invasion, Castro sought protection from the Soviet Union and vowed to spread Communism to other areas in Latin America. Although Castro failed to bring other Communist governments to power in Latin America, his alliance with the Soviet Union brought the world to the edge of a nuclear war during the Cuban missile crisis. The Soviet Union had agreed to install missiles in Cuba and to support Castro against further actions by the United States. In response, President John Kennedy ordered a naval blockade of Cuba, to prevent missiles from being sent to Cuba. Ultimately, Nikita Khrushchev backed down and agreed to dismantle existing sites and pledged not to install missiles at a future date. This direct confrontation and the realization of how close the world had come to nuclear war led to the installation of a direct phone line between the United States and the Soviet Union and subsequently to a thaw in relations and talks regarding the reduction of nuclear arms.

The End of the Cold War

Although there were earlier improvements in the relations between the United States and the Soviet Union and agreements to limit nuclear weapons (SALT I and SALT II), real change occurred only with the collapse of Communism in Eastern Europe and the Soviet Union. When Mikhail Gorbachev became premier of the Soviet Union in 1985 he began attempting to reform the Communist system. The two best-known aspects of his reform program are perestroika, the attempted decentralization and restructuring of the economy, and glasnost, a move toward free speech and a free press. Instead of the reform and revival that Gorbachev hoped would transpire, revolutions occurred in Eastern Europe and when the Soviet Union did not send troops to restore order, the Communist governments in Eastern Europe simply fell. The most prominent symbol of the collapse of the Communist regimes in Eastern Europe was the dismantling of the Berlin Wall in 1989 and the subsequent reunification of Germany in the 1990s. After

Whether you like it or not, history is on our side. We will bury you! • **Nikita Khrushchev (1894–1971)**

an attempted Communist coup in the Soviet Union in 1991, the Union of Soviet Socialist Republics also collapsed. Individual republics such as the Ukraine withdrew from the union and Gorbachev resigned as president of the union after an attempted coup by military and old-style Communists, which led to the rise of Boris Yeltsin as a political figure.

With the collapse of Communism, the Cold War that had dominated European politics for nearly fifty years was essentially over. Although Communism itself still existed in China, Cuba, and a few other areas, the dismantling of the Soviet Union seemed to signify its decline and the victory of democracy. The decline of the rivalry between the United States and the Soviet Union eased tensions and pressure on nations in Asia and Latin America. Nonetheless, the United States and the former Soviet Union continued to have very different views regarding world affairs. The end of Cold War tensions did not lead to the

destruction of NATO, but it did temporarily reduce tensions and end the nuclear arms race between the United States and the Soviet Union. It also paved the way for a reunited Germany and for Eastern European nations to join the European Union.

Colonialism

Colonialism, which involves the domination and exploitation of a native population, has been spurred by economic need or greed and political rivalries. Most historians contend that its costs—including loss of life through disease, relocations, and slavery; inhibition of local economic growth; psychological damage to colonized people; and cultural domination—outweigh any benefits, such as the development of an infrastructure for post-colonial modernization and democratization.

Colonialism, broadly defined as “a system of political, economic, and cultural domination forcibly imposed by a technologically advanced foreign minority on an indigenous majority” (Gellar 1995, 140), is a component of empire building, European expansion, and the creation of the modern world system. Its root word, *colony*, comes from the Latin word *colonia*, which referred to agricultural communities that produced food for the Roman Empire.

Colonialism probably goes back some six thousand years in human history to when humans first established settlements large enough to require more food than the surrounding area could provide to support their numbers. The first colonies were probably neighboring peoples whose land or labor (or both) were exploited for food. All classic preindustrial states were colonial in that they often took the land and exploited the labor and resources of subjugated peoples.

Extent and Causes of Western Colonization

Interest in colonialism in the modern era has focused primarily on Western colonialism from about 1500

to the present. Western colonialism has drawn most of the attention because it was so widespread and was a major force in human history. To give some sense of its breadth, consider the German geographer Alexander Supan’s observation that in 1900 European nations and the United States exerted colonial control over 90.4 percent of the territory of Africa, 98.9 percent of the Pacific islands, 56.5 percent of Asia, 100 percent of Australia, and 27.2 percent of the Americas. The major European colonizers were Great Britain, France, Spain, and Germany, with Portugal, the Netherlands, Belgium, and Italy playing a lesser role.

South and Southeast Asia were colonized at first by the Dutch, Portuguese, and Spanish; in the eighteenth and nineteenth centuries the British and French expanded into these regions as well. Africa was colonized by the British, French, Belgians, Spanish, Portuguese, Germans, Italians, and Spanish, with the last decades of the nineteenth and early decades of the twentieth century being the period of most intense colonization.

Colonization of the Americas began at the close of the fifteenth century and did not end until the close of the nineteenth century. Some experts argue that the United States replaced European nations as the colonial power in the Americas through its taking of Native American territory and its dominance over the economies and, at times, governments, of nations such as Honduras, Haiti, and Cuba. This form of colonization is referred to as informal colonialism because the colonizing nation does not have official control over the colonized nation.

In some cases, colonies were placed under direct control of the colonizing nation’s government; in other

This pictograph, which commemorates the Sioux victory over U.S. forces at the Battle of Little Bighorn, shows warriors leading horses with U.S. military saddles.

cases trading companies acted as intermediaries. Still other colonies were organized as protectorates, while some nations remained nominally independent but were run by puppet governments whose policies were ultimately controlled by a Western power (as in informal colonization). In some cases, the method of governing the colony evolved over time: British India, for example, was initially governed through the English East India Company but was taken over by the British government in 1858.

Some experts stress economic factors as the root causes of European colonialism; others stress political factors, and still others a combination of factors. Economically, the expanding world system in conjunction with the Industrial Revolution created greater demand for raw materials and markets for products. Colonies met both needs, as they provided raw materials at low cost and monopoly markets for European-produced goods. Politically, the colonial expansion of the mid- to late 1800s was fueled by national rivalries in Europe, balance-of-power concerns, and national pride. The Berlin Conference of 1884–1885 provided a political rationale for

colonization by stipulating that control of a territory rested on a colonial power's occupation of that territory. The technological advances of the Industrial Revolution, especially steam ships, railroads, the telegraph, and more deadly weapons, made colonization quicker, cheaper, and easier. Finally, it should be noted that the ideas of social thinkers such as Charles Darwin, Lewis Henry Morgan, Karl Marx, and Herbert Spencer were used or misused by colonists to portray colonized peoples as inferior and in need of Western civilization, education, democracy, and Christianity. Thus, colonialism was typically rationalized as being beneficial to those being colonized. It was, in the words of Rudyard Kipling, "The White Man's Burden."

Exploitative Colonialism

Exploitative colonialism is an economic system in which the colonizers seek to exploit the economic resources of the colony while incurring the lowest possible cost themselves. Agricultural plantations, mining operations, and manufacturing plants are typical of exploitative colonialism. Government

and other institutions exist to support the economic endeavor.

Most nineteenth-century Asian and African colonies were run on the exploitative pattern. The colonial power established a new political, economic, and social structure in the colony in the service of economic exploitation. Colonial policy was set in the home nation for the home nation's benefit and with little concern for the colony. The colony was ruled by a small elite group of Western officials, businessmen, farmers, and missionaries who lived apart from the indigenous population in urban enclaves designed and built in European style. In British Nigeria in the 1920s, for example, there was one British official for every 100,000 people. The colonizers often ruled indirectly through favored local leaders who were expected to maintain order, recruit laborers, and collect taxes and food for the colonists. The local leaders and their families, in turn, received preferential treatment. The colonizing power typically made use of a divide-and-rule strategy in which local ethnic groups were pitted against one another so as to forestall organized resistance to colonization.

Colonialism drew the colonies into the expanding world economic system. The colonizers sought land, the products of the land, mineral wealth, and cheap labor. They also sought to use the colonies as a market for goods produced in the home nation. This activity stimulated economic expansion in the colonies, but nearly all wealth flowed to the home nation. There was relatively little economic opportunity for the colonized peoples. Some might find employment as low-level civil servants or as domestics in European households, but most remained farmers or were forced to work in mines or factories. "Middleman minorities"—people from distant ethnic groups encouraged to settle in the colony to fulfill various roles—were employed. Asian Indians, for example, filled this role in British colonies in Africa and the Caribbean.

Settlers and Settler Colonies

In many colonies, there were some people from the home nation who chose to live in the colony and make it their home. Many in the first generation of

settlers saw the new land as their home, and this feeling intensified with successive generations when the latter were permitted to grow up in the new land. In some colonies, such as the United States and New Zealand, the settlers became the largest and dominant group, displacing the indigenous peoples and taking their land. In many other colonies, such as the British colonies in Africa, settlers formed small enclaves, established large farming operations, and lived in relative peace with the indigenous population. Settlers supported independence movements as they, too, saw themselves as suffering from the home country's economic exploitation. Once independence was achieved, however, settlers and indigenous populations often found themselves on opposite sides of issues such as land reform.

Resistance

Colonized peoples rarely accepted colonization without a fight. Revolts, massacres, destruction of property, and the like were common in the first stages of colonization. Revolts were met with force—the military and police were key enforcers of colonial rule—and were rarely successful. Later, more serious resistance took various forms, such as the civil disobedience led by Mohandas Gandhi that helped India achieve independence, the Ghost Dance movement in North America, the Boxer Rebellion in China, the Zulu Wars in South Africa, the Mau Mau movement in Kenya, and the Maroon wars in Jamaica. Local Christian churches were often used as vehicles of resistance to oppression and inequality. Educated members of the local population often contributed to the struggle through poetry, literature, and the media.

Costs and Benefits of Colonialism

There is little dispute that the colonizing nations benefited from colonialism, while the colonies suffered—and often continued to suffer after independence. Nonetheless, some scholars argue that there were benefits to the colony. While colonizers depended

on slavery in some regions, such as the Americas, they also ended it in many regions. Arguably, other benefits of colonialism included control of regional wars and the establishment of a political and economic structure and infrastructure that allowed for postcolonial modernization and democratization. But those claims are contentious: others argue that the economic and political structure and infrastructure of colonialism were meant to serve the colonists and had little positive impact on the local populations following decolonization.

The list of the costs of colonialism, on the other hand, is a long one. It includes massive loss of life through disease, relocations, and slavery; inhibition of local economic growth; new ethnic rivalries and conflicts; psychological damage to the colonized people, reflected in increased suicide and homicide rates; disruption of indigenous kinship and family relationships; a reduced role for women; and destruction of craft specializations as crafts were replaced by imported goods.

Decolonization

By the end of the twentieth century nearly all European colonies had become independent nations. The United States was among the first of the colonies to declare independence, which it achieved with its 1783 victory in the Revolutionary War. Many Spanish colonies in the Americas followed suit in the nineteenth century. For the African, Asian, and Pacific colonies of Britain, France, and Germany, decolonization came in the mid- to late twentieth century, most often as a result of disruptions and political realignments following World Wars I and II.

Decolonization typically takes one of two forms. In the first, exemplified by the United States and Canada, settlers, desiring political and economic independence, sought the end of colonial control. With the mother country no longer in power, the settlers were free to rule their own newly established nation. This independence generally had no benefits for the original inhabitants of the land, however, who continued to find themselves marginalized and pushed out of territories desired by the growing

European-descended population. This was the general pattern throughout the Americas, Australia, and New Zealand. The slave revolt in Haiti that led to independence in 1804 was one notable exception to that pattern.

The other form of decolonization was more common and involved the indigenous, colonized people retaking control of their territory. In most regions it was a long process that often involved violence. At first, requests for more autonomy were generally rejected by the colonizer; somewhat later limited reforms that provided a degree of home rule were often initiated. Finally, the colonial government would leave and the indigenous people would establish their own government and take control of the economy.

The period following decolonization was difficult for most new nations. Old ethnic rivalries for power surfaced, there were often conflicts between settlers and indigenous populations, the numbers of people with the education and experience necessary to run the government and economy were often insufficient to meet the need, and the newly independent countries often lacked the capital to support needed infrastructure and social-welfare development. For many colonies that achieved independence from the 1960s onward, political unrest, a succession of governments, dictatorial rule, poverty, population dislocations, and civil war have followed decolonization.

Decolonization also had a profound effect on many former colonial powers. The loss of low-cost raw materials and a ready market for products caused economic difficulties, although established economic relations between the colonizer and former colony rarely disintegrated entirely. Britain, the Netherlands, and Portugal all created unions of former colonies that helped keep those relations intact. Former colonial powers have also had to absorb millions of immigrants from their former colonies. Some were from favored ethnic groups who fell from favor in the new power structure; others came to the colonial home country in flight from civil wars, revolts, and poverty; many were simply seeking a better life. As a result of the influx of immigrants from former colonies, Britain, the Netherlands, and France have

become multicultural nations with sizeable minority populations—and now face all the attendant questions and problems of racism, minority rights, diversity, cultural norms, and freedom of religion and expression.
